though these costs can be considerable. They might be such that the country *shouldn't* specialize in that good, i.e. that its comparative advantage has been misidentified because of the biases and inefficiencies of the market. He also notes that “the theory of comparative advantage is usually interpreted as implying that a country should specialize even more in its traditional export products, since those would presumably be the industries in which the country enjoys a comparative advantage. But underdeveloped economies are less developed precisely because they have lower levels of productivity than other economies enjoy. If less developed economies further specialize in the sectors they have always specialized in, it may well be *less* likely that they will find ways to increase their productivity.” Japan and South Korea, for instance, were smart enough not to accept their old comparative advantages but instead to *create* new ones in industries where it would be easier to achieve large productivity increases. Industries like cars and steel and then, later, electronics and computers. Productivity increases were easier in these industries than in Japan’s old comparative advantage of textile production.

International trade also tends to increase global inequality. The terms of trade between countries are usually such that countries that were better off in the first place get most of whatever efficiency gains there are in trade. The main reason for this is that productive capital is more scarce globally than labor, so that relatively poor labor-rich (“southern”) countries have to compete among themselves for the scarce machines of the capital-rich (“northern”) countries. This gives the latter power to dictate the terms of trade, which therefore end up being disadvantageous to labor-rich countries. Also, if capital-intensive industries are characterized by a faster pace of innovation than labor-intensive industries, the terms of trade will deteriorate for southern countries. Third, if markets are not all equally competitive but instead northern exporters have more market power than southern exporters, the terms of trade will be even worse for the latter than in competitive markets.

Trade also increases inequality *within* countries. Mainstream trade theory itself explains why, at least with regard to rich northern countries. “According to Heckscher-Ohlin theory, countries will have a comparative advantage in goods that use inputs, or factors of production, in which the country is relatively abundant. But this means trade increases the demand for relatively abundant factors of production and decreases the demand for factors that are relatively scarce within countries. In advanced economies where the capital-labor ratio is higher than elsewhere, and therefore capital is ‘relatively abundant,’ Heckscher-Ohlin theory predicts that increased trade will increase the demand for capital, increasing its return, and decrease the demand for labor, depressing wages. Of course this is exactly what has occurred in the U.S., making the AFL-CIO a consistent critic of trade liberalization. In advanced economies where the ratio of skilled to unskilled labor is higher than elsewhere, Heckscher-Ohlin theory also predicts that increased trade will increase the demand for skilled labor and decrease the demand for unskilled labor and thereby increase wage differentials.”

However, Heckscher-Ohlin theory can’t explain rising inequality in less developed economies. In fact, it predicts the opposite; unskilled labor should get higher returns from trade because that is what those countries are relatively abundant in. The problem is that H-O theory, like all theories, is *ceteris paribus*, ignoring dynamics that in this case overpower the theory. Specifically, decades ago large amounts of land in the third world had a sufficiently low value that billions of peasants could live on them without trouble from local economic and political elites who *now* want to use the land for valuable export crops. So peasant squatters are no longer tolerated. The “Green Revolution” -- which made much of the rural labor force redundant in third-world agriculture -- globalization, and export-oriented agriculture have increased the value of third-world land, so billions of peasants have been driven out of rural areas into megacities where they apply for new labor-intensive manufacturing jobs produced by trade liberalization and international investment. But there are far fewer jobs than ex-peasants who need them, so wage rates are falling, not rising.

International investment, like trade, can either increase or decrease global efficiency and inequality. But it usually comes with the bad, not the good. Direct foreign investment can be very profitable for investors, but, contrary to what mainstream economists think, that isn’t necessarily because the plant and machinery are more productive in third-world countries than they would have been at home. It could be because the bargaining power of third-world workers is even less than that of their first-world counterparts.

Or because third-world governments are so desperate to woo foreign investors that they offer large tax breaks and lower environmental standards. Similarly, international *financial* investment can lead to huge efficiency losses, for example when investors panic and sell off their currency holdings, stocks, and bonds in an “emerging market economy,” which can erase all the gains that had been made over many years.

International investment also usually increases global inequality. “Global efficiency rises when international loans from northern economies raise productivity more in southern economies than they would have raised productivity domestically. But when capital is scarce globally, competition among southern borrowers drives interest rates on international loans up to the point where lenders capture the greater part of the efficiency gain.... So even when international financial markets work smoothly and efficiently, they usually increase income inequality between countries.” But when they don’t work smoothly and efficiently, it’s even worse. For instance, international financial crises give foreign investors the opportunity to buy up businesses at very cheap prices. Hahnel explains the “great global asset swindle” as follows: “International investors lose confidence in a third-world economy, dumping its currency, bonds, and stocks. At the insistence of the IMF, the central bank in the third-world country tightens the money supply to boost domestic interest rates to prevent further capital outflows in an unsuccessful attempt to protect the currency [i.e., to prevent it from depreciating more]. Even healthy domestic companies [as a result] can no longer obtain or afford loans, so they join the ranks of bankrupted domestic businesses available for purchase. As a precondition for receiving the IMF bailout, the government abolishes any remaining restrictions on foreign ownership of corporations, banks, and land. With a depreciated local currency and a long list of bankrupt local businesses, the economy is ready for the acquisition experts from Western multinational corporations and banks who come to the fire sale with a thick wad of almighty dollars in their pockets.”

As for *efficiency*, empirical data prove that neoliberal policies have not accelerated world economic growth. Growth rates were much higher in the Bretton Woods era than they have been in the neoliberal era.

Hahnel’s remarks on balance-of-payments accounts and exchange rates are illuminating. I won’t summarize them all. A surplus on the account is when there is a net inflow of a country’s currency into that country, due, in the case of the trade account, to greater exports than imports. (With U.S. exports, for instance, dollars flow into the country from the international currency market, because foreigners have to pay for U.S. goods with dollars. So they trade their own currency for dollars in foreign exchange markets and then send those dollars into the U.S.) A deficit is when there is a net outflow of the country’s currency because of higher imports than exports. (There are also short-run and long-run capital accounts, which have to do with international investment.) “If the U.S. runs a \$100 billion balance of payments deficit in a given year this means that there are 100 billion more dollars in the international currency market at the end of the year than there were at the beginning of the year -- and we would expect the value of the dollar to fall in foreign exchange markets, *ceteris paribus*.” That is, the dollar will exchange for fewer yen, francs, pesos, etc., because there are more dollars in the currency market. I guess you could say there has been inflation with respect to the dollar in the currency market, so one dollar buys fewer “goods,” i.e. currencies, than before. Conversely, I suppose a balance of payments deficit entails disinflationary pressures in the home market, because there are fewer dollars (for example) in the U.S. to pay for goods. [Is that right??] And because a dollar exchanges for fewer yen and so on, imports will be relatively more expensive. Which will tend to cause a decline in imports -- as exports increase because of the dollar’s (and hence American products’) relative cheapness -- which will lower the balance of payments deficit or even lead to a surplus. So you see that the market has equilibrating tendencies.

A balance of payments surplus, on the other hand, means there are fewer dollars (say) in the foreign exchange market and more in the U.S., which surely entails inflationary pressures (and/or pressures for the dollar to appreciate). And with inflation or dollar appreciation, U.S. goods and services become more expensive in international terms, which means that exports decline and imports increase -- because now international goods are relatively cheaper for U.S. consumers to buy -- which reduces the balance of payments surplus until, perhaps, it becomes a deficit and the dollar depreciates because the foreign exchange market is flooded with dollars. (Dollars flow out of the U.S. and into the currency market where they exchange for other currencies with which to buy imports.) This depreciation reduces the incentive for U.S. consumers to buy imports and increases the incentive for foreigners to buy U.S. goods. So dollars flow

back into the U.S., the domestic economy is stimulated, maybe the balance of payments account returns to a surplus, and inflationary pressures return. Etc.¹

Another useful comment: “When domestic interest rates fall relative to interest rates in the world, fewer foreigners will invest their financial wealth in a country, and more domestic wealth-holders will invest abroad where interest rates are higher. Conversely, a rise in domestic interest rates relative to the rest of the world induces an inflow of foreign financial investment in response to the higher interest payments, and reduces the outflow of domestic financial investment.”

Stuff about the IMF:

In exchange for a “bailout loan” that allows the country to pay off international loans coming due that it would otherwise have to default on, IMF “conditionality agreements” typically demand that the recipient government reduce spending and increase taxes, and the central bank reduce the money supply -- in addition to demanding removal of restrictions on international trade and investment and foreign ownership. Since the economy is invariably already in recession, fiscal and monetary “austerity” further aggravate the recession. Reducing government spending and increasing taxes both decrease aggregate demand, and therefore decrease employment and production. Reducing the money supply raises interest rates, which reduces investment demand and further decreases aggregate demand, employment, and production....

....The IMF policies are designed to increase the probability that the country will be able to repay its international creditors, and make perfect sense once one realizes this is their goal. If the government is in danger of defaulting on its “sovereign” international debt, forcing it to turn budget deficits into surpluses provides funds for repaying its international creditors. If the private sector is in danger of default, anything that reduces imports and increases exports or increases the inflow of new international investment will provide foreign exchange needed for debt repayment. Deflationary fiscal and monetary policy reduces aggregate demand and therefore inflation, which tends to increase exports and decrease imports. By reducing aggregate demand, deflationary fiscal and monetary policy also reduces output and therefore income, which further reduces imports. Tight monetary policy raises domestic rates, which reduces the outflow of domestic financial investment and increases the inflow of new foreign financial investment, providing more foreign exchange to pay off the international creditors whose loans are coming due. Finally, since all in the country who owe foreign creditors receive their income in local currency, anything that keeps the local currency from depreciating will allow debtors to buy more dollars with their local currency, which is what they need to pay their international creditors. IMF austerity programs are well designed to turn stricken economies into more effective debt repayment machines as quickly as possible.

International economic considerations can help explain political behavior that might otherwise seem paradoxical or stupid. Hahnel gives the example of Jimmy Carter reneging on his campaign promise to prioritize the fight against unemployment over the fight against inflation. His betrayal of this promise was partly responsible for his loss to Ronald Reagan. So why did he do it? In part because of reasons having to do with the balance of payments. In 1977 the U.S.’s trade account deficit was increasing, which put downward pressure on the value of the dollar. “What made this particularly worrisome was that Saudi Arabia was Washington’s ally inside OPEC and had prevented the OPEC oil price increases from being even greater by increasing its own production and sales. Since the oil price increases were widely believed to be responsible for a substantial part of the stagflation -- rising unemployment *and* rising inflation -- that rocked the European and U.S. economies in the 1970s, Carter deemed it critical to persuade the Saudis not to abandon their opposition to the majority of their Arab brethren in OPEC who wanted to cut world supplies

¹ [I don’t trust my analysis. I’m an idiot at economics.]

and boost oil prices even further. But the Saudis were asking why they should continue to trade oil for dollars if the value of the dollar was going to continue to fall -- as it surely would if U.S. trade deficits continued to rise." If the dollar was going to continue to fall, it was better for the Saudis just to leave more oil in the ground where it could only increase in value. Now, if Carter had tried to aggressively combat unemployment this would have increased production and income but also imports (and inflation, I guess?), and thereby increased the trade deficit even more. So he adopted deflationary fiscal policies, which caused the trade deficit to disappear in the recession of 1980. Thus he defended the value of the dollar in order to prevent oil prices from rising even more. (The poor guy was caught in a double bind. Had he adopted expansionary policies, the Saudis would have let oil prices rise, which would have exacerbated inflation and maybe unemployment too, since high oil prices were probably partially responsible for high unemployment. (Right?) So he adopted deflationary policies, which led to higher unemployment. There was no way out for him, it seems.)

Carter also "betrayed" progressives by reappointing Paul Volcker as chairman of the Fed, which he did to show the Saudis he was serious about shoring up the dollar. "The only way to [raise the dollar's value] quickly was to raise U.S. interest rates significantly above world levels to induce a massive inflow of finance capital on the short-run capital account to counter the trade deficit until it could be reduced." Incidentally, the reason why Volcker's raising of interest rates apparently contributed to the 1980s debt crisis in third world countries is, I suppose, that in order to attract finance capital, these countries had to raise their interest rates too, which led to debilitating levels of debt.

In the penultimate chapter Hahnel demolishes Milton Friedman's apologetics for capitalism. He points out, for example, that the market isn't "free, voluntary, and non-coercive" if people come to it with different amounts of capital. In a sense, yes, employees have freely chosen to work for someone else. But they have been coerced into having to make that unpleasant decision by their relative lack of capital. It is either rent yourself out or starve.

It's usually wrong to say that powerful institutions don't work well or that powerful people and bureaucrats are incompetent. They're actually quite competent at fulfilling their real goals, which are rarely the ones they announce to the public. And their institutions do what they're supposed to; they serve the interests of those who control them. For example, a stagnant economy is in the interest of many of the most powerful institutions in society, for various reasons; hence the economy is allowed to remain stagnant, and institutions do not function to make it more dynamic. Before 9/11 the CIA didn't prioritize the fight against terrorism, as scholarship proves; the terrorist attack therefore didn't prove the CIA's "incompetence." What it proved was the agency's lack of concern for the population. Under Cheney, too, the hunt for bin Laden wasn't a top priority, as shown by the fact that he passed up good opportunities to get him. Bin Laden's existence was useful to Cheney as a tool for instilling fear in the public. Intelligence agencies weren't really incompetent with regard to the whole "weapons of mass destruction" fiasco; they understood that Hussein wasn't manufacturing WMDs. But Cheney and Bush wanted to go into Iraq for strategic reasons (to get control of oil reserves with which to influence global politics, etc.), so they manufactured whatever reasons they thought would work. First WMDs, then promoting democracy. It's true they didn't achieve their maximal goals, but that was because of unexpected massive popular resistance by Iraqis -- not the sectarian violence but peaceful protest movements unreported in the U.S.'s mainstream media.

Individuals in elite institutions can be stupid in many ways, but they do their jobs fairly well as determined by institutional priorities, which is why they have high positions to begin with.

Reading *The Tyranny of Oil: The World's Most Powerful Industry -- and What We Must Do To Stop It* (2008), by Antonia Juhasz. Eye-opening. It seems to me that most of the corporate mergers that have been going on for the last thirty years, especially in the oil industry, as well as all kinds of oligopolistic practices that go on constantly, patently violate the Sherman Antitrust Act (1890), the Clayton Antitrust Act (1914), the Robinson-Pattman Act (1936), and others. The fact that the FTC has been more or less in the pocket of big business doesn't mean that all these corporate executives aren't technically felons. Bill Gates included. The recent wave of mergers and concentration has probably been as bad as, or worse than, the one a hundred years ago.

Price-fixing, collusion, conspiracy, fraud of every kind.... The corporate world is a pure swamp of illegal activities. It's the jungle. Lawlessness on a scale that puts organized crime to shame. The laws are just not enforced -- because their enforcement would mean the end of American capitalism. Literally. Especially when you take into consideration all the illegal union-busting that goes on everywhere, the illegal intimidation of workers, illegal firings, illegal disregarding of safety and environmental regulations, and illegal or illegitimate forms of political funding and manipulation, and on and on. And all the stuff that Naomi Klein documents, all the egregious stuff that goes on with the IMF and the WTO and the CIA serving corporate agendas and paramilitary forces in Latin America and illegal wars started partly on behalf of the oil industry.... The upper echelons of America and the world are teeming with literal criminals. Capitalism simply will not be constrained by law. It is too explosive; it has to burst the law's straitjacket constantly. Something as quaint as *law* stands no chance against the most powerful forces in world history.

Reading this book makes one very angry. The history of the oil industry is unbelievable. What these institutions do. Destroying millions of lives, destroying communities and the environment, destroying economic independence and competition, destroying democracy. Under Bush the energy industry had one long orgy.

Aniela and I are in Forli for a day, whence we're going to Bologna, then Lucca in Tuscany to meet my parents, then Florence, then Assisi, then Spello, and then Pisa to catch a plane to Krakow. Forli is utterly charming, full of winding alleys like in Venice and wonderful architecture, a much more human place than any in America.

Lightly skimming two bestsellers because they're not theoretically interesting, *Globalization and Its Discontents* (2002), by Joseph Stiglitz, and *A Paradise Built in Hell: The Extraordinary Communities That Arise in Disaster* (2009), by Rebecca Solnit. It's usually a mistake to buy bestsellers, but I needed something to read. The first book is about the criminal follies of people in power¹ -- in the IMF and the U.S. Treasury -- while the second is about the magnificent humanity of the un-powerful in the wake of natural and manmade disasters. Conventional wisdom, propagated by the media and power-structures, says that during disasters people revert to savagery and have to be controlled by governments and the police. This book puts forward the opposite view, the commonsense view that people tend to become remarkably altruistic in disasters and that it is the people in power who behave savagely. Disasters bring out the best in most of us -- because we're no longer constrained by barbaric institutions but in the absence of social order are able to act as human(e) nature dictates, compassionately and helpfully toward those most in need. In the coming decades, as natural disasters occur more frequently and with greater intensity, the lessons of this book will become ever more relevant.

Stiglitz, who, shockingly enough, has *some* (not much) intellectual integrity despite being mainstream, proves that Chomsky's view of the IMF as merely a branch of the U.S. Treasury is spot-on. And the Treasury is basically a branch of Wall Street. In recent decades the IMF has rivaled the oil industry in its destructive impact on humankind. Stiglitz also observes that the World Trade Organization is just as dominated by commercial interests as the IMF is by financial. "Just as the IMF gives short shrift to the concerns of the poor -- there are billions available to bail out banks, but not the paltry sums to provide food subsidies for those thrown out of work as a result of IMF programs -- the WTO puts trade over all else. Those who seek to prohibit the use of nets that harvest shrimp but also catch and endanger turtles are told by the WTO that such regulation would be an unwarranted intrusion on free trade."

The evolution of the IMF and the World Bank has been ironic. They were originally Keynesian institutions fully cognizant of market failures. The IMF's mission was to prevent another global depression, in part by lending to countries facing an economic downturn so that their level of aggregate demand could be maintained and a depression be averted. According to Stiglitz, the World Bank (or International Bank for Reconstruction and Development) for decades took seriously its mission of alleviating poverty by limiting itself to giving loans for projects like building roads and dams. In the late 1970s things changed.

¹ To be exact, their policies are "follies" if their goal is the IMF's stated purpose of helping to stabilize societies undergoing economic crises; if, on the other hand, their goal is the IMF's real function of protecting Western investors, opening up countries to Western investment, etc., they're not "follies" at all but perfectly rational.

“Founded on the belief that there is a need for international pressure on countries to have more expansionary economic policies -- such as increasing expenditures, reducing taxes, or lowering interest rates to stimulate the economy -- today the IMF typically provides loans only if countries engage in policies like cutting deficits, raising taxes, or raising interest rates that lead to a contraction of the economy.” Ironic, eh? The World Bank has become more intertwined with the IMF than before, now giving “structural adjustment loans” to countries that accept IMF-imposed conditions. And after the fall of Communism, both institutions, though especially the IMF, guided the transition to capitalism. Badly. The point is that, far from facilitating global stability, they have evolved so as to create and exacerbate instability. Because that serves the interests of the institutions whose servants they are. (It used to be that these latter institutions, particularly financial sectors, had an interest in stability; in the 1970s and 1980s, as you know, that changed, when regulations were dismantled and instability became wildly profitable.)

*

The phenomenology of greeting someone.-- Hand-shaking and hand-waving as greetings are amusing to think about. Two selves approach each other; they wave at each other, or they shake hands. What is happening there? What is the significance of these hand motions? Common sense says they signify recognition, and common sense is right. But the matter is deeper than some such glib statement. Two selves are together in the same room or the same elevator or the same area; until they show that they recognize each other as selves, a subtle tension is quite possibly in the air. Coming in contact with the other....but not acknowledging or being acknowledged by him or her (or them)....can produce a slight or mighty dissonance in the mind. The moment can be uncomfortable. So then someone breaks the silence and a mutual or collective sigh of relief is felt, and people joke together or engage in pleasant small-talk. The ice is broken. One has been confirmed as one has confirmed. One’s self-love has been at least weakly validated by the recognition of one as a self worth greeting. Similarly, with a hand-wave to another self in the distance....one moves one’s arm and hand from side to side, shakes them back and forth several times -- this seemingly comically arbitrary movement -- to indicate “I acknowledge you as a person, a self with enough value to be worth acknowledging, in the expectation or knowledge that you so acknowledge me.” And with the hand-shake....two hands clasped together moving up and down two or three times....two selves are meeting in mental space on apparently equal footing.

*

On Sam Harris’s book “The Moral Landscape.”-- “I will argue that morality can be considered an undeveloped branch of science.” “[I will show] how science can determine human values.” “The split between facts and values -- and, therefore, between science and morality -- is an illusion.” Great, here we go, good old-fashioned vulgar scientism. Let’s see what our esteemed New Atheist has to say. “Despite a widespread belief to the contrary, scientific validity is not the result of scientists abstaining from making value judgments; rather, scientific validity is the result of scientists making their best effort to *value* principles of reasoning that link their beliefs to reality.” “The very idea of ‘objective’ knowledge (i.e., knowledge acquired through honest observation and reasoning) has values built into it, as every effort we make to discuss facts depends upon principles that we must first value (e.g., logical consistency, reliance on evidence, parsimony, etc.)” It is never a good idea for a pygmy like Harris to take on a giant like Hume. Yes, Mr. Harris, you are right that scientists value reason and that the pursuit of objective knowledge presupposes certain values. One cannot reason without implicitly valuing reason, just as one cannot drink water without implicitly valuing water or the drinking of water. Even so, to drink is not to value, as to reason is not to value. Said differently, value or valuing is an internal constituent neither of water nor of reason.¹ Every human act incorporates value, but the object of the act itself is distinguishable from the value

¹ By drinking water one interacts with water, just as by reasoning one can be said to interact with reason. For my purposes, the cases are analogous.

one assigns to it. The idea of objective knowledge does not have values built into it; it means awareness of truth, a definition that makes no reference to the concept 'value.' *Obviously* scientists value principles of reasoning; the point is that one cannot *prove* or *test* this value, the notion of doing which is either meaningless or question-begging.

*

The sovereign of nature.-- A case can be made that the human brain, or certainly the human body, is the most complex structure in the universe.

*

Chomsky speaks.-- "The main domestic function of the Pentagon has always been to transfer funds to high-tech industry. MIT is part of that funnel, part of the funnel by which the public unwittingly pays the costs of high-tech industry. The whole of the modern economy, if you look through it, is crucially based on this. So the Pentagon's budget [in the mid-1990s] has to not only stay [despite the federal government's balanced-budget obsession] but in fact go up [as it did]." The other part of the budget that went up in the mid-'90s, he remarks, was funding for prisons, in part as a tool of "social cleansing" and instilling fear (of crime) in the public¹ and in part because the prison system is a fairly significant Keynesian stimulus for the economy.

As for the obsession with the national debt, in the 1990s the debt actually wasn't massive compared to what it had been in the 1950s, parts of the 1800s, etc., when relative to GDP it was sometimes much higher than in the 1990s.

*

On Slavoj Žižek.-- I've only read a little about his ideas and skimmed a chapter from one book, but skepticism of fashionable thinkers (especially postmodernist ones) is always in order. Their fame, after all, has no implications with respect to the value of their work -- except possibly negative implications. What makes a living thinker famous, aside from luck and "connections," is his appropriateness to existing institutions, his successful embodiment of fashionable norms. The norms may be valuable or they may be worthless; but there are innumerable examples of thinkers who were famous in their day who are now forgotten because their ideas had little value. One can almost say it is accidental if a fashionable thinker is also objectively worthy. Noam Chomsky is such a happy accident -- although even he has always had to fight an uphill battle. Kant was another such accident, famous in his day; so, eventually, was Hume (not truly recognized until later in life), and Leibniz and Descartes. -But even those guys are maybe not great examples, because my critique does not really apply to natural scientists and mathematicians, with regard to whom "fashion" is necessarily less fickle or "merely institutional." The point is that if I ever read Žižek it will not be because I expect much.

*

Chomsky speaks.-- In a market system, your dollar is your vote. You have as many votes as you have dollars. If you have zero dollars, you have zero votes. Unborn generations have zero dollars, so what happens to them is of zero significance in a market system. What's done today, they have to live with. If

¹ Such functions need not be consciously in the minds of lawmakers when they design their policies -- although quite possibly they are, at least "in the back" of their minds. But the point is that the policies are thought to be having positive effects on social stability etc., and that certain interests are lobbying for their extension. (Maybe ordinary constituents who are afraid of all the black people they see everywhere, or businesses convinced of the economic and social value of prisons, or whatever.)

we destroy resources, they have to live with it. So to the extent -- the limited extent -- that market systems are allowed to function, they're just guaranteed to self-destruct. That's why if you take a look at modern history, in countries that were more or less organized and functioning they never allowed market systems to function. In Britain there was an experiment with laissez-faire around the 1860s and 1870s, but it was called off very quickly by the business world because they saw it was going to wipe out communities and the environment. What they instituted in its place was a kind of social democratic system. (See *The Great Transformation*.)

*

Quotations from the footnotes to Chomsky's "Understanding Power."-- Chapter 6: "[Thomas] Jefferson did not support capitalism; he supported independent production.... The fundamental Jeffersonian proposition is that 'widespread poverty and concentrated wealth cannot exist side by side in a democracy.' This proposition is dismissed by liberals making peace with the rich and coming to terms with inequality, but Jefferson perceived the basic contradictions between democracy and capitalism.... In 1817 he complained that the banks' mania 'is raising up a monied aristocracy in our country which has already set the government at defiance....' A year earlier he said he hoped the United States would reject the British example and 'crush in its birth the aristocracy of our monied corporations which dare already to challenge our government to a trial of strength and bid defiance to the laws of our country....'" "Men divide naturally into two parties, 'aristocrats and democrats,' [Jefferson] wrote. On one side stood 'those who fear and distrust the people, and wish to draw all powers from them into the hands of the higher classes'; on the other stood 'those who identify with the people, have confidence in them, cherish and consider them as the honest & safe, altho' not the most wise depository of the public interests....'"

Chapter 7: "Shorn of almost two centuries of 4th-of-July oratory, [the American Revolutionary War] was a military operation fought by a very small armed minority -- at almost no time did Washington's forces exceed 8000 men in a country which had at least 300,000 able-bodied males -- and backed by a force of 31,897 French ground troops and 12,660 sailors and Marines manning sixty-one major vessels. The total cost of the campaign to the French (almost \$2 billion) drove the French monarchy into bankruptcy and subsequent revolution. But politically, the French had achieved exactly what they had intended to do: they had temporarily shattered Britain's position of pre-eminence not only in America but in Europe as well."

Chapter 2: El Salvador under the U.S.-client regime in the 1980s: "Tonita is a peasant from Santa Lucia, a rural village near the volcano of San Vicente in El Salvador. One day, two years ago, at 11:00 A.M., Tonita left her one-room home to carry lunch to her husband, Chepe, and their two teenage sons who were cutting firewood on the volcano. She left her three smallest children -- an 18-month-old daughter, a 3-year-old son and a 5-year-old daughter -- in the care of her sister and mother.... Entering the house [on her return], Tonita was greeted by the grisly spectacle of a feast macabre. Seated around a small table in the middle of her house were her mother, sister and three children. The decapitated heads of all five had been placed in front of each torso, their hands arranged on top, as if each body was stroking its own head. This had proven to be difficult in the case of the youngest daughter. The difficulty had been overcome by nailing the hands onto the head. The hammer had been left on the table. The floor and table were awash with blood. In the very center of the table was a large plastic bowl filled with blood; the air hung heavy with its sweet, cloying smell. Tonita's neighbors had fled when the Salvadoran National Guard began their killing. The *Guardia* had not tried to stop the people from fleeing and, indeed, they encouraged it. One neighbor, Doña Laura, returned for Tonita and found her standing in the doorway, moaning and staring at her decapitated mother, sister and children.... This is only one tableau of many. Other *scènes macabres* have been created by the armed forces in their 10-year exhibition of horror and death. People are not just killed by death squads in El Salvador -- they are decapitated and then their heads are placed on pikes and used to dot the landscape. Men are not just disemboweled by the Salvadoran Treasury Police; their severed genitalia are stuffed into their mouths. Salvadoran women are not just raped by the National Guard; their wombs are cut from their bodies and used to cover their faces. It is not enough to kill children; they are dragged over barbed wire until the flesh falls from their bones while parents are forced to watch."

*

More thoughts on materialist common sense.-- I've said this before, but to emphasize its importance I'll say it again. That the relations of production (which presuppose given levels of technology, scientific knowledge, etc.) are effectively the "base" of society should be a totally uncontroversial proposition. To think that intellectuals have debated it for decades is mind-boggling. All you have to do is reflect that the institutions and institutional actors with the greatest access to resources are going to have the greatest influence over society. Fewer resources, less influence. Institutions directly involved in the production and reproduction of resources -- of money, capital, technology, etc. -- are naturally going to have the most direct access to these resources, i.e. the greatest control over them. The actors who control these institutions, then, are going to have more power than other actors, and they will seek to make institutions in the rest of society "compatible" with their power or subservient to it. Which means making them compatible with the form of organizing relations of production in that society that has the most control over the most resources. In other words, the "dominant mode of production." In non-prehistoric societies, the class structure and implicit class struggle, which are defined by the relations between antagonistic positions in the mode of production, will therefore be central to social dynamics. The more exploitation of the producing class(es), the more power in the hands of the exploiting class(es), i.e. those who occupy the dominant positions in the dominant mode of production. (Their dominant position is a function of their control over the resources necessary to force others to produce for them.) The exploiters will try to increase exploitation as the exploited try to diminish it. The vicissitudes of this struggle will go far towards explaining other political and cultural phenomena, because the struggle -- which is integrally connected to the evolution of the relations of production, of the class structure, of economic institutions, as well as the closely related evolution of the forces of production -- largely determines who has how many and what kinds of resources when, what sorts of institutions and values the people with resources will promote, etc.

It is true that in other senses, the biological division between the sexes can be called the "foundation" of society. But not if you're talking about the specific forms that particular societies take. Biological facts do not explain that (do not explain differences between societies); economic institutions -- in addition to environmental circumstances and the nature of existing productive forces -- do, at least to a very rough approximation. (One also has to keep in mind Raymond Williams's concept of the "residual," the cultural, political, and economic residues of previous systems, as well as the sheer infinite complexity of a society's economic institutions, including the coexistence and even interpenetration of different modes of production.)

To take a non-capitalist example, in the Middle Ages the Church owned vast tracts of land and had immense wealth. As a consequence, it had enormous influence over the whole society. What could be more commonsensical? The Church's and the feudal aristocracy's ability to force others to work for them and to appropriate their surplus product allowed them to impose their institutions, norms, and values on the rest of society. Their control over the means of violence was necessary, of course, to their economic power -- and was in turn the result of prior economic facts, prior accumulation of resources by certain people and institutions, etc.

*

It seems to me that to write about oneself nowadays, to write a memoir or some other such thing, is self-indulgent. Who cares anymore? A Christopher Hitchens (who just lost his voice, finally, due to cancer¹) is a self-absorbed child, writing about all his glamorous experiences, the people he has known, his love of smoking and drinking, his exciting life. Humanity is at the edge; self-fixation is comical. Literature

¹ Unfortunately he can still write. Attacking Chomsky, for example, as a leader of the "paranoid anti-war left" and so on. (Is Malalai Joya, the young Afghan heroine of peace and human rights, who idolizes Chomsky, another leader of the paranoid anti-war left?)

itself, as I've said before, has come to seem a bit false or pointless or anachronistic. When everything is *urgent* and *serious*, is literary play not somehow inauthentic and "forced"? An author spending weeks, years creatively writing in solitude, agonizing over the right words, agonizing over characters and plots, all the while strongly suspecting that society does not care anymore, his work is "irrelevant" and will be forgotten. Writing fiction is no longer a culturally central activity but now feels self-indulgent, ego(t)istic rather than "altruistic" (see Susan Sontag's idea of "true culture"), part of the problem and not the solution. These sorts of feelings may well have been a factor in David Foster Wallace's suicide. Of course good literature and good memoirs are still worth writing....but things have changed, sadly.

*

It should be clear from all I've said on the subject that the self and the internal(ized) abstract other are totally inseparable. Even analytically they cannot really be separated, because self-consciousness is self-otherness, and in order for such a thing to exist there has to be an "abstract" internalized other constantly present (implicitly) in consciousness. All this is fine, but it's disconcerting to think about deeply. When you react to something, for example, it isn't simply "*you*" reacting. It is also the other in you. You have spent your whole life internalizing people's behavior, such that when you act or react it is partly the internalization of all these people that is acting. You have learned what is appropriate in various situations, so you act in appropriate ways, in ways you think others will appreciate or as they would act themselves. Even in solitude your behavior is conditioned by others', and it is largely the other in you (which is a part of you) that is acting, or that is determining *how* you act.

And yet in all your acts there is also a "spontaneous" element, a primitively "authentic" or "purely you" element. There has to be, because you are a concrete being different from others. Maybe this element is what George Herbert Mead meant by the "I," as opposed to the "me." It is only implicit; you cannot be purely aware of it, because your awareness incorporates the other in you.

On another level, though, your whole self-expression in every moment -- every act, feeling, etc. -- is genuinely, authentically you. It is, after all, *your* self-expression. If you feel alienated or you feel as though you're always acting and not being yourself, *that* is authentically you, it is an expression of who you are at that time. It is impossible not to be yourself. -But in another sense -- or other senses -- it is definitely possible not to be yourself. I described one such sense above. In a way, we're never *just* ourselves; we're also others, having internalized other people's behavior. Sometimes in social situations you can be so self-conscious, so aware of others and concerned to please them, that you actually *feel* like you're not being yourself. You're not being "natural." This happens when the other in you, as *instantiated in* and *an internalization of* the people you're with, takes over your consciousness to such an extent that the "you" in you, or Mead's "I,"¹ the natural, spontaneous element, cannot express itself as it normally does but takes distorted, mutated, "nervous," "self-conscious" forms that might end up embarrassing you. The *other* blocks *you*, so to speak. I think that's a useful way to conceptualize it, maybe a psychologically or even biologically profound way. (These psychological divisions I'm talking about must after all have biological manifestations, which science will probably never understand.)

But of course all this is confusing, because your experiences with and internalizations of others have *formed* you. And you *are* an other to yourself, as shown by the fact that you can reflect on yourself and are at all times at least implicitly aware of yourself. So you are a self-other....but that formulation itself suggests that there is a "self" aspect in you and an "other" aspect and that they are somehow different -- even though in another sense they can't be, because you encompass both of them! Without the (internal) other there would be no you, only an animal consciousness. -Ugh, I'm tired of paradoxes.

After a certain point one loses interest in this sort of phenomenology because it is so difficult. Before giving up I'll just say that it's important to distinguish between senses of "other," even of the internal other. There is, first of all, the general abstract other that is always separating you from yourself, so making possible self-consciousness. Then there are the internalizations of specific people, which are really just your

¹ [I may have been conflating two different things.]

experiences of these people in addition to whatever unconscious significances they have for you. These people are for you instantiations of the general abstract other [that accompanies your consciousness], which is how it is possible for you to be aware of them as others at all. Then there is also your half-conscious or unconscious conception of what a “valuable” other is like, what traits he or she has that make him or her (or, more exactly, his or her self-regard) more real or confirmed (and so “significant” to you, hence worth getting recognition from) than other people. But this “conception” is not some definite idea but more like tendencies in you to react to certain kinds of people in certain ways. All your reactions are conditioned by this “tendential conception” of a valuable other; for instance, you might ignore some people because they don’t fulfill it, maybe because they seem like fools or buffoons or whatever. The relation between this “tendential conception” and the general abstract other in your consciousness is not entirely clear, as I argued in the section above called “At the risk of repetition...” Another kind of internal other is the psychological and biological “legacy” of all your experiences with people, especially in your formative years, experiences that helped shape you into who you are, that helped form your psychological constitution. All these kinds of “others” probably merge into one another in your mind. They are part of you but not all of you.

*

“The human harvest.”-- Peter Marin: “Kant called the realm of [human] connection the kingdom of ends. Erich Gutkind’s name for it was the absolute collective. My own term for the same thing is the human harvest -- by which I mean the webs of connection in which all human goods are clearly the results of a collective labor that morally binds us irrevocably to distant others. Even the words we use, the gestures we make, and the ideas we have, come to us already worn smooth by the labor of others, and they confer upon us an immense debt we do not fully acknowledge.” When you talk or think, you are channeling the past and other people. When you put on your clothes or drive your car or use your computer, you are relating yourself to a network of other people. We are all indebted to each other.

*

The cynic speaks.-- This life is not worth a potato, as Byron said (and Plato, Swift, Dante, Cervantes, Luther, Rochefoucauld, Wesley, Rousseau, Solomon, and countless others). Think of the professions, for example. To become (and then to *be*) a medical doctor or a lawyer you have to be not “intellectual” but an obedient drudge. To be a politician you have to be a liar, a panderer, and driven by power-hunger. To be a successful academic you cannot challenge institutional conventions -- as is true of every other job. To be a corporate executive you have to be obsessed with cost-cutting and money-making, and you have to be able to turn your back on humanity in a hundred different ways. To be a soldier you have to give up independent-mindedness and let yourself become a killing machine for hire. To be a scientist you have to be willing to spend your life immersed in unutterably tedious minutiae of theoretical or experimental research. To be a bus driver or janitor or fast-food employee or waiter or cleaning lady or secretary or receptionist or factory worker or clerk you have to tolerate exquisite boredom and subordination and the emptying of your mind (or maybe you don’t have much of a mind to begin with). It’s a wonderful world.

*

In *The ABCs of Political Economy*, Robin Hahnel criticizes Marxism for postulating that the economic sphere is the dominant one in all societies. He thinks that the issue shouldn’t be decided *a priori* but demands empirical investigation of particular societies. (He refers to a book co-written with Chomsky, who therefore probably agrees with him.) In one society, the “kinship sphere” might be dominant; in another, the political sphere. But this is confused. He is right to criticize Marxists for arguing that because every society needs to produce and distribute the material means of life, the economic sphere is “dominant” (whatever that means). That is not a valid argument. After all, biological reproduction is necessary too;

hence on this (flawed) reasoning, one could argue that kinship systems are dominant. But all this talk is riddled with confusions. First let's clarify the word "dominant." By using that word the Marxist means that relations of material production and distribution determine the form(s) of a society more than family relations do or political relations or some other set of cultural relations. This question of causal primacy, incidentally, is not the sort of thing that can be decided through empirical investigation. It is a matter of logic. It is inconceivable that merely by studying how a particular society was organized, an anthropologist could determine which sphere of social relations was primarily responsible for the society's total structure. How could such a conclusion be justified through an empirical description? The Marxist hypothesis is like Darwin's theory of natural selection, something we *bring to* the data to help interpret them. Actually, because this particular Marxist hypothesis has less cognitive content than the hypothesis of natural selection, it is even harder to imagine data disconfirming it than in the case of natural selection, which *can* be at least *modified* under the influence of data (as many Marxist hypotheses can, though not this one).

There are many reasons to think that the economy is causally primary; I gave one several days ago in the section above. Another is that social relations are mediated by, and constructed around, material things, which are produced and reproduced through economic relations. The specific form of the family will be strongly influenced by the sort of technology and physical structures that are available in a society, which are reproduced through a specific set of production relations. Thus the latter would seem to have more influence over how families are organized (*indirect* influence in *this* argument at least, influence mediated by the production of material things that are then used to express kinship relations) than vice versa.¹

Of course in some societies production relations might be expressed in part *through* family relations, production being organized along kinship lines, but the logical priority of production, of the physical world and physical things and their reproduction, remains. To speak functionally, the kinship organization of production persists because it is functional for production; it is not true, on the other hand, that the specific way of organizing production relations persists because it is functional for family reproduction or sexual reproduction. That idea is just outlandish. Sexual reproduction can easily accommodate itself to whatever system of production relations exists (and is in part *constrained* to exist given the particular natural environment and the nature of productive forces).

*

Anti-intellectual intellectuals.-- If intellectual curiosity means the desire to learn new things, encounter new ideas, explore and explain the world, then "intellectuals" have as little of it as other people do. They limit themselves to one field and do their job and earn their paycheck. In fact, most of them use their brain less than many "ordinary" people do.

*

Academia is unusual among institutions in that it presents many opportunities to show one's humanity. Few academics, however, seem to take these opportunities. For instance, most professors and teacher assistants are rigid about grades, refusing to change them if a student complains, being wedded to their arbitrary little standards of what constitutes good work. I try not to be like that. If a student presents even a moderately persuasive case for my raising his grade, even if it has to do with his desire to graduate or get on the Dean's List or something like that, as long as he has shown effort throughout the semester and his grade is not far below what he wants it to be, I will do so. Why should I be a prick and stick to the subjective little value-judgment I made earlier? If a student has shown he cares, then I'm perfectly happy to make him happy. Institutions are bullshit; their standards mean virtually nothing. At this late stage of history there is no excuse for not knowing that. But most professors are glorified bureaucrats, so they're oblivious.

¹ That might be a bad argument.

Think about it: these stupid little games we play have no significance, these letters and numbers and pathetic attempts to be objective and standardized and fixedly ordered about arbitrary little papers and tests and quizzes when the world is an immense absurd place. As for students who are creative and intelligent and do assignments in their own way that maybe doesn't *perfectly* embody the formula that the professor was looking for, they definitely deserve not to be graded down. They usually are, though, as I know from personal experience. It is amusing and disgusting at the same time.

*

A woman tells me that one reason women like the singer John Mayer is because his voice has something "dirty" about it. I suppose it is easy to imagine women masturbating while listening to him, fantasizing about sex with the person behind that dirty, rough voice. But what explains the appeal of such a voice? Why do women like to listen to it? Because its qualities exemplify one modality of masculine sexuality. Barry White's deep, sexy voice manifests another modality. Women want to be "*penetrated*" by such a voice and so by masculine sexuality; -- listening to these singers and others such as Bruce Springsteen and Elvis can be like simulated sex, dirty, rough, or smooth and gentle in the arms of a strong mellifluous voice like Josh Groban's. Of course the fundamental psychological fact of self-love is implicated in all this too: imaginatively or physically *joining* oneself with these singers and with a strong man more generally entails physical, emotional, and sexual self-confirmation, the proving and enactment of one's reality in the crucible of recognition by an other who is implicitly seen as stronger, realer, more dominating than oneself.¹ [Such ideas are arrived at through imaginative, 'empathic' contemplation of a woman's state of mind when listening to one of these singers. They aren't just arbitrary 'external' assertions.]

It is ironic that even though men are commonly thought to be obsessed with sex, it's closer to the truth to say that with women everything is connected to sex and sexuality. Their *being* is more sexual and sexually manipulable than men's. For men, sex is sort of an external thing, a drive to fuck as many women as possible and then get on with your day. For women it is more internal and seemingly (relatively) all-encompassing -- as during sex itself, for example. Men's sexual experience is almost entirely concentrated in the penis, an external organ; women's can be diffused through the whole body. The breasts, the neck, the legs, the butt, the feet (sucking on them, say), everything that can be grabbed and caressed and kissed. And a powerful female orgasm can apparently send ripples of ecstasy through the whole body, whereas a man's is like a contraction of the muscles in the pelvic area, a sort of long grunt of pleasure down there and then it's over. Women are sexually sensitive almost everywhere, from their feet to their scalp (massage), their fingertips to their neck. *Touch* is powerful for them, much more than for men. Precisely because it's more sexual for them. But their sexual sense generally has to be awoken from the outside, conjured under the touch of a man or the sound of his voice,² whereas men's "sexual sense," insofar as it exists at all, is more or less always present in the form of their underlying "external" *drive* to touch and penetrate the attractive women they see.

*

For people with spirit, a sublime experience is less sublime if it is shared. The sublimity is concentrated in the solitude. The more people, the less profound. (Implications??)

*

¹ It is only women, not men, who experience sex in this implicitly "self-subordinating" way. They almost necessarily do, in light of their relative passiveness, their *being penetrated, being held, being moved*, during sex. (Doubtless there are exceptions of half-masculinized women who want to be the active partner and half-feminized men who want to be the passive partner. But the rarity of these exceptions is significant. Anyway, remember I've always said there is a bit of the feminine in men and a bit of the masculine in women, to varying degrees depending on the person.)

² [Yes, I know lesbians exist too.]

In the Piazza of San Marco in Florence is a church in which lies the dried-out corpse of Saint Antonino from the fifteenth century, his hands folded on his chest in a well-lit glass tomb. The sight is macabre. Above and behind him and all over the church are models of Jesus's crucifixion, this man being tortured to death on a wooden cross with blood pouring from his hands and his pierced ribs. The church is cavernous and dark, with heavenly art and stained glass windows lulling the beholder into a state of awe intensified by the enforced silence, the whispering, the candles, the pews for praying on your knees with your head lowered and your hands clasped, and the "*mass-iveness*" of it all. And there are the rituals, the imbibing of wine (Christ's blood) and the wafer (Christ's flesh), and numerous such otherworldly, morbid rituals. And you realize that Catholicism is a religion of death. It is immersion in the past, preservation of the past and the dead, worship of the sphere of after-death, rejection of the worldly and the living. The five-hundred-year-old withered corpse of St. Antonino is a nice emblem of Catholicism. A religion so death-focused could not have triumphed in a dynamic civilization such as that before the late Roman Empire; and after a reemergence of dynamism, an epochal reformation was necessary. Dynamism, individuality, *life* had to be reintroduced into religion. And yet even Protestantism is in general a sort of compromise between life and death, this-worldly affirmation and negation. Some forms of Catholicism can even be more this-worldly than some kinds of Protestantism -- for example, liberation theology versus, perhaps, primitive Methodism. The forms that religion takes depend on the social context, but Catholicism has a definite tendency to oppress and *weigh down* the human spirit with death and its conceptual offshoots. The scent of decay, of a decaying antiquity, lingers about it.

It is ironic, then, that Catholicism would have inspired so much more great art (though not music) than Protestantism. Or perhaps not so ironic. An obsession with the transcendent, after all, has often characterized the artistic temperament, as has a peculiar morbidity. On the other side, the Church has always used art as a means to intoxicate and entrance the human spirit, to raise its vision from ordinary life to eternal life-in-death. And to direct it from the present to the past, which is also supposed to be the posthumous future.

One might defend Catholicism by arguing that it "affirms" one side of man, the "transcendent" side, the wonder-full side, the side that looks toward the universe and craves divinity and immortality, as well as the *communal* side, which goes together with the Catholic emphasis on tradition, ritual, memory, the past. In some sense, this may be true. Nonetheless, Catholicism remains, or tends to remain, a religion of anti-individuality, non-presence -- the non-present, the mythical past and post-deathly future -- death-in-life and life-in-death, which as such is opposed to a society immersed in a dynamic and forward-looking present.

*

The primal urge.-- I have replaced Schopenhauer's will-to-live, Nietzsche's and Adler's will-to-power, and Freud's will-to-pleasure with the will to self-confirmation, which encompasses them all. It is the organism's will to "objectively confirm" its "self-love" in the world, whether by surviving, by conquering, by experiencing pleasure, by overcoming its own perceived inadequacies, or whatever.

*

It is significant that children refer to themselves in the third person before they do so in the first person. It shows they do not yet have a clear or full conception of their own subjectivity, which means there is not a clear opposition in their mind between self and other. Only after years of conflict between self and other, i.e. confrontation between one's own perspective and others', does one deeply internalize the viewpoint of the other and so attain full self-awareness as a self distinct from all others in the world. Selfhood is attained through, and is synonymous with, mental conflict and contradiction. This conflict intensifies and gives new meaning to the urge for self-confirmation that is in some primitive form present

in all living things. (With regard to the vast majority, the concept of self-confirmation has very little meaning.)

*

The nation-state made possible corporate capitalism, but then the son killed the father.

*

Chomsky speaks.-- "Two years ago, a large majority of the U.S. opposed the threat of force against Iran. That is, they opposed the U.S. being a rogue, outlaw state which violates the UN Charter. The UN Charter, though nobody will mention it, bars the *threat* of force in international affairs, meaning everybody in the American political system is a criminal, because across the board it's 'all options have to be open.' Well, the population opposed that."

*

A soldier speaks on Schubert.-- Under a Youtube video of the Andante from Schubert's Piano Trio D. 898 is this comment (from a Scandinavian): "i suffer from post traumatic stress disorder and the only thing that calmes me is schuberts music, no joke it's... yes it's the best. it's my medication... my friends would die laughing seeing this comment but God bless you and may you rest in 'piece' you chuppy little austrian fella!" I can well imagine that this piece, this piece of divinity, would soothe someone with PTSD. One of the most soothing pieces in music caressing away a soldier's pain.

*

Listening, for example, to the 4th movement of Beethoven's 5th symphony, it occurs to you that what makes Beethoven Beethoven is the *naïveté* of his enthusiasm for life. The *childlike sincerity*, the *directness*, of his enthusiasm for life. It is this that speaks to billions of people. It is this that keeps the music perpetually fresh. Or, rather, the music's freshness is synonymous with its childlike sincerity; and Beethoven's whole art consists in the attempt never to let anything hackneyed or didactic or formulaic get in the way of the direct and spontaneous expression of emotion and thought. Most timeless art, in fact, has this "naïve" and "spontaneous" quality, but none more so than Beethoven's. How he managed to convey it through the manipulation of sounds is a mystery, because music itself is a mystery. But it is clear that even the music's "flaws," such as its occasional coarseness, vulgarity, and orchestral imbalances, contribute to its childlike vitality and hence its power.

*

The Redeemer.-- Listening to the Pastorale Symphony, I can't help loving Beethoven as the greatest benefactor mankind has ever known. The deaf man torturing himself to create pure happiness for the rest of us. (Can you imagine how much less *rich* life would be if that man hadn't lived?) I had just returned from a party and was feeling impure, stained by young women's childishness, but all I had to do was turn on this symphony in order to elevate myself. Shedding the *particularity*, the *personal preoccupations*, of femininity and of humanity in general; embracing the universality of genius.

*

June

Reading *Modern Man in Search of a Soul* (1933), by Carl Jung. Like so many early psychoanalysts, he has a rather naive scientific method. Assuming that all dreams are symbolic and then trying to discover what they symbolize. And yet he could be right. Some of his and Freud's analyses of particular dreams are convincing, though others are not. Personally, it is rare I have a dream that seems symbolic; more often they're totally nonsensical, even more nonsensical than the ones Jung and Freud discuss. And they're incredibly detailed; I remember almost nothing from them. They *could* be symbolic, but I have no reason to think they are (in any interesting sense). Last night, for example, I had a typically rich dream, much too rich to remember or summarize adequately, in which, among other things, Leonard Cohen went to Ground Zero sometime after 9/11, was moved by what he saw, and thereupon wrote a song about how consumerism was taking over America and depriving it of spiritual grandeur. (Maybe a reflection of my being impressed with Europe's culture.) The song was somehow thought to be very patriotic and so became wildly popular all over the country. A few years later, when the new Ground Zero site was almost completely constructed, the authorities had to decide what art to put in the four corners of the large plaza. They rejected their earlier plan of including a memorial of some sort to Britney Spears and decided instead to honor Leonard Cohen, because of his great song, in all four corners. I was very happy and thought that finally "great art" was being honored in America. -I suppose you could say this dream "symbolizes" my attitude to America, pop culture, etc., but that isn't symbolism in Jung's sense. Anyway, I'm willing to grant that all dreams are clues to the dreamer's unconscious -- and conscious -- life. And it is certainly a big mistake to write off psychoanalysis as "unfalsifiable" -- because it *is* falsifiable to some degree, indirectly. There are numerous ways to "falsify" or at least undermine a given hypothesis.

In the context of a discussion of the origins of psychoanalytic therapy and its relation to the confessional, Jung writes that

As soon as man was capable of conceiving the idea of sin, he had recourse to psychic concealment -- or, to put it in analytical language, repressions arose. Anything that is concealed is a secret. The maintenance of secrets acts like a psychic poison which alienates their possessor from the community. In small doses, this poison may actually be a priceless remedy, even as essential preliminary to the differentiation of the individual. This is so much the case that, even on a primitive level, man has felt an irresistible need to invent secrets; their possession saves him from dissolving in the unconsciousness of mere community life, and thus from a fatal psychic injury. As is well known, the many ancient mystery cults with their secret rituals served this instinct for differentiation. Even the Christian sacraments were looked upon as mysteries in the early Church, and, as in the case of baptism, were celebrated in private apartments and only referred to under a veil of allegory.

However beneficial a secret shared with several persons may be, a merely private secret has a destructive effect. It resembles a burden of guilt which cuts off the possessor from communion with his fellow-beings.

He proceeds to contrast the relative harmlessness of conscious secrets with the harmfulness of unconscious secrets (or repressions), which are concealed even from oneself. They split off from consciousness and lead an independent life in the unconscious as "complexes" with fantasy-lives and so on. It occurs to me that all this stuff about repressions -- and the confessional, therapy, etc. -- has an obvious relation to self-love. First of all, I should say that the self evidently has unconscious aspects, as Freud thought (in *The Ego and the Id*, as I recall). But I don't want to commit myself to his terminology or framework. For me, the self goes as far into the psyche as the sense of "self-possession" or "self-identity" does. (That formulation isn't necessarily question-begging, though it might seem to be.) That sense is explicit or nearly explicit on the level of consciousness and becomes more obscure as you go farther into the unconscious, until it vanishes

altogether when you get to the mind's innate cognitive architecture and suchlike. That stuff is not even in principle accessible to introspection or self-consciousness, and so is not even obscurely part of the self.¹

You can see that a sense of self exists even unconsciously in the fact that it exists in dreams (very obscurely). In dreams you can differentiate yourself from others, and you can watch things happening to yourself. So there is even a kind of *self-consciousness* in dreams -- precisely to the extent that there is a self or a sense of self.

Incidentally, in the past I have defined the self as "consciousness of consciousness," but I should have said "consciousness of (a particular) consciousness as its own, i.e. as itself."² The former doesn't capture the sense of self-possession or self-identity implicit in the self.

So anyway, "self-love" is not only a conscious but also an unconscious phenomenon.

(I might also remark tangentially that my past equation of self-love and the self itself, while somewhat figurative, is also literally true. For the self is basically consciousness's sense of self-identity, and to identify with something, or make it part of your identity, is to "love" it or value it. (Thus, for consciousness to identify with itself is, so to speak, for it to "love" itself, and vice versa.) So insofar as you lack self-love, you lack self-identity, and hence you lack a self (to that extent). Conversely, to the extent that you lack a self you obviously lack self-love.)

What vitiates self-love is, naturally, self-division or self-disidentification. That is the opposite of self-identity or self-love. Pure self-love, if it were possible or a meaningful notion at all, would be complete self-identification, which, in Jung's language, means no secrets from yourself, no repressions, no lack of self-awareness or self-identification, hence no existence of unconscious aspects of the self at all. Total self-integration in consciousness.

When you have secrets from others (as we all do) or you think you're superior to them or hate them or have any sort of division from them, you're also divided from yourself insofar as they ("affectively") instantiate the other in you and hence are to some degree a part of you.³ Division from your "significant other," with whom you identify strongly, is more painful, i.e. harmful to self-love (self-identification), than division from strangers, because it means greater division from your self (because your significant other instantiates the other in you -- and, conversely, is internalized in it -- to a greater degree than strangers do and are). In any case, division from "humanity" disturbs your self-love to the extent that, if for instance you have "guilty secrets," you might feel impelled to share them with someone. Maybe a priest, maybe a therapist. By unburdening yourself to him and implicitly securing his forgiveness, his understanding, his acceptance, his love, you are securing the "love" (acceptance) of the other in you, which formerly you imagined, in the form of "humanity," to be condemning you or devaluing you somehow. Hence the disturbance in your self-love. Therapy or the confessional has the power to restore your self-love. To say it differently, you can "confirm" (at least partially) your disrupted and disconfirmed self-love by seeking approval from the priest or the therapist.

Self-confirmation means self-identification, a lack of self-division. You achieve it by achieving love from others and the world, because others and the world are internalized in the other in you, which is what determines your attitude toward yourself (your self-love or self-rejection, self-repression, etc.). Complete self-confirmation, however, -- to repeat -- is impossible, indeed virtually meaningless.

¹ *Derivatively* it can be, as I implied in my senior thesis eight years ago. By scientifically studying the structure of your mind, etc., you can realize that all that stuff is a part of you and so "derivatively" -- "conceptually," as opposed to "immediately" -- assimilate it to your self.

² The body is included in the self to the extent that the consciousness of which consciousness is conscious is also of the body.

³ You care about the other in you, you value it and identify with it -- because it really isn't an "it" at all but rather suffuses your whole consciousness and is an essential aspect of your self(-awareness and -love). It is like a "structure" of human consciousness or self-consciousness. When you care about someone or people in general, you do so to the degree that they embody this aspect of yourself that you value. This kind of identification *has to be* the psychological meaning of caring for others, because to care about them is precisely to identify with them in some way. And for you to identify with them, they must (by definition) embody or realize some aspect of you.

....I should note, by the way, that the very notion of self-division, self-repression, self-disidentification, etc., is paradoxical, because....how are we to understand the self's separation from itself? There are then two (at least two) aspects of the self that apparently don't identify with each other. And yet in some sense they still presumably constitute one self, albeit a divided one. But how is a divided self possible? What does it mean? A self is that which identifies with itself. So how can a self not identify with itself? Maybe the solution to the paradox has to do with the fact that in many respects the self only *implicitly*, not explicitly, identifies with itself, i.e. that many aspects of the self are not explicitly or *fully self-consciously* identified by the self as part of itself. This is true of the self's unconscious aspects. In dreams, it is true, there may be some kind of obscure self-consciousness, and unconscious or repressed aspects of the self may be recognized as part of it, but the self-consciousness of dreams is not *full, explicit, conscious* self-consciousness.¹ The *fully realized* self is the conscious one, i.e. the part of the self that is aware of itself in consciousness. Its unconscious and repressed aspects are only implicitly included in it. What does "implicitly" really mean, though?

....Did Jung ever explain what it *means* to identify with another person? How it is *possible*? He doesn't seem to in this book. Probably most psychoanalysts haven't given enough attention to this problem. As you know, I've tried to give an answer in various sketches over the past few years, involving the "other" that is a part of self-consciousness. (The "internalized other," the "generalized other," the "abstract other," whatever.) There is also, of course, a biological explanation (to which science will probably never attain). And surely a non-phenomenological psychological explanation too.

By the way, "identifying" with someone in the relevant sense doesn't have to mean you think you're *similar* to him or her. That's a different sense of the word. What I and psychoanalysts mean (as when they say someone overly identifies with his parents) is that your relation to and valorization of a given person constitutes a relatively important part of your self. You partially transfer your self-love to him or her, thereby "identifying" with him or her.

Jung's book is quite good, at least so far. He sees the need for a plurality of approaches in psychotherapy, in light of the plurality of individual personalities and types of neurosis. Freud's fixation on pleasure, for example, is one-sided and has to be counterbalanced by Adler's emphasis on the "urge to power arising from a sense of inferiority" (especially in socially unsuccessful people). "[Adler's] interpretation is designed to show the patient that he 'arranges' his symptoms and exploits his neurosis to attain a fictitious importance; that even his transference and his other fixations serve his will to power, and thus represent a 'masculine protest' against a fancied subjection." But I think that to invoke a will to power is theoretically inelegant. Adler's ideas can be accounted for on the basis of the more meaningful hypothesis of a universal urge to "objectively confirm" one's implicit self-love, an urge that takes an indefinite number of forms. Broadly speaking, its forms fall under three categories: the urges to create, to love or value another and be loved or valued (through friendship, romance, family life, fame, having a pet, etc.), and to understand. Basically you want simply to act on and in the world and so prove or enact your reality and self-love. You want to *commit* yourself to the world, and you want the world to commit itself to you. The common modern perception of having an "empty" life comes from a deficiency of commitment from either one side or the other. I.e., you lack a sense of self-reality or "self-effectivity"; your implicit self-love is not being objectively confirmed [**or stimulated (through self-expression or recognition from others).**]² You feel separated and alienated from the world in that, for example, you don't care about anyone or you don't

¹ I know all this stuff sounds silly and paradoxical, but that has nothing to do with the supposed inadequacy of my ideas or my formulations. It is patently true that there is some sort of self-consciousness in dreams. But it is equally obvious that this self-consciousness is different from the self-consciousness with which we are ordinarily familiar. How do we express the difference between them? If you have a better idea than saying that our ordinary self-consciousness, as contrasted with the dreamlike version, is "full, explicit, and conscious," let me know.

² [Yes, self-expression or self-activity -- and being valued by others, too -- is not only about "confirming" self-love but also stimulating and intensifying it. [In fact, by being confirmed, surely it is also intensified. That's the whole point of self-confirmation, really.] In the past I've failed to make that point -- although it has been implicit, I think. Incidentally, I say "self-activity" rather than simply "activity" because not all activity counts as true self-expression. Just ask people who hate their jobs.]

have a purpose in life that can allow you to “act on/in the world” in such a way that your self-love is confirmed [**and stimulated**] (by being realized in your “effective” activities). Even if your acts are “effective,” for example if you’re a good receptionist or a good bureaucrat, if you don’t *care* about them or haven’t “committed” yourself to them -- which means to (implicitly) hang your sense of self-worth at least in part on them or their success -- their effectiveness won’t make you feel as though you have a fulfilled life.

It may seem odd or counterintuitive that people value challenges they have to overcome or tasks they have to accomplish and prefer not to live a merely “easy” life -- so much so that if their life is too luxurious and easy they might commit suicide in order to end their “meaningless” life -- but actually this is perfectly understandable. For you confirm yourself by committing yourself to things and people and acting in the light of your commitments. This is just to say that it is human nature to *act* more than merely to *consume* or to be materially comfortable or have a leisured life. Your “commitments” are where your self-love meets the world and proves itself [**and augments itself (at least in the moment of your self-activity), by making itself real, so to speak**]. Without commitments, without caring deeply about things and people, you cannot truly meet the world and mold it, change it, make it recognize your value.

....Jung remarks offhandedly that without complexes, viz. “emotionally toned contents [in the unconscious] having a certain amount of autonomy,” “psychic activity would come to a fatal standstill.” A strong statement, maybe too strong. To have complexes, he says, means that “something incompatible, unassimilated, and conflicting exists -- perhaps as an obstacle, but also as a stimulus to greater effort, and so, perhaps, as an opening to new possibilities of achievement. Complexes are therefore, in this sense, focal or nodal points of psychic life which we would not wish to do without.” What *are* they, though? First of all, they’re the cause and/or the effect of a conflict. He says that in English we refer to them as “skeletons in the closet.” They are “vulnerable points’ which we do not like to remember and still less to be reminded of by others, but which frequently come back to the mind unbidden and in the most unwelcome fashion. They always contain memories, wishes, fears, duties, needs, or views, with which we have never really come to terms, and for this reason they constantly interfere with our conscious life in a disturbing and usually a harmful way.” In short, a complex originates in a clash between a requirement of adaptation and the person’s “constitutional inability to meet the challenge.”

....“Self-love” is a complicated thing. Even in a depressed or “self-hating” person it necessarily exists unconsciously and is implicit in all his acts. But his depression implies a low intensity of self-love, a relative lack of the sense of self-reality or self-certainty or self-efficacy (a notion that can perhaps be defined as “self-love that has been enacted in self-expression or confirmed through recognition from others and thereby intensified, changed from ‘imaginary’ to ‘real’”). There are also, of course, different kinds and levels of self-love. For example, someone might be explicitly and obnoxiously “self-loving” or arrogant, but that might disguise a more fundamental deficiency in self-love, a deficiency in self-certainty (or the deep, implicit perception of self-efficacy that is synonymous with serene self-confidence).

Here’s something interesting, by the way: I missed my flight from Budapest to New York (whence to Chicago), so now I have to pay \$740 to change to another flight tomorrow. It was a silly mistake: I thought the flight was at 12:55 instead of 11:55, so I lost myself in reading and writing at the airport as I waited for the transfer plane. At 11:45 I realized what time it was, learned that the flight was leaving in ten minutes, ran to the gate, and wasn’t allowed on. I suspect my parents won’t be happy when I tell them, since they’ll have to help bail me out. Stupid, stupid mistake. Now I’m at a cheap hostel in Budapest.

In the aftermath of defeat I half-decided not to stay at any place tonight and instead wander the city or sleep on a bench. I thought I deserved it. It was my way to atone. The prospect even pleased me a little, for some reason. I *wanted* to do it. But how do you explain that? I had no idea why I wanted to experience a sleepless and uncomfortable night; all I knew was that “part of me” had that desire. Its causes were unconscious, like the causes of Marmeladov’s desire to be beaten by his wife. The starting-point of an explanation is that I obviously half-consciously expected such a night to make me feel better, to wash away my self-frustration. It would be my way of atoning. By so atoning I would restore things to normal, restore the equilibrium, compensate for and so effectively “erase” my past stupidity. “I made an incredibly stupid and expensive mistake; well, okay, I’ll spend tonight on the streets. That will satisfy me.” The point, I think,

is that by punishing myself I would be “acting out” (or “enacting”), so to speak, my self-love, my self-respect. By subjecting myself to a stern justice, or a *compensation*....well, but *how* does that realize my self-love? This is a difficult problem.

It reminds me of the fact that sometimes murderers who get away with their crime can't live with their having escaped punishment and finally turn themselves in. It is the Raskolnikov syndrome. (And maybe the Marmeladov syndrome too, come to think of it. He enjoyed being punished for his crime of being a pitiful alcoholic.) It isn't the murder itself they can't live with -- i.e., it isn't that they feel so horrible about having killed a person that they can no longer live with themselves. They want to be *punished*, not *dead*. If granted their wish for a punishment, it is quite possible they'll feel good about themselves again, indeed will be very happy, won't be bothered much anymore by their knowledge of having committed a murder. In my case too, it wasn't merely my *stupidity* that bothered me; it was the feeling that I had committed a *crime*. I really felt like a kind of petty moral criminal -- against my parents, I think, or rather against the “law” they have implanted in me that to disrespect money on such a scale is a crime. Even if they were dead or I did not expect them to lend me money or even to find out about what I'd done, I suspect I would have felt the same guilt. It was their *law*, not their actual selves, that weighed heavily on me. Or maybe you could say I was burdened by my internalization of their harsh perspective, which is equivalent to my unconscious or half-conscious desire that they, or my internalization of them, approve of me. I wanted to subject myself to their law, which meant I had to compensate for my transgression. Then I would have their implicit forgiveness; they, or my internalization of them, would be well-disposed toward me again, which would let me be well-disposed toward myself.

Normal people don't want to be wholly free; they want to be anchored in some kind of moral order, subject to a moral law that has punishments attached to its violation. In this way they can define themselves, can have standards by which to determine at any given time that they are worthy and self-defined beings. To be totally free, to live a morally unbounded life of whims and hedonism and unaccountable sinning, tends to be an intolerable psychic burden. That is to say, it tends to contradict the fundamental urge for active confirmation of one's value as a self. For one thing, it entails a denial of recognition of your value or self-love by authority-figures from your past or present whom you have internalized and whose judgment at least unconsciously matters to you. Consciously or unconsciously you know what their attitude is or would be towards you, and this tends to affect your mental health, either reinforcing/stimulating or undermining your self-certainty (self-harmony, etc.). --Actually, the case of the unhappy hedonist or “inveterate sinner” and that of the criminal who wants to be punished are psychologically different, although what I just said about authority-figures is true of both. So let's ignore the hedonist and focus on the criminal. Aside from the “authority-figures” thing, he is also troubled -- this is surely the crux of the matter, at least in many cases -- by always having to conceal from others a dreadful *secret* about himself. In such a case, Jung is literally right that the secret is “a burden of guilt which cuts off the possessor from communion with his fellow-beings.” The burden of guilt, to repeat, is not necessarily due to the crime itself; it is due to the criminal's having to *conceal* the crime. He can never feel wholly at home in the company of others (unless they know his secret) because he always has to be careful not to reveal himself. He cannot know true companionship, true loving confirmation of his self-love, until he gives himself up. Through punishment, moreover -- compensation -- he feels as though he will be submitting himself again to the common moral law, which will signify his reentry into society (even as, perhaps, he physically leaves it, going to prison or Siberia like Raskolnikov). He will be reentering the human community. Realigning himself with his authority-figures, his significant others, etc.

[All kinds of guilt are, I think, implicitly about self-love in some way or other, like most things (or everything?) in the psyche. But in someone with an empathic disposition, guilt can also be about genuine concern for others. What is “genuine” concern, though? Is there a line to be drawn between “egoistic” guilt and “altruistic” guilt? Where do you draw it? I think you could call Raskolnikov's guilt egoistic,¹ but “empathic” guilt surely exists too.]

¹ [After all, he seemed to lose his burden of guilt after he was exiled to Siberia and had the love of pure devoted Sonia. What he wanted all along was that people and society forgive him, so he could (thereby) forgive himself. -On the

The Marmeladov syndrome is different from the Raskolnikov syndrome in that it doesn't involve a *terrible secret*, but it is similar in that it entails self-contempt due to the violation of the common moral law, i.e. due to the person's implicit knowledge of condemnation from society and his significant others in the form (at least) of condemnation from the other in his consciousness, or himself. Marmeladov compensates for his crimes by letting his wife beat him, which implies (as he sees it) that he accepts moral norms after all and so is not the outcast he seemed to be. He shows he agrees with his implicit accusers about himself, thus securing the validation of at least *some* of his injured self-love. (He has partially split himself into a "higher" and a "lower" part. A (self-)condemning part and a condemned part.)

My own feeling of guilt in the airport was identical neither with one case nor the other, but it was a milder form of both.

As for Budapest: ten years ago I wrote that the people here were unfriendly and unhelpful, "Budapests." But this time I've experienced exceptional kindness and helpfulness. I guess I was just unlucky the last time. The city itself is as *magnifique* as I remember. Thank God much of it wasn't destroyed in the Second World War.

Assisi is as holy a town as its reputation holds it to be. A mini utopia. Spello too.

Jung's book gets worse and worse as you read on. Confusions piled on confusions, empty poeticizing, unargued declarations *ex cathedra* in every paragraph, naïve reflections on history and "modern man," infantile excursions into philosophy. Stupid bile against philosophical materialism. Nonetheless, a few stimulating and sensible remarks here and there. Such as his critique of Freud's obsession with sexuality (to the point that almost everything in the psyche becomes, for Freud, a manifestation of sexuality, which concept thus starts to lose its meaning) and his overemphasis on the sickly:

The sexuality which Freud describes is unmistakably that sexual obsession which shows itself whenever a patient has reached the point where he needs to be forced or tempted out of a wrong attitude or situation. It is an over-emphasized sexuality piled up behind a dam; and it shrinks at once to normal proportions as soon as the way to development is opened. It is being caught in the old resentments against parents and relations and in the boring emotional tangles of the family situation which most often brings about the damming-up of the energies of life. And it is this stoppage which shows itself unflinchingly in that kind of sexuality which is called "infantile." It is really not sexuality proper, but an unnatural discharge of tensions that belong to quite another province of life. This being so, what is the use of paddling about in this flooded country [as Freudian therapy does]? Surely, straight thinking will grant that it is more important to open up drainage canals. We should try to find, in a change of attitude or in new ways of life, that difference of [energy-]potential which the pent-up energy requires....

Jung's goal to "put sexuality in its proper place" by showing that it is only *one* of the "life-instincts" is right, I think. Are we to make every aspect of interpersonal relations a manifestation of sexuality?? Are we to reduce even artistic and philosophical creation, and religion, and maybe science itself, to sublimations of sexuality?? The human brain and mind are complicated things; surely everything in them, or everything that humans do, does not revolve around the single function of sexuality. In the sexually repressed and puritanized but also sexually over-analyzed Victorian and Edwardian ages, which in addition were characterized (amongst the middle and upper classes) by stultifying family relations, dictatorial and distant father-figures, severely patriarchal structures throughout society, and insufficient outlets for *play*, it isn't surprising that Freud would encounter an extraordinary number of sexual neuroses (especially among women) in his therapeutic practice. But the West's experiences of later years have exposed the cultural specificity of all that Oedipal stuff, that "hysterical" stuff, that blocked-sexual-energy-being-sublimated-

other hand, his compassion and pity for Lizaveta probably did entail an element of "altruism" in his guilt, genuine and profound regret for brutally killing this poor girl. Most guilt must comprise a mixture of egoistic and altruistic elements.]

and-causing-neuroses stuff. In reality, sexuality properly so-called is but one valence, so to speak, of other-directed energy, one mode of orientation to the other.

On the other hand, it seems likely that sexuality “blends into” other ways of relating to others. And Freud may have been right that all humans are to some degree bisexual, or at least have the potential to be -- that is, to enjoy homosexual play or sex -- given certain circumstances (such as being a sailor forced to live among men for years on end). Or, well, no. Maybe with regard to those unusual circumstances one could reverse the Freudian dictum and say that the psyche’s platonic ways of relating to others can become “sublimated” into sexual ways, so that the supposed “bisexuality” is (in most people) not true bisexuality but just a “pathological” adaptation to those circumstances. I, for one, think it would be well-nigh impossible for me to get an erection at the thought of having sex with a man, no matter what circumstances I was in. Surely that is in large part a genetic thing, and thus I am not even latently bisexual in the real sense.

Are the infant and young child suffused with “sexuality” of some sort, given the probable existence of oral, anal, and genital stages? Again, probably not to the extent that Freud thought. I’m not even sure it’s proper to call the oral and anal stages “sexual” at all. The child is curious about his world and his body and enjoys exploring them. Is that sexual?? Insofar as he derives physical pleasure from his oral and anal activity, *maybe* it can be called sexual in an extended sense. But in order for this not to become a mere quibble over terminology, the issue has to be about the relation between the child’s activity and his or her still-latent sexual drive (or instinct).

Jung’s un-mechanistic, “spiritual” way of interpreting the psyche is in some respects better than Freud’s, especially in the therapeutic situation. The self, hence the psyche, needs meaning, not mere gratification. However, Jung is *too* idealistic, with all his claptrap about the spirit, God, and suchlike.

[...] It upsets me that Aniela is sad. –But why does that upset me? The obvious “explanation” is simply that I care about her, but that doesn’t explain anything. What exactly is going on in my mind? Does it have to do with “self-love” on my part? I don’t see how. Anyway, all this emphasis on self-love bothers me. I don’t like emphasizing humans’ egoism; I want to believe in their altruism. What about empathy, after all? What about sympathy, compassion, pity, etc.? Maybe I already addressed this issue earlier by saying that people to some extent “internalize,” at least momentarily, everyone they meet, or even people they haven’t met, thus subtly identifying with them. Compassion and empathy are about identifying with people, broadening one’s self-love to include them. But then doesn’t the concept of self-love lose its meaning? Besides, you can’t erase the fact that by caring about another it is the *other* you care about, not yourself.

Aaaaah, I’m tired after my long flight and sick of psychological analysis. I care about Aniela; that’s enough. I wish I could make her happy.

....You can say whatever you want about self-love, self-confirmation, the need for self-validation, for assimilation of the other and externalization of the self, all that crap. It remains true that the self is not all that matters, that humans can care deeply for each other, that another’s happiness can be more important to you than your own (however you want to explain that psychologically), and that the most important part of life is love in all its permutations. Indeed, it is precisely by caring about the other more than yourself and devoting yourself to people that you can best validate your self-love, can give your life meaning and so confirm your worth. This is why such devotion is so satisfying. Self-realization through self-denial, so to speak. That is, through community (or a lack of fixation on yourself). **[Remember, the abstract (or internalized, or “implicit”) other is effectively seen as having absolute value, as shown by the fact that its recognition¹ is the standard by which the self judges its own value. The self wants to fuse with the other, and the only way to achieve or approximate such fusion is through recognition, whether it be (implicitly) through self-expression or (explicitly) through love of another person or emotional identification with a community. But the latter two methods are particularly effective, because they entail both self-expression and identification with a *concrete* other or others, hence a particularly**

¹ Or, recognition by *people* as mediated by the abstract other.

emotional fusion with the abstract other (as embodied in the concrete others one loves or identifies with¹). This explains the ecstasy of religious conversion -- profound identification with a whole community, as well as with something like the abstract other itself, in the form of "God."

[If all this talk about the abstract other is confusing, just think about it in terms of the "world." You seek the confirmation of your self-love, your (implicit) self-conception, in the world, by getting recognition (in various forms) from the world. The world is basically the "concrete" side of the abstract other, or rather the latter is the internalized side of the world and its responses to you.]

....One last thing. Maybe I've been wrong to use the word "abstract" when discussing the other in consciousness, because the other is implicitly associated with the privileging of certain values and norms, and with significant others you have internalized (by valuing them, identifying with them, taking their perspectives -- see Mead), and with moral tendencies in your society. All these are revealed in your behavior rather than directly in your consciousness -- although if you introspect you might be able to access them. You pursue recognition by others, which means by the "general" other in your consciousness, which means by your self, by acting to uphold and honor these values, norms, internalized significant others, etc. G. H. Mead might say that your "I" is constantly acting in the light of your "me." When you meet new people who impress you, too, your being impressed is largely a result of their embodying the values you have internalized throughout your life (many of which, however, seem to be naturally ingrained (i.e. naturally valorized) in humans, for example qualities of leadership, intelligence, strength, and kindness or compassion; only around the "margins," so to speak, are the forms that these values take socially determined). To repeat, the general other is just a part of your consciousness; but it is somehow "associated with" your half-conscious or unconscious standards of judging people's worth. The more highly you think of them, the more completely they instantiate the other in your mind (and vice versa), and potentially the more important they'll be to you (e.g. as people whose recognition you want).

Email:

Professor Chomsky,

A few thoughts on your rejection of the mind-body problem. As I understand it, your position is that no clear distinction between the physical and the mental can be made because we have no coherent idea of the physical; therefore, the "problem" collapses, given our inability to understand what it is about or what it means. I would respond, first, that people do seem to find the relationship between the so-called mental and the so-called physical intuitively puzzling, and at the very least we have to try to understand what is the source of this puzzlement. And here, Descartes is surely on to something when he writes that the physical is extended and the mental not. No doubt modern science has undermined his distinction by concluding that "beyond our experience," on the level of quantum mechanics and so forth, the physical is in fact not extended; but within our experience, at least, it is, while the mental is not. (One cannot "divide" a sensation or a thought into parts as one can a banana or a piece of paper.) Insofar as we have experiential access to things that are called physical, such as tables, and things that are called mental, such as private sensations, we do seem to be struck by how different they are from each other. Another way of formulating the difference might be to say that the physical things of our experience

¹ A person can exemplify one's half-conscious notion of a "valuable" other -- which notion is intimately associated with the ("valuable") abstract other that is an implicit element in one's consciousness -- to a greater or lesser extent. The more closely he or she exemplifies it, the more satisfying will be one's recognition by him or her (or them). Incidentally, being recognized by (or identifying with) a community can be an especially powerful experience because the communal nature of the other in this case is sort of a realization of the abstract nature of the other in consciousness. A community is more like "humanity" or "everyone" or "the world" than a single person is -- and the notions of "humanity" etc. are projections of the abstract other whose recognition, as I have said, is the self's implicit standard of value.

are publicly accessible, while mental things cannot be directly or immediately experienced except by a single self. They are "private." The question then arises how to relate these two kinds of things that we experience.

Now, I see no reason to think that "matter" cannot be conscious -- except that *how* it is conscious is a mystery to me. I find it mysterious that electrical and chemical impulses traveling along neural networks can give rise to consciousness -- precisely because it seems to me that there are two different kinds of things involved, namely "non-extended" consciousness and "extended" configurations of matter. What the "ultimate" nature of matter is, whether it is extended or non-extended or outside our comprehension or whatever, is, I think, a separate question; what puzzles me is that I see no way to relate the matter I experience, which is extended, to consciousness, which, as Descartes said, is surely not extended (at least not in the same way). In other words, maybe it is not necessary for us to understand the true or "ultimate" nature of matter in order to have some grasp of the mind-body problem -- because the latter has to do only with the "ordinary" matter we experience, which, it seems to me, we *can* coherently characterize, in something like the ways Descartes did.

And yes, the problem remains of how to relate the matter of our experience to the very mysterious stuff that physics postulates, but this question is separate from the mind-body problem.

Thanks for your time.

Can't really respond, because you've mistaken my argument and conclusion.

It has nothing at all to do with quantum theory. Rather, in brief, Newton -- greatly to his dismay -- eliminated the only coherent notion of the "material" (physical, body, etc.). Nothing has replaced it since, apart from our best theory of the world, whatever it is, a constantly changing conception. In the 18th century it was widely understood that Newton's discoveries undermined the body-mind problem, and that it would be necessary to pursue what's known in the literature as "Locke's suggestion" -- that there is no real alternative to trying to understand how organized matter can think, just as it can attract, repel, etc., in ways so mysterious that Newton regarded the idea as "an absurdity." That continues at least until Darwin, and for those familiar with the history of science/philosophy, to the present.

Um, yeah. Not exactly an adequate response. I wrote back,

I know about Newton's elimination of the Cartesian conception. I was just using quantum mechanics as an example of the modern 'reinforcement' of the elimination. But my point was that the mind-body problem can be understood in a way that bypasses all these concerns about the 'true' nature of matter and focuses on the nature of the matter of our experience, which, I suggested, can be understood sufficiently for us to make some sense of the mind-body problem. I think it's wrong to just ignore the common intuition that there is such a problem. Doesn't it seem deeply mysterious to you that consciousness can arise from neural firings and so forth? I acknowledge that's the way it has to be, but it still strikes me as mysterious. --But I guess we're talking past each other. Sorry.

I guess we are talking past each other. In writing about this matter for half a century I've repeatedly pointed out that Gilbert Ryle was wrong in concluding that the mind was exorcised: it was the body. Descartes' conception of the mind, such as it was, escaped unaffected.

Sure, it's mysterious that consciousness can arise from neural firings. But as Newton, Locke, Hume, and many other leading figures of intellectual history recognized, it's also mysterious that attraction and repulsion, etc., can be properties of matter. Since Newton, we live in a world of mysteries. I'll attach one of many articles of mine about it, this one in the J. of Philosophy.

[After writing several of the paragraphs in my journal below -- hence the repetition (as you'll see soon enough) -- I replied with this:

Thanks for the paper. I actually read it a couple years ago, I think, and found it very valuable. I'll re-read it.

Regarding the admittedly impenetrable mysteries of attraction, repulsion, etc., I would just say that I think the "mind-body problem" is as much of a genuine problem as they are. My argument against you was based on what was perhaps the misunderstanding that you deny the substantive nature of the mind-body problem (on the grounds that we have no coherent concept of matter). **[His response: "If there's no coherent notion of matter (body), there's no coherent formulation of the mind-body problem, and we're left with 'Locke's suggestion.' For the same reasons there's no attraction/repulsion-matter problem."**¹]

Incidentally, I can't help thinking that the category of the mental, while certainly a "subcategory" of the "physical," is not strictly comparable to such categories as the optical, the electromagnetic, the organic, etc. (as you imply in another paper), given that the peculiarity of the mental surely consists in its being *matter's experience of itself*, and hence its introducing an element of reflexivity or "self-reference" absent from non-mental types of the physical. In being matter's experience of itself, mind seems quite "special" to me, unlike other categories of matter.

But I don't want to keep taking up your time. Thanks again for the paper.]

Reading parts of *Chomsky and His Critics* (2003), a collection of essays and responses to them by Chomsky. Philosophy and linguistics, not politics.

Chomsky: "I see no reason to question the general conclusion reached long ago that thought is 'a little agitation of the brain' (Hume), or a 'secretion of the brain' that should be considered no 'more wonderful than gravity, a property of matter' (Darwin)." Right. Gravity is mysterious, and thought is mysterious. That is to say, matter itself is just as mysterious as the relationship between "mind" and "matter." But what I was saying above is that questions about the nature of matter and questions about the relationship between consciousness and the brain, while perhaps equally mysterious, are really two different sets of questions that both have to be answered (but probably never will be adequately). The fact that the nature of matter is mysterious doesn't entail that the mind-body problem is not a problem.

According to Chomsky, the category of the mental is not fundamentally different from any other physical category in nature, such as the electromagnetic, the optical, or the organic. These are all just

¹ Okay, fine, but there's a mind-body *mystery*. He himself has distinguished in the past between "problems" and "mysteries."

distinctions among various aspects of the world. But it seems to me that the “mental” has a special status. Simply stated, it is matter’s experience of itself. It therefore introduces an element of reflexivity or self-reference. This is what gives it its “private” character, which is unlike the electromagnetic or the organic as such. So Chomsky is right that mind is not a different substance than matter, but he is wrong that it is strictly comparable to such categories as the mechanical and the optical.

As I said, or implied, years ago when formulating my version of emergentism, the mental is physical but in a different way than the non-mental is. The latter is just unproblematically physical, and it mostly includes extended stuff like tables, neurons, molecules, atoms, protons, but also whatever non-extended entities and waves and forces and so on have been postulated by physicists. The mental, in being matter’s self-experience and thus uniquely reflexive and emergent (from extended physical stuff), is not extended and not spatiotemporal in quite the way of ordinary matter. (A sensation does not have an exact spatial location in the way that a neuron does.) So it is physical, but it is also oddly non-physical, or at least different from ordinary physical stuff. Hence the centuries of confusion.

Galen Strawson, a materialist, is right to reject the usual terminology of “mental vs. physical,” because, after all, the mental *is* physical (albeit in a peculiar sense, I think), like everything that exists. He substitutes for it “mental vs. non-mental,” which are two broad categories of the physical.

In a sense, I don’t understand what all the difficulty is with the mind-body problem, or why all these philosophical morons have to argue about it endlessly. Legions of them; they just don’t have a clue. Strawson is better than most, but even he isn’t perfect. He argues that consciousness is a form of matter, part of the physical being of the brain. Auditory experience, etc., is a *form of matter*. But that’s wrong, and in any case it leaves you with all the old questions and perplexities. Neurons are a form of matter; atoms are a form of matter; consciousness is a form of the *activity* of matter, the “emergent” activity.¹ That formulation itself settles many of the doubts, since our perplexities arise from supposed differences between *physical stuff* and consciousness, not between the *activity* of physical stuff and consciousness. As I said years ago when discussing Kripke’s *Naming and Necessity*, we have no intuitions about the nature of emergent electrochemical activity in the brain, as we do about the nature of the brain itself (e.g., its being divisible into parts, having a precise spatiotemporal location, etc.). It is our understanding of the *brain* that seems to contradict our understanding of consciousness; our non-understanding of emergent electrochemical processes cannot contradict our understanding of consciousness in the same way, precisely because we don’t understand electrochemical emergence. It’s true it is still perplexing to think that consciousness can arise from electrochemical activity, but if you stress the word *activity* you’ll see that at least now we’ve done away with the problems about physical stuff being divisible into parts (unlike consciousness) and having a definite spatial location (unlike consciousness), because we *don’t* intuitively think that any kind of “activity” is divisible into parts or has a spatial location in the way that physical stuff does.

As Bergson said, philosophical solutions are always simple in their essence.

Strawson goes on to argue that everything we know about the ultimate nature of matter is perfectly compatible with consciousness. He criticizes certain philosophers for finding it mysterious that “technicolor phenomenology can arise from soggy grey matter,” because physics has taught us that “the volume of spacetime occupied by a brain” is “not a sludgy mass but an astonishingly (to us) insubstantial-seeming play of energy, an ethereally radiant vibrancy” of “all the sweeping sheets and scudding clouds and trains of intraneuronal and interneuronal electrochemical activity which physics (in conjunction with neurophysiology) apprehends as a further level of extraordinarily complex intensities of movement and...organization.” We shouldn’t find it particularly mysterious, therefore, that consciousness can be physical, if *this* is what the physical is. I agree with him. These reflections do go a long way towards dissolving the intuitive (and conceptual) puzzles. But, first of all, I think the puzzles can be largely dissolved simply by saying, as I did above, that consciousness is not matter itself but a kind of interaction between elements of matter, an interaction between, you could even say, spatially extended things like neurons and

¹ [Well, neurons and atoms are that as well, but that’s irrelevant. The point is that they are also forms of matter itself, unlike consciousness.]

molecules and electrons and whatnot. But secondly, it seems to me -- and this is partly what I was arguing in the emails with Chomsky -- that whatever the intuitive and conceptual compatibility between consciousness and the “ultimate” nature of matter, what we naturally want to reconcile most of all is consciousness and the relatively “ordinary,” non-subatomic matter of our experience and of “ordinary” science like biology (with its cells, molecules, and the like). Besides, matter on the deepest quantum-mechanical level interacts with itself to create larger, spatially located and extended structures such as molecules and cells. These things *exist*. They are there, just as on a “different level” there is also the ethereally radiant vibrancy of energy and so forth. So, since both of these kinds of things exist -- the relatively macroscopic stuff of cellular biology and the more microscopic stuff of quantum mechanics -- both have to be reconciled with the existence of consciousness. We shouldn’t just *ignore*, so to speak, the existence of cells and “soggy grey matter,” as Strawson effectively does above. That stuff exists too, and so we have to conceptually reconcile it with consciousness. As I’ve done.

Moreover, consciousness is a macro-level phenomenon (which corresponds in its “macro-ness” with the brain). So it is a different sort of thing than the infinitesimally small fields of force and energy postulated by modern physics. Which means that the apparent, somewhat metaphorical similarity between the latter and consciousness doesn’t have much significance. We shouldn’t think, “Hey, we’ve learned from physics that the ultimate nature of matter is after all not so totally different from consciousness!” and try to reconcile matter and consciousness in that way. First of all, it strikes me that even this quantum-mechanical stuff is very different from consciousness, however “spiritual” or “ethereal” our metaphorical pictures of it are. But even aside from that, consciousness and this stuff are on such vastly different “levels” of reality, the one so inconceivably microscopic and the other so enormously macroscopic, that I don’t really see how quantum mechanics can bear on the mind-body problem.

In general, I don’t think the mind-body problem is the sort of thing that science can have much bearing on. It’s a conceptual and intuitive thing, not something we can make empirical discoveries about. It revolves around the profoundly mysterious division in our experience between public and private (or “outside” and “inside”), and between extended and non-extended. These divisions cannot be “discovered” or “theorized” out of existence; they are conditions of our experience. Even if it turns out that matter is essentially extended or has some other property inconsistent with consciousness, that doesn’t matter because the point is that consciousness is *emergent* from *interactions between* components of matter. That consideration is enough to “reconcile” it with matter, at least insofar as no gross logical contradiction remains but only intuitive wonder that consciousness could emerge from physical stuff.

Emailed Chomsky again (with the heading “One final thought”):

(I’ve been reading *Chomsky and His Critics*.) Galen Strawson argues that consciousness is “a form of matter,” and he agrees with you that we know nothing about matter that should make us think it is incompatible with consciousness.¹ That idea strikes me as compelling in some respects, but also, in a sense, unnecessary. For even if matter did have properties that seemed incompatible with consciousness, one could still argue that consciousness was not (a form of) *matter itself* but rather “emergent” from *interactions between* components of matter. And it seems to me, in fact, that this is what consciousness is. It is therefore “physical,” so to speak, but it is not, strictly speaking, “a form of matter,” in the sense that, say, neurons and molecules are a form of matter (extended, spatially located, etc.).

¹ [This is all a little ambiguous, because it’s possible for matter to be “incompatible” with consciousness in two ways. First, consciousness might be such that it can’t be a *form of matter* -- and I think that’s true. It isn’t a form of matter. Consciousness and matter, at least the matter with which we’re familiar, are two very different things. But matter could also be such that in its activity it couldn’t *produce* consciousness. And there’s really no reason to think that’s true. To be sure, we can’t *conceive* how matter would produce consciousness, but nature is full of conceptual mysteries. The point is that *this* mystery is at least not an example of a “gross logical contradiction,” such as that consciousness (unextended, spatially un-located, etc.) *is* matter (extended, spatially located, etc.).]

What I'm saying, in other words, is that whatever matter turns out to be has little bearing on the mind-body problem, because one can sidestep the supposed necessity of conceptually reconciling matter with consciousness just by saying that consciousness is an emergent phenomenon of *interactions between* components of matter (such as neurons and neurotransmitters). [In fact, that's the only thing it *could* be, on any naturalistic theory at all!]

[....]

Repetitive because I wanted to make sure he understood what I was saying. No answer, unfortunately.

Instead of sensible views like mine, what you get in the philosophical literature are extraordinary denials of the reality of consciousness (as a private, qualitative thing) or senseless assertions that it just *is* a form of matter, or arguments like Thomas Nagel's (in "Conceiving the Impossible and the Mind-Body Problem") that "our inability to come up with an intelligible conception of the relation between mind and body is a sign of the inadequacy of our present concepts," in which "some development is needed." Yeah, right. Through the "development of concepts" we'll someday be able to bridge the gap between "*outside*" and "*inside* [consciousness]," *public* and *private*, *non-mental* (what is usually called "physical") and *mental*. "We do not at present possess the conceptual equipment to understand how subjective and physical features could both be essential aspects of a single entity or process." Good luck in your search for that conceptual equipment. There is simply no way around the conceptual chasm between mental and non-mental. You can't ascribe to mental states non-mental predicates such as color, size, and physical structure, nor can you ascribe to non-mental things mental predicates such as phenomenal experience and intentionality. You can't bridge the unbridgeable [which means you can't explain how they could possibly interact, how the mental could arise from the non-mental¹]. The best you can say is that certain physical processes in the nervous system can be considered from two perspectives, the "serial" or "atomistic" -- a series of electrochemical events -- and the "holistic" or "emergent," which is the mental state. After that, it's all a damn mystery.

Reading *Hard Work: Remaking the American Labor Movement* (2004), by Rick Fantasia and Kim Voss.

Now reading *NAFTA and the Politics of Labor Transnationalism* (2011), by Tamara Kay. It's interesting that although many people predicted an intensification of laborite racism, nationalism, and conflict between Mexican and American workers as a result of NAFTA, in many respects the opposite has happened. Since the early 1990s, the U.S. labor movement has, especially at the national level, done much to shed its age-old nationalist and anti-immigrant attitudes, joining hands with unions in Latin America and elsewhere, even taking "illegal" immigrants in the U.S. under its wing. For instance, it has been in the forefront of the fight against draconian immigration laws in Arizona. No longer is the AFL-CIO exclusionary; it is now among the most inclusionary forces in politics. What explains the change? To a great extent NAFTA, which necessitated the creation of coordinating and regulating institutions across North America. "The NAFTA story is about how political-institutional fields serve as new transnational political opportunity structures for emergent transnational social movements. Faced with a trade agreement that could potentially undermine labor rights and standards in North America, labor unions entered these new political-institutional arenas to mobilize. Through their interactions, they began to develop not only a collective strategy and agenda for changing the rules of regional economic integration but also a sense of their collective interests as North American workers." Lovely academic prose, but you don't read scholarship for its literary beauty.

Apart from NAFTA, however, don't forget that SEIU's and other unions' relatively recent organization of Hispanics in cities like Los Angeles and Las Vegas, as well as multiculturalism and the huge influx of Hispanic immigrants in the seventies, eighties, and nineties, have helped push the American

¹ [To clarify: science can demonstrate that phenomenal experiences, for example, arise from certain neural events, but it can't conceptually explain how that's possible.]

labor movement towards a more inclusive and internationalist stance. The end of the Cold War, too, has allowed union leaders to be more progressive without fearing demonization as Communists.

Sent an email to a leftist friend who had forwarded me an article he liked that criticized Chomsky's anti-Leninism and so on. It was one of those stupid fringe-left articles that are little more than idiotic propaganda.

I don't agree with this article, which is simpleminded and inaccurate in places. For example, I haven't heard any praise from Chomsky for Obama, only criticism. (And the article doesn't cite any examples.) In 2004 he urged only that people in *swing* states vote for Kerry, because he understood that it would be concretely better for many of the oppressed around the world not to have Bush in power. Small differences in ideology and practices at the top can make big differences for those at the bottom. (I find it unlikely, for example, that the Iraq war would have happened had Gore been elected, since Gore is not as closely tied to the energy industry as Bush was.) So, because Chomsky cares about real people and not just an ideology, he advocated that, while in non-swing states people should vote for Nader or whomever, in swing states they should focus on getting Bush out of office -- and a vote for Nader would effectively mean a vote for Bush. (It's undeniable that the world would have been a better place if all those votes in Florida that went to Nader had gone to Gore and Gore had been elected. What matters is making the world concretely a better place, not furthering some pie-in-the-sky Leninism or other ideology.)

Sure, it would be great if we had a revolutionary party. But until an immense amount of organizational footwork has been done, there is little point in an electoral strategy -- getting a few hundred votes here and there.

As for Leninism, I did some research on that years ago when writing a paper on the Russian revolution. Turns out Chomsky is basically right, at least from what I discovered. As early as the very end of 1917 and throughout 1918, before the civil war had begun in earnest and the Party could use that as an excuse, Lenin and his comrades were already destroying experiments in workers' control over factories, and extensive repression had begun. Not on the scale of Stalinism, but in the suppression of democracy and dissent the seeds of Stalinism had already been sown. The best scholarship establishes this. It's revealing that the article cites no evidence whatsoever for its claims.

I do wish that Chomsky would focus more on positive strategies than he does, but that's his choice. He thinks it is not his place to give advice, only to dredge up information to which people would otherwise have little access. He has, however, repeatedly advocated that the left organize workers to take over their factories, more generally that it "educate and organize" the discontented -- but he sees that as just common sense, to which there is little for him to add. People just have to make connections with each other, fundraise, spread their message to others....the way it has always been done. There is no point in talking about a "revolutionary party" without talking about how to get there. But in fact there *is* no magical way to get there -- only the old way of connecting with others, fundraising, etc.

Of course Chomsky doesn't oppose a "revolutionary party." He simply opposes Lenin's methods and ideology, which, this article notwithstanding, were elitist and authoritarian. That was understood in Lenin's own day by Rosa Luxemburg and others on the Marxist left. (Even before the revolution, Lenin was seen by many as on the far right of Marxism.) His personality itself was very authoritarian, so it isn't surprising that his methods and ideology would be so as well.

Anyway, that's how I see the matter. Thanks for the article!

....Sometimes it's hard for "pessimism of the intellect" not to preclude "optimism of the will." *Al Jazeera* had an article today on climate change, which made it clear that humankind is on the precipice. A lover of life has to be in complete despair. How can you really care about anything when *it is certain* that twenty years from now the planet will be in chaos, and that things will keep getting worse until the end of the century and beyond? No scientist has any idea when the climate will finally stabilize. In the meantime, everything is in flux. Higher life might not even survive. According to one scientist, "The key issue is the large populations of plants and animals that make the planet inhabitable. We need oxygen to breathe and water to drink. A three-billion-year evolution of plants and animals has made the planet habitable, and we are systematically destroying this biodiversity by plowing, cutting, and burning areas." Human overpopulation makes it all much worse, of course. And carbon emissions continue to increase: "Unpublished estimates from the International Energy Agency (IEA) recently revealed that greenhouse gas emissions increased by a record amount last year to the highest carbon output in history, despite the most serious economic recession in 80 years."

Bought a bike -- I like biking -- so that'll be my main mode of transport until at least the end of the summer.

Watching videos on YouTube of Leonard Bernstein's Norton Lectures in 1973. Excursions into music theory, history, and appreciation. He makes a lot of good points in the first lecture -- for example, that the reason for *twelve* notes in the chromatic scale is that the circle of fifths, which arises out of the harmonic series (overtones -- you play C, there's a G overtone, etc.), gives you twelve tones. (C, F, B-flat, E-flat, A-flat, D-flat, G-flat, B, E, A, D, G.) [Um, you wrote that wrong!] It's fascinating that both the diachronic and the chromatic -- and of course the pentatonic -- scales have their source in the nature of the harmonic series. Bernstein is right that, just as humans have a Universal Grammar, so they have something like a Universal Musical Grammar, so to speak, which can be expressed in different "languages" (different types of music, types of scales, modes, harmonies). Obviously the parallel with language isn't perfect, but it's suggestive.

In the succeeding lectures, Bernstein takes the analogy with language too far. Goes into Chomskyan linguistics, tries to apply it to music, and things get a little silly. And it goes on with his incredibly extensive application of literary devices -- metaphor, alliteration, anaphora, repetition, etc. -- to music. Everywhere he sees "transformations," as in deletions, augmentations, inversions, and so on -- and those certainly exist, indeed are of the essence of good music, but to call them "Chomskyan" transformations is a stretch. He's right, though, to place *repetition* at the foundation of music.

He gives a fascinating and probably true explanation of why minor modes sound sad or disturbing. You know that when you play the tonic, implicit in the note are its overtones -- the fifth, the major third, etc. The *minor* third is also an overtone, but a distant one: the eighteenth. So when you explicitly play the minor third, thus changing the mode from major to minor, you're introducing an "interference" (of frequencies), or a sort of nearly imperceptible dissonance, since the major third, being one of the first overtones, is strongly (implicitly) present (in the tonic) as well. You're playing the major and minor thirds at the same time, as it were. The human brain hears this interference as expressing an unsettled, unsettling mood. Major modes sound "happy" because there is no interference of frequencies; there is relative harmony. The implicit first few overtones are also being *explicitly* played, pleasantly "reinforcing" the already present. (That last part is me, not Bernstein.)

Bernstein also makes much of the "delights and dangers of ambiguity." He sees *ambiguity* as key to *expressivity*. Syntactic, semantic, and phonological ambiguity. Reads from "The Leaden Echo" by Gerard Manley Hopkins, a poem with sublime ambiguities that delights in gorgeous sounds for their own sake. E.g.: "How to keep -- is there any any, is there none such, nowhere known some, bow or / brooch or braid or brace, lace, latch or catch or key to keep / Back beauty, keep it, beauty, beauty, beauty....from vanishing away?" Etc. Syntactically and *somewhat* semantically ambiguous. Hence extremely expressive (although that isn't the only reason). Music, too, he thinks can be "syntactically," "semantically," and

“phonologically” ambiguous -- and, to an extent, the more it is, the more expressive it is. Think of Chopin’s ambiguous and wonderfully expressive chromaticism, his playing around with tonality so that sometimes you don’t know what key you’re in, you’re “suspended.” Or Schumann’s rhythmic ambiguities, his syncopations and the like. Or the ambiguities of certain transitions in Beethoven, such as the transition between the third and fourth movements in the fifth symphony and that between the third and fourth movements in the Hammerklavier sonata. All intensely expressive. And the opening of Wagner’s *Tristan und Isolde*, even more ambiguous¹ and hence expressive. So ambiguous in its chromaticism as to stretch tonality to its limits -- thus making itself the “crisis work of the nineteenth century,” pointing directly to the musical crisis of the early twentieth.

After his performance of the beginning and end of *Tristan*, Bernstein eloquently sums up the history: “And so music can never be the same again. The gates of chromaticism have been flung open, those golden gates of the golden age, which were the outer limits of ambiguity, standing firm in diatonic majesty. But now that they’re open, now that Berlioz and Chopin and Schumann and Wagner have pushed them open, we’re in new tonal fields that are apparently limitless. We’re bounding and leaping from one ambiguity to the other -- from Berlioz to Wagner to Bruckner and Mahler to Debussy and Scriabin and Stravinsky. It’s a dizzying adventure, this romantic romp, shedding one inhibition after another, indulging in newer and ever more illicit ambiguities, piling them on, stringing them out, daring them to take over for nearly a whole century. But how ambiguous can you get before the clarity of musical meaning is lost altogether? How far can music romp through these new chromatic fields without finding itself in uncharted terrain, in a wild forest of sharps and flats? Are there no further gates of containment? Perhaps not ‘golden’ ones, perhaps only dry stone walls or rude fences? Well of course there are, or rather *were*, until they began to crumble under the attack of the new century. These tonal fences, these walls of formality, somehow managed to contain the rampage of chromaticism even through the crises of *Tristan und Isolde* and of *Pelléas et Mélisande* and of *The Rite of Spring*. But ultimately a supreme crisis did arrive, a crisis that remains unresolved to this day and is over half a century old....” He leaves us guessing at this point, dallying instead in the dreamlike chromaticism of Debussy. Thoughtful analysis of *Prelude to the Afternoon of a Faun*.

He’s right about how *ambiguous* art became in the late nineteenth century, profoundly expressive in its profound ambiguity. Baudelaire, Mallarmé, the Impressionists in painting and music, Symbolism... So much of it became *spiritual, dreamlike, extra-terrestrial. Abstract*. Things tend to get abstract, you know, when a culture is approaching its demise. Think of Plato’s idealism and the even greater sophistication of Aristotle. In its youth, as in that of an individual, a culture is directed to the concrete and immediate, the naïve and spontaneous; as it proceeds into adulthood and old age, intellectualism sets in, symbolism sets in, the gaze turns toward the transcendent, irony and cynicism and boredom appear as the individual is made more aware of himself in opposition to others. Chromaticism can express all this wonderfully; hence its widespread use in the late nineteenth century.

Art became more ambiguous then because *life* was becoming more ambiguous. Culture, like society, was on the road to nihilism.² Finally in the one came Dadaism and the like (I’d say atonality too, which is supremely “ambiguous”), while in the other came World War I. And on into the 1920s, various literary, musical, and artistic expressions of decadence, of ennui, experimentation everywhere. *Then*, finally, a sort of rupture: the Great Depression, fascism, and World War II. Afterwards the mature, liberal democratic consolidation of corporate capitalism and mass consumerism, a more stable order -- but still despair and alienation in much high art and philosophy, such as Existentialism. New expressions of old alienated impulses, because, in effect, a semi-new society. Then a new eruption against middle-class alienation in the 1960s, a real social idealism throughout much of the world (in most countries, incidentally, not merely “middle-class” but more elemental)...but inevitable failure, and again a partial renewal of

¹ “Phonologically” -- ‘What key are we in?’ -- and “syntactically” -- ‘What’s the meter? Where’s the first beat?’ And “semantically” too, I guess. But I wouldn’t take these linguistic terms too seriously.

² I hope you know I’m not using that term moralistically in my application of it to art. I suppose there is an aesthetic value-judgment implicit in it, but that’s not mainly what I have in mind. I mean it more descriptively than evaluatively.

individualism, materialism, ennui (drug-taking, hedonism), and more “nihilistic” art in the 1970s and ’80s. And so it goes.

To return. Bernstein observes that Debussy’s whole-tone scale is in fact atonal, since it lacks a dominant and subdominant. No circle of fifths is possible, and no traditional modulations are possible. Thus, Debussy’s invention was “the first organized atonal material ever to appear in musical history.” It was also, perforce, the most “ambiguous.” In the *Faun* he followed the old masters in containing his chromaticism and ambiguity with at least *some* diatonicism, but it was clear by that time that the diatonic containment of ambiguity (or of chromaticism and/or near-atonality) was about ready to burst.

It did so in 1908, with Schoenberg’s Opus 11 -- and even more, later, with Opus 21 (or 23; I forget) -- the atonality of which was no longer at all contained by any vestiges of tonality. So a divide opened up in the succeeding years and decades between composers, led by Stravinsky, who still tried to remain in the framework of tonality and others, led by Schoenberg, who abandoned it. Both camps, however, had the same motivation: to increase expressive power. Schoenberg eventually invented his serial method because, having abandoned tonality, he needed a new framework by which to structure music. Otherwise atonal compositions would simply be too *free*, unconstrained by anything. Certain composers seized on his new method, and it (has) lasted for many decades. --It’s revealing, however, that Schoenberg himself said he had continually been pulled back toward tonality, and late in life he even wrote a tonal work for orchestra. This shows the power of tonality, its greater *human* significance (and *physical, nature-al* significance) than something as formalistic, forced, “external,” “intellectual,” and “artificial” as serialism.

Bernstein observes tellingly that no matter what a composer does with music, as long as he is using the twelve notes of the chromatic scale he cannot *totally* escape tonality. Schoenberg himself said that -- he repudiated the word “atonality” because he thought it was impossible. Tonality is implicitly present in the notes, such that even serialist composers are *semi*-rooted in it, despite themselves. And of course they weren’t the first to assay non-tonality; Bach sometimes did, Beethoven, even Mozart, and Liszt, and many others. They would play around the edges of tonality, bring rootlessness to bear on rootedness.

Of all the serialist composers, Alban Berg was the most successful at writing music that could appeal to people. He sometimes managed, unlike Schoenberg and the others, to reconcile or fuse the twelve-tone system with tonality (tonal intervals, regular rhythms, etc.) in such a way that his music could be emotionally compelling to at least a fraction of the public. It helped that he had a greater dramatic sense than other composers, as manifested in *Wozzeck* and his violin concerto.

Bernstein’s thoughts on Mahler are typically illuminating. I’ll quote only a few. “....I had hoped to reach the essence of the tonal crisis through examining [Mahler’s] non-resolution of tensions [in the 9th symphony], his reluctant attempts to let go of tonality -- all of which does shed further light on the inevitable split that was to occur between Schoenberg and Stravinsky. And so I picked up the score again after some years away from it, filled with the sense of Mahler’s torture at knowing he was the end of the line, the last point in the great symphonic arc that began with Haydn and Mozart and finished with him.... But while re-studying this work, especially the final movement, I found more answers than I’d expected, as we always do when we return to the study of a great work. And the most startling answer, the most important one because it illuminates our whole century from then to now, is this -- that ours is the century of death, and Mahler is its musical prophet....” Great eloquence on the tragedy of the 20th century follows. And Mahler, he thinks, hypersensitive Mahler, instinctively foresaw it all.

But to return to Schoenberg vs. Stravinsky. “While Schoenberg was dedicating himself to saving music by continuing that great subjective tradition, the chromatic, romantic tradition, Stravinsky was presiding over a wholly new movement heralding a brilliant new group of composers.... What the great Igor did over that forty-some-year period was to keep tonality fresh by one means or another.” In particular, he reacted against the “almost morbid subjectivism” of German romantic music from Wagner to Schoenberg by embracing a sort of classical “objectivism,” “a cleaner, cooler, slightly refrigerated kind of expression which was the result of placing the creative self at a respectful distance from the created object, taking a more removed perspective on music.” This objective expressivity was already “in the air” when Stravinsky took up his pen, being a reaction, again, to German romanticism. Paris, not Vienna, was the central locus of this new music. For example, already in 1898 Erik Satie was “purposefully avoiding what was then

known as self-expression” in his simple, *detached* pieces. This sort of “anti-art” -- “anti-sincere,” anti-subjective -- attitude was also emerging in painting (Picasso, etc.) and literature. Eventually it would culminate in Dada. But Stravinsky managed to use it to produce beautiful music. Instead of projecting his own feelings and inner conflicts into music, he imagined, for example, “the dreamworld of a pagan Russia” and recorded in *The Rite of Spring* what *it* expressed to *him*. This, incidentally, is why Adorno, whom Bernstein discusses briefly, detested Stravinsky -- because a sincere artist, a sincere composer, “should express his emotions directly, subjectively,” like Schubert, Wagner, and Schoenberg. (Schoenberg? Atonality?? Expressing *emotions*?? Maybe in some sense -- but usually not effectively, since it only alienates audiences.) Stravinsky was the great artificer; hence Adorno’s aversion. But, as Bernstein says, all art involves artifice to some degree, and it isn’t necessarily insincere or inauthentic on that account. Adorno’s perspective on modern music was as absolutist and half-simpleminded as his perspectives often were. And you know he was such a crazy elitist, hating popular music, hating film, hating almost anything most people liked.

What were these artifices that Stravinsky used? How did he succeed in reinvigorating tonality? Through such means as extending triads into sevenths, ninths, elevenths, and thirteenth, thus producing a new sort of dissonance, and through the new concepts of bitonality and polytonality (using two or more tonalities at once). Also, extreme *rhythmic* ambiguities, irregular meters, rhythmic “dissonances.” He even used *polyrhythms*, two or more rhythms at once. And all sorts of musical vernaculars from ancient and modern cultures -- all to inject “fresh air” into a “stuffy post-Victorian room.” All tools for revivifying tonality. And of course they all caught on, spreading like wildfire across the West.

But all this rampant modernist exuberance, all this vitality and humor and irony and folkloric borrowings that spread musically across continents to Milhaud and Kurt Weiss and Copland and innumerable others, was sort of chaotic. How could it be contained? How could it be structured so as not to degenerate into real musical chaos? Stravinsky’s answer: neoclassicism. There had already been a revival of interest in such “classical” figures as Bach, Mozart, and Haydn, as manifested for instance in Busoni’s transcriptions (which were really rather romantic) and in some Strauss and Prokofiev and others. But Stravinsky tied it all together. Bernstein compares him to T.S. Eliot, the master in whom preceding (and succeeding) developments in poetry, anti-romantic, anti-“sincere” and -“subjective” developments (E. E. Cummings, William Carlos Williams, Ezra Pound, etc.), found their culmination. The 20th century *had* to turn away from direct emotional expression because it was so *insecure*. It had to hide itself, its true feelings, because it was embarrassed by too much sincerity. It was too self-conscious and self-doubting. The new century had to speak through a mask, “a more elegant and disguising mask than any previous age has ever used. And it’s the *obliquity* of expression that is now semantically paramount. Aesthetic perceptions are registered at a remove; they are, so to speak, heard around a corner.” *Objective expression*, in short, became necessary. Neoclassicism (as in Eliot) was a “security blanket for the whole literary [and musical] world to clutch at in its sudden death-ridden distress.”

“Hiding behind the mask of *once* directly expressed emotion -- that is the beginning and essential meaning of neoclassicism.” Emotion once directly expressed by John Donne or Mozart or Shakespeare; now we adopt their forms and make allusions to them, to their (comparatively) directly expressed emotions -- we hide ourselves behind them, and indirectly express ourselves through them. Example: “The Love Song of J. Alfred Prufrock.” And Ezra Pound, and Auden, and *Ulysses*, and a whole galaxy of poets using classical forms. “They speak for all of us frightened children grasping for security in the past.” “But doesn’t it betoken an impoverishment of our resources that we must have recourse to the past? On the contrary, it reaffirms our links with the past, our traditions and roots; only we disguise that relationship by coating it in our tough, cool vernacular. But it’s a thin veneer. And when the underlying emotion does shine through, then it hits us with *double* force, precisely because of our shy, frightened attempts to hide it. --Again we’re faced with the ultimate ambiguity: living and partly living, rooted and partly rooted. Remember, just as we found in the last lecture with Schoenberg [i.e., his partial rootedness in tonality]? And so it is with Stravinsky too, in his utterly different way. The one, Schoenberg, tried to control the tonal chaos of modernism through his twelve-tone method; the other, Stravinsky, through the decorum of neoclassicism, exactly like Eliot.” Decorum, yes; but also, like a lot of modern poets, incessant borrowings from the past.

In Stravinsky -- to simplify -- “the personal statement is made via quotes from the past, by alluding to the classics, by a limitless new *eclecticism*. This is the essence of Stravinsky’s neoclassicism. He is now the great eclectic, the thieving magpie....unashamedly borrowing and stealing from every musical museum.” Not always *direct quotes*, but at least stylistic references to past figures.

Throughout all this, of necessity, there is also *humor*. All this semi-plagiarism, it’s all *funny* too. But humor, of course, can “bite deep” and doesn’t have to be frivolous. All of Stravinsky’s mis-matchings and incongruities are funny, but many of them are also intensely serious and poignant. “In the most serious sense, humor in one form or another is the lifeblood of his neoclassicism.” *Irony* is frequently present in Stravinsky, in all his crazy incongruities.

It’s true that eclecticism is usually considered a cardinal sin in artists. But Bernstein defends Stravinsky’s use of it. Adorno “refused to acknowledge the extraordinary power of dramatic irony that could be generated by those egregiously ill-matched components [in Stravinsky, such as his setting a sublime Latin text to machine-like music].... We are *grabbed* by [Stravinsky’s] music, there’s no *escape* from it. As for Adorno, he simply failed to perceive it at all, seeing it only as cleverness, showbiz, theatrical know-how -- which was also true, in a way -- but not seeing the *real* meaning, which is the amazing proximity of comedy to tragedy in our time. He completely missed the joke!--the big existentialist joke which is at the center of most major 20th-century works of art, namely *the sense of the absurd*.”

Having watched these lectures, I understand Schoenberg a little better than before. And Stravinsky too, and all modern music. I still maintain, however, that extreme elitism is a flaw in art. I don’t need “prettiness,” but I do ask for something that can *compel* me without requiring that I first devote years of study to it just to understand it and to *partially* reconcile myself to it. Music in particular should....among other things, should be the “quicken art,” as Kant said, should quicken the heartbeat, quicken life, quicken the emotions and the self’s loss of itself. It’s fine for it to shock, but, after all, you have to draw the line somewhere. When does “ugliness” (etc.) in music become a flaw? Some people draw the line before aleatory music, others before serialism; I’m more of a traditionalist, attached to relatively traditional tonality, and so have more restrictive standards. It’s fine to express “absurdity” in music, or to pursue one’s personal path of self-expression at the expense of popular approbation, but that doesn’t have to be done in *really ugly, boring, almost wholly intellectual* ways. When it isn’t only “much of the public” but *almost everyone* who rejects one’s art even fifty years after its introduction, something is wrong. (I’m referring first of all to Schoenberg and those inspired by him, but also to any artist to the extent that his work, fifty or a hundred years later, remains an object of general disdain or revulsion even among the intelligent, educated public.)¹

Nor do I think it would have been terribly “inauthentic” or inexcusably plagiaristic or hopelessly naïve to write works in styles similar to those of Beethoven or Bach or Schubert or Chopin or Tchaikovsky or even the late Mozart in the 20th century. (Slightly modernized, of course.) Such art is timeless and can express whatever thoughts and feelings you want it to express.

Met a Polish girl from Craigslist tonight, a 36-year-old named Amelia Kowalski. We had emailed a bit beforehand, discussing poetry and the like. For example, she sent me some lovely poems by Adam Zagajewski, commenting that she loves his “gentle, understated luminosity, and a world-weary, but not jaded, sense of transience, and often a wry sense of humor. In person, he’s wonderfully unassuming and sweet.” You can see she’s intelligent and a good writer. Used to be a journalist, in fact, on the “crime beat,” going to crime scenes and morgues, interviewing police, hanging out in very sketchy neighborhoods -- which is why she quit eventually (not wanting to be killed or raped) to become a widely read columnist for

¹ Art should not be *alienating*. It should be, to a great extent, democratic -- as should everything in life, because “democratic” means “human.” The elitism of most 20th-century classical composers was related to the elitism of modern bourgeois society, the economic, social, political, cultural, intellectual schisms and fragmentation. “Bubbles,” such as the academic bubble, the political bubble, the Wall Street bubble....all sorts of elitist bubbles, including in cultural life. Whereas Beethoven tended to be democratic due to the relative *integration* of his society, modern artists have tended to be elitist due to their society’s relative disintegration.

a Christian newspaper, until she had a “crisis of faith” (just as two Christian publishers were asking her to write her memoirs) and went into academia, first to get a Master’s at the University of Chicago in International Relations -- she didn’t like it much there because of the conformism and academic narrowness -- and then to get a Ph.D. at Northwestern, where she is now. Very interesting person; good conversationalist. And pretty. Tall, blonde, thin, feminine. We went to dinner and then up to her apartment so she could give me an umbrella because it was lightly raining; went out back to her deck on this misty romantic night, sexual tension pretty thick, so I stupidly asked if I might kiss her; she recoiled but then seemed to repent. Minutes later we walked to a bar where she’d been the previous night with her friend and had lost her credit card; after recovering it we went back to her place continuing our flirty conversations with the sexual tension thick again in the shadows under the trees in her urban-suburban neighborhood, so I remarked jokingly that “This time I’m *not* going to try to kiss you,” but that did the trick because an instant later we were kissing. And then more kissing, etc. Quite satisfying. She seems to really like me, as I do her. Observed, as another girl had recently, that I act kind of like Woody Allen except not so neurotically. Apparently it’s “cute and charming.” I was indeed somewhat charming tonight, I think, as I usually am with easygoing women who have an ounce of brain in them. It was refreshing to have conversations about history, Marxism, religion, literature (*A Moveable Feast*, *Anna Karenina*), Leonard Bernstein, etc., and later it was all so delightfully playful and flirtatious. A good woman.

Tomorrow I’m meeting another one, from OkCupid. I doubt she’ll compare with Amelia (partly because she’s American, not Polish). And the next day I’m meeting a beautiful Korean girl from Craigslist. A few days later I’ll meet Amelia again to see Woody Allen’s new movie *Midnight in Paris*.

But Aniela, I love Aniela incorruptibly. Not passionately or truly erotically, but there is a special room in my heart reserved for her and her alone. The *gratitude*.

July

YouTube also has a recording of Bernstein’s 30-minute analysis of Tchaikovsky’s 6th symphony, an enlightening discussion of the many elements that unite the symphony into a cohesive whole. For example, the continual use of scale-y motives. A true genius, Bernstein; and broadminded, broad-spirited, in his appreciation of nearly every kind of music out there. Always defending great composers against their critics. And, needless to say, one of the supreme musical educators in history.

Neither the American nor the Korean was particularly interesting.

[The thing with Amelia didn’t last, since she was still entangled with her ex-boyfriend.]

Random observation: A paradox about me is that my sensibilities are democratic and “elitist” at the same time. *Fundamentally* democratic and *fundamentally* “elitist,” in that these sensibilities are *deeply ingrained* in me. For example, I take no notice of social status or stratification -- except negatively, in that, other things being equal, the higher you are, the less respect I have for you. I despise snobbery; I despise educated self-satisfaction; I despise the conformism of the elite; I despise technocratic, even “liberal” (welfare-statist) technocratic, management of society; I despise “expert wisdom.” In short, I have contempt for everything artificial and inhumane. *Institutions* are my enemy, and the more top-down they are, the more horrible they are. I love authentic popular culture, its music, its folklore -- its spontaneity and humanity. I love the genuineness and kindness of ordinary people who haven’t been corrupted by modern society. Etc., etc. [...] But really what it all comes down to, I think, is that my sensibilities are *humane*: anything that speaks to me of *kind humanity* is what I love. Great classical music expresses “kindness” and/or “humanity” in a variety of ways (broadmindedness, universal fellow-feeling, a democracy of the spirit -- and human creativity, etc.); certain traditional cultures express these concepts in other ways. Insofar as I’m an “elitist,” it’s because that which I have scorn for is neither kind nor *human*, in the noblest sense.

Reading *Workers Across the Americas: The Transnational Turn in Labor History* (2011), edited by Leon Fink. In her contribution, Aviva Chomsky writes the following:

Charles Bergquist has convincingly argued that the different forms of coerced and free labor that developed in different regions of the Americas during the colonial period played a key role in the emergence of the contrasting socioeconomic and political structures of, say, Haiti (or even Alabama) and New England. The colonies that produced the most wealth ended up the poorest. While Terry Karl looks at the impact of natural resources, primarily on states, Bergquist places labor systems at the center of the analysis: exploitable resources led to exploitative labor systems, which structured long-standing inequalities in the distribution of land, wealth, and power.

It's a striking and obvious fact: in places with rich, exploitable natural resources, there has been a tendency for those resources to (indirectly) bring poverty and misery to most of the population. Conversely, places like England, New England, much of Europe, and Japan, which aren't terribly well-endowed with natural resources, have become rich and powerful. New England, for example, developed *industry* because its agriculture couldn't compete with that of other areas. As it happens, industry can bring greater prosperity for more people than agriculture, probably because it is more conducive to workers' *coming together* and successfully making demands on their oppressors.

...Now reading *Shaping American Telecommunications: A History of Technology, Policy, and Economics* (2006), by Sterling, Bernt, and Weiss. Wondering if I should write my dissertation on telecommunications, since it's a transnational thing that will, moreover, be around for a long, long time. So if I write something good, it could be relevant for quite a while.

...That book is rather boring, so now I'm reading *Solidarity Transformed: Labor Responses to Globalization and Crisis in Latin America* (2011), by Mark S. Anner.

In the globalized world, he notes, "Even the simplest of items, such as a T-shirt, might be designed in San Francisco, use fabric made in Hong Kong, be sewn together in Honduras, shipped to Miami, and sold in a mall in New Jersey." That reminds me of Marx's concept of commodity fetishism. All that we consumers encounter is the finished product, which seems like it's some magical thing that has appeared fully formed out of nowhere. The social relations involved in its production and distribution are unknown to the consumer. All the vicious exploitation of workers, the capitalist networks of wealth and power, the human labor and sweat that creates the product, the incredibly complicated authoritarian hierarchies....they're all invisible to the consumer, who sees only a clean, shiny new product sitting on a shelf in a store. That's commodity fetishism. Being forced to be ignorant of *human connections*.

This international dispersal of production has destructive implications with regard to labor solidarity. Some of the reasons are obvious, but I'll quote this passage anyway:

Labor in internationally restructured industry is now often dispersed and divided by language, culture, and distance. This undermines the ability of workers to communicate across borders while also increasing the social distance between workers and upper-level managers who are located in their home countries. In cases where corporations have numerous factories producing largely identical products across the globe, the ability of workers to leverage for higher wages through strike activity in one factory is greatly reduced....

Cost structures are also transformed in ways that are detrimental to production workers. In the old, traditional, "full-production" systems, a firm purchases its production inputs, transforms the inputs into the final product, and then sells its product. Under internationally segmented regimes, MNCs [multinational corporations] purchase inputs in one location and ship them to *independent* firms in another location, companies under contract by MNCs that transform the inputs into a final product or into a component of the final product. The MNCs, which own the final product, distribute it to retailers, or sell it directly to consumers.

In the traditional system, producers could negotiate the price of inputs or change suppliers to keep costs low. In the segmented system, this is not possible. Here the

multinational firm, not the factory owner, purchases the inputs. This means that labor costs as a percentage of total costs for assembly plants are much higher in segmented systems, which, as economist Alfred Marshall observed long ago, reduces labor's bargaining power since there is less of a margin to increase wages without adversely affecting the viability of the enterprise. For example, workers demanding a wage increase where labor costs are 80 percent of production costs will face much stiffer employer resistance than workers demanding a wage increase where labor costs are only 10 percent of production costs.

Secondly, in the traditional system, the producer sells the final product directly to the consumer or through retailers. When production costs increase, these traditional firms have the option of raising the sale price of the goods they make. In the segmented system, the multinational enterprise never relinquishes ownership of the final product and thus the supplier firm cannot benefit from an increase in the sale price. [If the supplier firm demands a higher price for the product it is making, the corporation can simply find another assembly plant that won't charge as much.] The result of both these processes -- high labor costs as a percentage of total costs and an inability to increase the sale price -- create pressures on firms to keep wages lower than in traditional manufacturing.

If Wal-Mart squeezes its suppliers, they're forced to squeeze their workers or go out of business. This "buyer-driven," "monopsonistic" dynamic applies especially to low-end industries like apparel. The situation is a little different in high-end industries like auto production, but with the new phenomenon of "modular production," in many countries the auto industry has become more difficult to unionize and characterized by lower pay. There are more female workers too (who are able to push the buttons that operate robots and such), not the middle-aged, high-paid male workers who predominated in the classic age of Fordism.

Remember when I've said in the past that one of my slight handicaps in attempts to impress women -- i.e., to *dominate* in some sense -- is my small head? You probably thought that was crazy or just some idiotic excuse. Needless to say, you were wrong: my idea, which is really quite obvious, has been indirectly confirmed by science. As reported in *The Independent* recently, a study conducted at the University of Wisconsin-Milwaukee found that "Men's facial width-to-height ratio is generally a positive signal, evolutionarily speaking. Specifically, when men compete for resources with other men, relative facial width is a strong sign of aggressive, self-interested behaviour." (And thus female-attracting behavior.) Why? Probably because a wide face tends to impart a feeling of power. Like all forms of bulk (in men). More interestingly, men with wide faces are more likely to lie and cheat, because of their confidence. "The studies involved testing a group of 192 business students to see how readily they were prepared to either lie or cheat in order to gain an advantage over a competitor. Men with wider faces were about three times more likely to lie and about nine times more likely to cheat compared to narrow-faced men."

Reading Jesse Lemisch's little book *On Active Service in War and Peace: Politics and Ideology in the American Historical Profession*, presented as an essay at the lively 1969 convention of the American Historical Association but published later (by an obscure left press because it wasn't mainstream enough to make it into establishment journals). A professor recommended it to me after reading my paper for his class that criticized historical scholarship. In his introduction, Thomas Schofield explains that in 1969 Lemisch was "a historian who had been dismissed from the University of Chicago because 'his political concerns interfered with his scholarship.'" In what may [have been] the most telling and fundamental critique presented before the AHA he proposed that the supposedly unpolitical stars of the profession (Allan Nevins, Arthur M. Schlesinger Jr., Samuel Eliot Morison, Oscar Handlin, Daniel Boorstin and others) were implicit cold warriors who sought to use history as a vehicle in the fight against communism. Lemisch's paper....argued persuasively that what so many object to is not that a scholar should take a political position but that he should hold views contrary to establishment shibboleths." Duh. To argue that mainstream scholarship is "free from bias" is and was so wildly naïve as to be laughable. The guardians of every

mainstream institution in history have been certain they're right and "unbiased"; it's one of the most predictable things in human existence, and one of the most ridiculous. *Everything* -- or *nearly* everything -- is political and "biased"; there are political and social relations, and political and social value-judgments, implicit in every (or nearly every) act. When you ignore a homeless person on the street, that's implicitly a political act. When you write scholarship that is sympathetic toward the powerful and ignores the powerless, that's political. When you spend your evening drinking with your friends rather than volunteering at a shelter for battered women, that's political. The way a man treats his wife is political, as is the way she treats him. Society is saturated with power relations; there is no escaping them. And such relations are always at least indirectly political.

So it is impossible to be unbiased or unpolitical. But as I said in my paper, it is possible to be *less* "biased," *more* objective, namely by being more "radical." As long as you accept such broad values as individual self-determination, democracy, the non-killing of innocents, and so forth, a consideration of facts in the light of these values will lead you to what are called "radical left" positions.

Lemisch's writing is, at times, delightfully inflammatory. No compromising with complacent liberalism.

Discussing the anti-radical ideology of respectable "politically neutral" liberal historians and social scientists such as Arthur Schlesinger Jr. and Daniel Bell, Lemisch easily refutes Bell's "end of ideology" thesis by pointing out that, umm, the 1960s weren't very "un-ideological." In fact, Bell's little hypothesis, like Francis Fukuyama's little "end of history" hypothesis thirty years later, was nothing but the ideology of a few self-satisfied technocratic circles in the American elite at a specific point in time.

More interestingly, Lemisch puts short work to the Consensus idea that McCarthyism was the product of an earlier populist tradition (the implication of which claim is that populism, hence the "vulgar mass," is irrational, paranoid, undemocratic, etc.). In fact, so-called "McCarthyism" obviously began several years before the rise of McCarthy, in the late 1940s, with all the Truman-imposed loyalty oaths and the purging of the labor movement and all that rabid anti-radical bullshit. In other words, it was the *elite* that was paranoid, undemocratic, and irrational, not the people. But even regarding McCarthy himself, the smug liberal hypothesis is false:

[In *The Intellectuals and McCarthy*, Paul Rogin] has tested the pluralists' contention that there was continuity between McCarthy and earlier agrarian radicalism [e.g., that of the 1890s] and found it invalid. Testing the contention in the Senator's home state, Wisconsin, Rogin finds entirely different social bases for McCarthy and [Progressive Senator Robert] LaFollette. McCarthy rose on a conservative constituency, the traditional source of Republican strength. Progressivism in Wisconsin "mobilized poor Scandinavian farmers against the richer areas of the state"; McCarthy "rose to power with the votes of the richer German inhabitants of the farms and small cities in southern and eastern Wisconsin...." Those counties which had been Progressive "tended to oppose McCarthy more than other counties in the state."McCarthy did not represent any "new" American right -- just the "old one with new enthusiasm and new power."

In Rogin's analysis, McCarthy emerged from conservative rural politics -- which is far from mass politics, but rather the politics of local elites. Thus, for instance, Leslie Fiedler's contention that McCarthy's support by small-town newspapers was an indication that McCarthyism was another movement toward "direct democracy," continuous with Populism, is practically reversed when examined more carefully. Small-town newspapers in fact had an enduring record of opposition to agrarian radicalism; such newspapers are generally the voice of conservative local business interests, and it was these small-town business people who formed a part of McCarthy's base. Thus, Rogin notes, McCarthyism was a movement by a "conservative elite -- from precinct workers to national politicians...." It "flourished within the normal workings of American politics, not radically outside of them" and was "sustained not by a revolt of the masses so much as by the actions and inactions of various elites."

As I said months ago, then, McCarthyism was not so much populist as “faux populist” -- if even that. “McCarthy,” says Lemisch, “is evidence for the evils of too little democracy, not too much.” It’s the same with the Tea Party movement nowadays. And even with the old racist George Wallace, to an extent. “Rogin has found the early support for George Wallace stronger among the middle and upper class than among the working class. ‘Is “middle-class authoritarianism” a more fruitful concept than working-class authoritarianism?’ he asks.” Public attitudes on the Vietnam War were another example of how the masses are often less conservative than the elite.

In fact, Lemisch argues convincingly that postwar liberal pluralism (“legitimate” groups competing against each other in the political arena, “countervailing powers” balancing each other) was a kind of Burkean conservatism transplanted to modern conditions. Many Consensus historians and social scientists admired Edmund Burke and disdained Thomas Paine and the French Revolution, indeed all radicals and even the abolitionists, as having fallen victim to the naïve and dangerous faith that men could make their own history, could remake society in the light of reason and reject old traditions. Like Burke, these postwar liberals found “wisdom” in traditions and institutions, and insisted that the essential flaws of “human nature” would always vitiate radicalism. Their polemic, of course, which shaped their understanding of history, was against Communism, but they broadened it to apply to all radicals of the past and present, to everyone who was discontented with mere technocratic management of society. Schlesinger Jr. and his ilk were basically anti-democrats who, like Burke -- as well as nearly all of America’s founding fathers, and nearly all intellectuals and elites in history -- radically distrusted the people. But because they lived in a society that exalted democracy, they had to pay lip-service to it while rejecting its substance. [What they really valued were “stability and equilibrium.” For these people, says Lemisch, “stability and equilibrium were the goals of society,¹ and since the society called itself democratic, then stability and equilibrium must *be* democracy.”²]

All these observations should be painfully obvious to anyone who has read anything, but they’re worth repeating.

Lemisch savages all these smug, lazy liberals, exposing their ideas as establishmentarian tripe. It’s fun reading.

In spite of themselves, they indirectly grasped a truth: national politics in the U.S. has, with rare exceptions, always been more or less a matter of “consensus.” The U.S. has been basically a one-party state for a long time. Arguably since the beginning. As Chomsky says, variation and disagreement are permitted within fairly rigidly defined boundaries, which have always excluded the radical left. These facts result from many circumstances, including the electoral system and the elitist framework of the Constitution.

....Later in the essay he turns his attention from ideas to actions, specifically actions taken by all the liberal historians and social scientists in the heady days of 1968 and 1969. The revelations aren’t surprising, but they expose these intellectuals as contemptible hypocrites. Celebrating democracy and freedom while justifying and participating in violent repression against students and radical professors, who were “threatening the foundations of democratic order.” Hofstadter, Handlin, Boorstin, Bernard Bailyn, Schlesinger Jr., Seymour Martin Lipset, Bell, Leuchtenburg, Eric Hoffer, Nathan Glazer, Lewis Feuer, Bruno Bettelheim, and many others: conservative establishmentarians obsessed with relatively small disruptions of their ordered little worlds at the same time that bombs and napalm were killing and mutilating millions in Indochina. *That* was not wrong (at worst “imprudent”); *student dissent*, on the other hand, was morally horrifying, the very death-knell of civilization, a resurgence of something like Nazism.

One of the less egregious examples is Schlesinger writing in 1969 on police violence against Harvard students. While “invoking the police may on occasion be necessary to preserve academic freedom,” at Harvard it was wrong. Or, to quote Lemisch’s paraphrasing of Schlesinger, it was “not precisely wrong, but rather, imprudent; it was not the fact of ‘cops clubbing Harvard and Radcliffe students’

¹ Cf. Talcott Parsons’ sociology, which became all the rage in the 1950s.

² As a result, student dissenters in the 1960s were -- paradoxically -- “undemocratic,” in that they upset stability and equilibrium.

that offended him [Schlesinger] but the ‘*spectacle*’ of it, which ‘obliged the S.D.S. and illustrated its favorite thesis of the hidden violence of American society.’” And we all know how absurd that thesis is. It would be ridiculous to deny that America is a fundamentally peaceful place. (Peaceful for Harvard professors, at least.)

--Excellent, impassioned essay. Well done, Jesse. *Écrasez l'infâme!*

Now reading Walter Rodney's classic *How Europe Underdeveloped Africa* (1972). Like Robin Hahnel, he postulates two main mechanisms: exploitation through trade and exploitation through investment (i.e., imperialism). The former has to do with the terms of trade. For example, the big capitalist countries effectively establish the prices of minerals and agricultural products and “subject these prices to frequent reductions,” thus harming Africa's economy (depriving it of revenue). They also set the prices of the manufactured products *they* produce, which of course are higher than those of the former category. *Imperialism*, on the other hand, as manifested for instance in Europeans' ownership of land and mines (and banks, factories, etc.) in Africa, entails the outflow of revenue from Africa to the foreign owners, which forestalls African development. It also takes the form of loans to African governments, which have to be repaid with interest. Again, an outflow of wealth.

“The things which bring Africa into the capitalist market system are trade, colonial domination, and capitalist investment. Trade has existed for several centuries; colonial rule began in the late nineteenth century and has almost disappeared; and the investment in the African economy has been increasing steadily in the present century. Throughout the period that Africa has participated in the capitalist economy, two factors have brought about underdevelopment. In the first place, the wealth created by African labor and from African resources was grabbed by the capitalist countries of Europe [and the U.S.]; and in the second place, restrictions were placed upon African capacity to make the maximum use of its economic potential -- which is what development is all about.”

In addition to all this, obviously you have to take into account the fact that many African political leaders have for a long time been tools of the West and so haven't acted in the best interests of their people. Corruption, etc. And the frequent military coups and constant political instability have had an adverse impact on African development (as they have in Latin America).

Rodney's survey of Africa before the colonial era is instructive. Some good ideas, too. E.g., regarding the debate whether there was an “African mode of production” as there was an “Asiatic mode of production,” he simply states that his assumption will be that most African societies before 1500 were in a transitional state between communalism and feudalism -- “the practice of agriculture (plus fishing and herding) in family communities and the practice of the same activities within states and societies comparable to feudalism.” They were slowly evolving, not on the basis of *class antagonisms* -- because in communalism there are no true class antagonisms -- but just on the basis of “the fundamental forces of production.” All these myriad societies -- “pastoralists and cultivators, fishing societies and trading societies, raiders and nomads” -- were being “progressively drawn into a relationship with the land, with each other, and with the state, through the expansion of the productive forces and the network of distribution.” In some cases, such as Ethiopia and Egypt, full feudal states emerged.

Before 1500 the techniques of agriculture in most of Africa were not quite as advanced as in Europe and other regions. Why? Because of the absence of classes. In Europe, for example, it was feudal landowners and, later, capitalist farmers who were responsible for the development of advanced techniques of production. “Where a few people owned the land and the majority were tenants [as in much of Europe], this injustice at a particular stage of history allowed the few to concentrate on improving their land. In contrast, under communalism every African was assured of sufficient land to meet his own needs by virtue of being a member of a family or community. For that reason, and because land was relatively abundant, there were few social pressures or incentives for technical changes to increase productivity.”

In Asia, on the other hand, where much of the land was communally owned, it was the *state* that initiated tremendous advances in certain types of farming.

Rodney's discussion makes clear that manufactures and trade in Africa prior to European colonization were by no means as primitive as is commonly thought. The quality of many manufactured items was for a long time superior to that of Europe's manufactures (though in Europe manufacturing was

on a larger scale). Social stratification even in the more primitive parts of sub-Saharan Africa was also noticeable, families with the largest herds, for example, being socially and politically dominant, sometimes to the extent that a particular family became effectively the “ruling” one. Of course with military conquests, too, relations of domination and subordination developed.

Among the areas that were highly advanced in 1500 were the Maghreb, the Western Sudan (Senegal, Mali, Niger, and parts of Mauritania, Guinea, and Nigeria), Kongo, Benin, and even, to a lesser extent, Zimbabwe. All these regions and more were well on the way to sprouting full-fledged feudal kingdoms.

But then Europe got in the way. Rodney’s argument is that over four and a half centuries, “Africa helped to develop Western Europe in the same proportion as Western Europe helped to underdevelop Africa.” From the beginning, Europe determined that Africa’s main export was to be human beings, who would be used to produce wealth in the Americas.

“The fact that Europe was the first part of the world to move from feudalism towards capitalism gave Europeans a headstart over humanity elsewhere in the scientific understanding of the universe, the making of tools, and the efficient organization of labor. *European technical superiority did not apply to all aspects of production, but the advantage which they possessed in a few key areas proved decisive.*” (His italics.) Very true. Europeans had better killing-technology, and they were better at producing *practical* goods, as opposed to luxuries.

He gives many examples of how trade with Africa contributed to the economic development of Europe. For example, “gum from Africa played a part in the textile industry, which is acknowledged as having been one of the most powerful engines of growth within the European economy.” And Africa’s export of ivory was important. And don’t forget that many of the products from the Americas would not have existed without the African slave trade. “It would have been impossible to open up the New World and to use it as a constant generator of wealth had it not been for African labor.” Also, in England, “it was the county of Lancashire which was the first center of the Industrial Revolution, and the economic advance in Lancashire depended first of all on the growth of the port of Liverpool through slave trading.” Several English banks, too, became large enterprises from the profits derived through slave trading. And James Watt, who invented the steam engine, was financed by slave owners. Etc., etc. Of course the U.S., too, benefited enormously from the slave trade and slavery itself.

As for the negative impact of the slave trade on Africa, it isn’t necessary to observe that the theft of millions of healthy young people from the continent wasn’t particularly good for economic development.

Aside from the slave trade, contact with Europe led to the stagnation of industry. “India is the classic example where the British used every means at their disposal to kill the cloth industry, so that British cloth could be marketed everywhere, including inside India itself.” It wasn’t as dramatic in Africa, but the effect was the same. “African and Indian trade strengthened British industry, which in turn [partly by investing profits in new technologies] crushed whatever industry existed in what is now called the ‘underdeveloped’ countries.”

Trade with Europe ultimately remade the African economy so that it was dependent on Europe. Even to do business with each other, local economies tended to become reliant on Europeans as intermediaries (because of their command over the sea, which was an efficient way of trading). The former integration of African markets thus deteriorated. “It has now become common knowledge that one of the principal reasons why genuine industrialization cannot easily be realized in Africa today is that the market for manufactured goods in any single African country is too small, and there is no integration of the markets across large areas of Africa.”

The main point is that *trade* with Africa stimulated *production* in Europe and America. Africa became oriented to mere trade, not production, exchanging raw materials for manufactured goods. But Africa’s trade itself was of a destructive nature, not only because so much of it involved the selling of people but also because it was trade with *external* countries, not with other African markets (or only indirectly).

It should be emphasized, however, that until the 1880s, when Europe began to conquer Africa *militarily* and to dominate its politics, African countries and communities were by no means mere colonies

of Europe. Politico-military structures were, on the whole, still independent. Evolution towards mature feudalism continued in many regions, with social structures and ideologies remarkably similar to those of European and Japanese feudalism.

But in the late nineteenth century things changed, because European capitalism had become so dynamic that it had to invest in undertakings outside the home market. The domestic scope for expansion was too limited; higher profits could be realized by investing abroad, controlling raw material supplies, and finding new markets. "Africa's greatest value to Europe at the beginning of the imperialist era was as a source of raw materials such as palm products, groundnuts, cotton, and rubber. [Hitherto it had mostly been ivory, gold, and slaves.] The need for those materials arose out of Europe's expanded economic capacity, its new and larger machines, and its increasing wage-earning population in towns."

Consider Egypt under Mohammed Ali (who ruled from 1805 to 1849) and afterwards. He tried to develop industry by instituting protective tariff walls around Egypt's "infant industries," importing experts from Europe, etc. The development of Egypt, however, was "diametrically opposed to the needs of European capitalism. British and French industrialists wanted to see Egypt not as a textile manufacturer but as a producer of raw cotton for export, and an importer of European manufactures. European financiers wanted Egypt to be a source of investment, and in the second half of the eighteenth century they turned the sultan of Egypt into an international beggar, who mortgaged the whole of Egypt to international monopoly financiers. Finally, European statesmen wanted Egyptian soil to serve as a base for exploiting India and Arabia. Therefore, the Suez Canal was dug out of Egyptian soil by Egyptians, but it was owned by Britain and France, who then extended political domination over Egypt and Sudan."

In some areas of the world, such as Latin America and Eastern Europe, political sovereignty was left in the hands of the local population even during the imperialist era. Not in Africa, though.

European capitalists came to the decision that Africa should be directly colonized. There is evidence to suggest that such a course of action was not entirely planned. Britain and France up to the 1850s and 1860s would have preferred to divide Africa into informal "spheres of influence." That means that there would have been a gentlemen's agreement that, say, Nigeria would be exploited by the British merchants while Senegal would be exploited by Frenchmen. At the same time, both Englishmen and Frenchmen would trade in a minor way in each other's informal empire. But, firstly, there was disagreement over who should suck which pieces of Africa (especially since Germany wanted to join the grabbing); and, secondly, the moment that one European power declared an area of Africa as a protectorate or a colony, it put up tariffs against European traders of other nationalities, and in turn forced their rivals to have colonies and discriminatory tariffs. One thing led to another, and soon six European capitalist nations were falling over each other to establish direct political rule over particular sections of Africa.

Rodney also points out that racism played a large role in motivating Europeans to seek political domination over Africa. The "inferior race" had to be "civilized" by force. (Economics, after all, is not the only causal factor in human affairs.)

To repeat, the main theme of colonialism was the expatriation of surplus produced by Africans out of Africa and into Europe. Europe was developed in the same proportion as Africa was underdeveloped. In addition to this, the exploitation of African workers was much worse than that of European workers, so much so that Africans had to supplement their wages with subsistence farming just to survive. Therefore, the profits that mining companies, for example, made from African labor were astronomical. "Superprofits."

The African working class under colonialism, however, was very small. By far most of the Africans involved with the colonial money economy were independent peasants growing produce such as cocoa, coffee, cotton, and palm oil to be sold to local businessmen (usually Arabs or Asians), who then sold it to Europeans. "The share of profits which went to middlemen was insignificant in comparison to those profits reaped by big European business interests and by the European governments themselves." European trading

companies “held the African farmer in a double squeeze, by controlling the price paid for the crop and by controlling the price of imported goods such as tools, clothing, and bicycles to which peasants aspired.” In fact, the terms of trade for African exports of raw materials and imports of manufactured goods deteriorated throughout the colonial period, not because of any objective economic law but just because “unequal exchange was forced upon Africa by the political and military supremacy of the colonizers.” The concept of the “protected market,” or the colony that has to accept whatever terms of trade are imposed on it by its overlords, highlights this fact.

In addition to all this private exploitation and more (e.g., some European banks made even higher profits than mining companies, ultimately by appropriating surplus produced by laborers), the colonial governments exploited their subjects by taxing them -- to pay the costs of their own subjugation. “Public works” projects were also common, whereby Africans were forced to work for a certain number of days per year on castles for governors, barracks for troops, prisons for their own countrymen, and roads, railways, and ports “to provide the infrastructure for private capitalist investment and to facilitate the export of cash crops.” It is well known, too, that forced labor was frequently used for the direct benefit of business interests.

“Men like Arthur Creech-Jones and Oliver Lyttleton, major figures in British colonial policy-making, admitted that in the early 1950s Britain was living on the dollar earnings of the colonies.”

Aside from the sheer financial gains from imperialism and colonialism, the metropolises benefited from the fact that the international-division-of-labor system stimulated the development of technology, skills, and the organizational techniques of the capitalist firm. “Indeed, colonialism gave capitalism an added lease of life and prolonged its existence in Western Europe.” A hard statement to prove, but probably true. As usual, Rodney gives many examples to support his argument. In a sense, however, one of the main points of his book is virtually a truism: without the metropolises’ relations with Latin America, Africa, and Asia, the capitalist system could hardly have achieved anything remotely comparable to what it has, and Western societies could not have become remotely as wealthy as they have. If the world consisted only of North America, Europe, and Japan, then yes, things [in these places] would be very, very different. The interesting part of his argument (which is really all of it) is in the identification of *mechanisms* of development and underdevelopment.

Among his many excellent points is the observation that exploitation of the colonies “took the edge off” the contradictions of capitalism in Europe, especially the contradiction between capitalists and workers. “Surplus from Africa was partly used to offer a few more benefits to European workers and served as a bribe to make the latter less revolutionary. The bribe came in the form of increased wages, better working conditions, and expanded social services. The benefits of colonialism were diffused throughout European society in many ways....”

Another good observation (randomly selected) is that we shouldn’t fetishize (in Marx’s sense) “investment” or think of capitalists as doing some great service to humanity when they invest their money in projects that happen to have constructive uses. “It is necessary to reevaluate the much glorified notion of ‘European capital’ as having been invested in colonial Africa and Asia. *The money available for investment was itself the consequence of the previous robbery of workers and peasants in Europe and the world at large.* In Africa’s case, the capital that was invested in nineteenth-century commerce was part of the capital that had been derived from the trade in slaves.” (My italics.)

Apologists for colonialism sometimes argue that, despite all its evils, it was at least responsible for modernizing Africa. Not true. “The most convincing evidence as to the superficiality of the talk about colonialism having ‘modernized’ Africa is the fact that the vast majority of Africans went into colonialism with a hoe and came out with a hoe.” Colonialism thus failed to change the technology of agricultural production. More generally, it failed to properly industrialize Africa. When indigenous industries did start to sprout, governments quickly blocked them on behalf of metropolitan industrialists. “Groundnut-oil mills were set up in Senegal in 1927 and began exports to France. They were soon placed under restrictions because of protests of oil-millers in France. Similarly in Nigeria, the oil mills set up by Lebanese were discouraged.” Africa was useful to the metropolises only as a source of raw materials. Skilled labor was, by and large, not allowed to develop.

Another obvious example of colonialism's destructive impact on Africa was the phenomenon of "monoculture." "The term 'monoculture' is used to describe those colonial economies which were centered around a single crop. Liberia (in the agricultural sector) was a monoculture dependent on rubber, Gold Coast on cocoa, Dahomey and southeast Nigeria on palm produce, Sudan on cotton, Tanganyika on sisal, and Uganda on cotton. In Senegal and Gambia, groundnuts accounted for 85 to 90 percent of money earnings. In effect, two African colonies were told to grow nothing but peanuts!" The disadvantages of monoculture, which at times became lethal to millions of people, are self-evident. (Utter dependence on metropolises, the risk of disease spreading across a country's one crop, price fluctuations that left farmers helpless, a lack of agricultural diversification resulting in malnutrition and disease, etc.)

"The factor of dependency made its impact felt in every aspect of the life of the colonies, and it can be regarded as the crowning vice among the negative social, political, and economic consequences of colonialism in Africa, being primarily responsible for the *perpetuation* of the colonial relationship into the epoch that is called neo-colonialism."

...Now reading *Labor and Capital in the Age of Globalization: The Labor Process and the Changing Nature of Work in the Global Economy* (2002), edited by Berch Berberoglu. In his chapter, Harland Prechel discusses the Fordist and the "neo-Fordist" ways of organizing the workplace. Here's a brief summary:

In response to the capital accumulation crisis that resulted in the Great Depression, Fordism gradually replaced Taylorism, but was only fully implemented in the post-World War II era. Fordism continued the trend of centralizing control by transferring workers' knowledge to managers, incorporating workers' 'know-how' into the production machinery, and creating taller managerial hierarchies. Fordism also continued to fragment tasks and specialize work activities. A primary characteristic of Fordism was the mechanization of the production process by reincorporating the various tasks into an assembly line. This reorganization of the labor process required several layers of management to supervise the various tasks and specialized work activities.

This chapter analyzes neo-Fordism, the third mode of control based on principles of scientific management, in the age of globalization. I will demonstrate how neo-Fordism computerizes information flows to further centralize control, making it possible to eliminate several layers of management and reduce the decision-making authority of lower and middle managers....

It's not a great book, so instead I'm reading Richard Du Boff's *Accumulation and Power: An Economic History of the United States* (1989), recommended by Chomsky. It's good, since it takes a Marxian/Keynesian approach. Here's the first paragraph: "Just after the Second World War, economists of the Keynesian, Marxian, and institutionalist schools shared one vision -- that nothing in the workings of a capitalist economy assured compatibility between the demand side and the supply side requirements for steady growth with full employment. For several reasons this approach to economic history soon fell by the wayside (if in fact there were ever any attempts to make use of it). This book represents an effort to revive it."

The first chapter consists of a polemic against neoclassical economics and its version of economic history. Boff's analysis "focuses not on consumption and production choices in an allocative efficiency setting [as neoclassical analyses do] but on capitalist decision-making and its social consequences. That decision-making process is not seen as a series of adaptations to external market forces but rather as the major determinant of the pattern of economic growth and as the main element forcing change in the economy at large. In this view, the twin goals of capitalist enterprise are *accumulation* and *monopolization*." Neoclassical theory likes to treat monopolies as a kind of pathology, an extreme departure from "perfect competition" or "equilibrium" or some other invented concept, but anyone with common sense understands that monopolies are "the natural end product of successful competition, arising out of accumulation and the drive for control over an economy never in 'equilibrium.'"

Okay, now for the history. “The earliest impetus to economic growth came from foreign trade, which boomed from 1793 to 1807. Revolutionary turmoil and the Napoleonic wars in Europe allowed American shippers to capture a major part of the international carrying trade and led to unprecedented volumes of exports and profits.... Exports probably constituted 15 percent of the national product....” America’s export-led economic growth ended in 1807 with the Embargo Act, which was a catastrophe for shipping interests. But it had the beneficial effect of encouraging goods-production at home, since goods were not available from Europe. “The growing demand for cloth prompted the mechanization of weaving and the integration of spinning and weaving inside a single ‘mill.’” Unfortunately, the end of Europe’s war in 1814 reopened the U.S. to British imports, which drove many American competitors out of business and wiped out much of the newly expanded manufacturing base, “bringing a decade of near-stagnation.” (If the IMF weren’t the slave of Western investors, it might draw certain conclusions from such facts as these. Opening Third-World markets to floods of Western goods is precisely the worst thing to do, from the perspective of the Third World.)

Nevertheless, in some sectors manufacturing continued to expand, slowly. In textiles, for example, where a few large firms survived the British onslaught. Also, residential construction grew, stimulating the production of nails, bricks, shingles, etc., as well as the machines to make them. At the same time, the Northeast’s “commercial revolution” was happening. Commercial banks, law firms, insurance companies, etc. Public works in transportation and communication were important too. The growing volume of trade bred a new generation of middlemen, who themselves contributed to economic development. And state governments provided crucial help by chartering corporations, giving companies monopoly-type privileges and attracting wealth from small investors whose calculations of risk were influenced by their “limited liability.” On top of all this, agricultural productivity was rising in the West.

Real per capita incomes rose 30 percent between 1805 and 1840. The urbanized population was 11 percent by 1840. On the other hand, “by the 1830s the sense of social distance between rich and poor was growing,” as a new class of wage-earners slowly developed. *Slowly*. By the 1840s, less than 10 percent of all workers were engaged in manufacturing. The structure of the economy remained pre-industrial.

“The modern accumulation process began in the 1840-1860 period, with the coming of the railroads.” I won’t go through all the ways that railroads stimulated economic development. The telegraph, too, proved to be of incalculable importance. Both accelerated the emergence of a national market, and of regional specialization.

“Agriculture’s share of the labor force declined from 64 percent in 1840 to 53 percent in 1860; in the North the decrease was even greater, from 63 to 34 percent.” At the same time, disparities in income and wealth (i.e. property) were increasing (although real wages for working people did rise). “By 1860 income disparities had risen to a ‘high plateau of inequality’ that persisted for the better part of a century.” (And then, you know, a few decades of the welfare state, and then a resumption of extreme polarization.) Inequality in wealth was even worse.

One sign of strong capital accumulation in the 1840s and 1850s was “the revulsion against internal improvements,” i.e. public works, which had been quite significant earlier.

The defeat of national planning for internal improvements was no doubt related to the growing sectional conflicts, especially between the North and the South, and agitation for “states’ rights.” But the private business sector was also starting to oppose “government interference” in the economy. The ideological reaction apparently began with the great expansion of 1843-1857, when a generation of capitalists began to sense the burgeoning opportunities that lay in free-wheeling exploitation of new technologies and new markets. The telegraph provides evidence.... With the swift commercial success of telegraphy, a campaign for public ownership was undertaken by a number of congressmen and private citizens. Opposition was strong and effective from the outset. “Who should own the Magnetic Telegraph?” asked the New York *Mercantile Advertiser* in 1846. Surely not the Post Office was the reply, because of “its utter inefficiency, and its absolute inability to

meet the wants of the public.... In comparison with *individual* enterprise it is perfectly contemptible....a bungling concern.”

Actually, historians have shown that the postal system was an astonishingly effective institution for its day. But the “private enterprise” and “government inefficiency” propaganda had already begun by the 1850s.

After the interruption of the Civil War, things heated up. Investment shot up simultaneously with the growth of consumer demand. Per capita incomes rose at a brisk pace. “Real income per person increased at an annual average rate of about 1.1 percent from 1800 through the 1850s; after the Civil War the rate jumped to 1.6 to 1.7 percent per year through 1900.” In the long run, growing demand has to come from improvements in productivity, “otherwise higher demand levels are not sustainable. Only increases in the productivity of labor and capital can give the economy the added capacity to generate or accommodate more ‘demand.’” These necessary increases in productivity were happening at a great rate in the second half of the century, during the “second industrial revolution.” These are the years when mass production began, and giant business firms sprang up.

And yet, as always, economic growth was wildly disrupted by depressions and downturns. Between 1867 and 1900, “the economy expanded during 199 months and contracted during 197 -- a disappointing if not ominous performance in view of the glowing images the new capitalists were fashioning of themselves and their economic system.” Why such crisis-laden growth? I think you know the answer. It is “capitalism’s endemic problem of maintaining levels of aggregate spending high enough to prevent productive capacity from outstripping demand.... [S]cience-based gains in efficiency....permitted huge expansions in productive capacity that tended to overshoot actual levels of private demand. The main problem lay in a system that encouraged efficiency gains but discouraged a distribution of income that could assure commensurate gains in worker purchasing power.” In general, labor-saving and capital-saving innovation, cost-cutting, “tends to generate excess capacity, as a given amount of investment becomes more productive and capital-output ratios [and surely labor-output ratios too] undergo a long-term decline.”

I won’t summarize Boff’s long discussion of the second industrial revolution and the great merger wave around the turn of the century. Let’s continue with the theory. The point about the structural contradictions of capitalism is that in a regime of imperfect competition, “actions designed to promote profitable investment undermine economic stability -- and the investment that depends on it.” For example, if events cause a corporation to cut back production and investment but *not* reduce prices, weakness in the economy will develop. Demand will grow more slowly, and the oligopolistic firm will cut its output levels. Excess capacity will then appear. “In a *competitive* regime, underutilization of plant and equipment brings on price cutting and the demise of marginal firms. But under oligopoly the excess capacity cannot be competed away like this; in recessions total profits may shrink but excess capacity remains in place.” Investment will therefore continue to drop; consumers, being paid less and being employed less, will have less money to buy things and to service their debts, which could lead to defaults, which could interrupt cash flows and profits to banks and other lending institutions, which could precipitate a crisis in the financial system.

Labor-saving measures reduce production costs for a firm, but they also constrain consumption spending. Aggregate demand might therefore become insufficient to warrant further investment, which sets in motion the vicious circle. Also, because of all the cost-cutting, profits tend to grow....faster than good investment prospects. Which tends to lead to economic stagnation.

I wonder how this emphasis on the malign effects of “excess” profits squares with Brenner’s emphasis on the malign effects of a low rate of profit. It’s funny that both high and low profits can be macroeconomically injurious. (Well, it isn’t the high profits themselves that are the problem; it’s the low demand that might be their obverse side, because it augurs badly for economic growth and profits in the long run.)

There are various ways around these problems, such as strong labor unions that insist on high wages (although if production costs increase *too* much, profits can be squeezed, which will tend to lower investment), but “they do not automatically prevent a mismatch between the nation’s productive capacity and the purchasing power to keep it utilized. There is, for example, no reason why the growth of demand

that results from a given rate of investment should be exactly equal to the growth of capacity that results from that investment.”

It’s true that “over the past century or more, expansionary forces have prevailed.” There have been three great waves of economic expansion. But this wasn’t so much the result of the free market as of powerful *external* stimuli. “Epoch-making innovations” such as the railroad and the automobile opened up vast new frontiers of investment -- as Paul Sweezy argues.

But the basic problem never disappears. Sometimes capacity increases at very rapid rates, especially when the productivity of new capital goods is rising, at other times mass-purchasing power and final sales lag, and at still other times both phenomena occur. As a result, breakdowns of the investment-dependent system have been so severe that government has increasingly been called upon to guarantee stability not only through “regulation” but also by massive expenditures to prevent aggregate demand from collapsing as it did in the 1890s and the 1930s. The tension between forces making for expansion and contraction has not abated. Since 1929 it is easily discernible in the debate over the role of government in the economy, as well as in the business cycles that somehow keep happening.

Even after the depression of the 1890s had ended, when prosperity had returned, industrial spokesmen complained about excess capacity in the midst of prosperity. As one said, “We need to open our foreign markets in order to keep our machinery employed.... It can produce in six months all we can consume in a year.” And that was at a time of vigorous economic growth, in 1900. From 1907 through 1915, “real GNP grew very slowly, at an annual average rate well below 2 percent per year.” One important author later concluded (in his study of the pre-war downturn) that “increased industrial productivity [during those years] did not result in any substantial addition to the real income of employed workers in general.” As Boff says, “This suggests a tendency to divert productive gains toward profits rather than wages, with an eventual dampening effect on economic activity.”

You know about all the oligopolistic stuff that was happening in the early 1900s, so I won’t go through that. All through the 1920s, trade associations and continual mergers and a permissive federal government ensured that competition was, “to a very considerable extent,” controlled. That’s the way things tend to be under corporate capitalism. Capital, as you know, did very well in the 1920s -- but “the increasingly promotional and financial basis of [the] merger movement indicates a surplus of funds seeking speculative profits, as opportunities for productive investment profitable enough for the corporate sector were waning.” Remind you of anything? For example, our economy’s financialization over the last thirty-five years, as “opportunities for productive investment profitable enough for the corporate sector” have waned? Yes, we’re on the verge of another great depression. Or at least a very protracted slump.

Also, just like in recent decades, retail chains [characterized by low wages] did unprecedentedly well in the 1920s.

“What were the forces making for a sustained economic expansion [in the 1920s] that finally pulled the nation out of the doldrums of 1907-1915?” Boff’s answer is simple: “The energy behind a vigorously growing market economy comes chiefly from a core of dynamic young industries. Between 1917 and 1929 electrification and automobiles provided the key investment outlets that came to fruition after World War I. They overrode the depressive tendencies of the oligopolistic investment mode, at least long enough to allow the economy to expand for several years without significant interruption.” The statistics he gives for electrification prove the stunning importance of this new industry to economic activity in that era. The statistics for, and in general the importance of, automobile manufacturing, however, are simply mind-boggling. As before with steam power and railroads, “the accumulation possibilities opened up by automobiles invigorated the whole economic machine.” Think of all the “forward and backward linkages,” the many industries stimulated and created, the proliferation and expansion of roads and billboards and filling stations and garages and truck driving and building construction and suburban communities and

highway construction largely financed by state and federal governments that came to the aid of flagging private investment. Even in the 1930s it was already impossible to imagine the world without automobiles.

So why did this economic boom come to an end in 1929?

As the 1920s stretched on, the prolonged investment boom was sowing the seeds of its own demise, through its contributions to increasing productivity and inadequate consumer purchasing power. The years following the First World War were ones of record-breaking increases in efficiency, in output per worker and per unit of capital stock. The reasons are clear -- electrification, automotive transport, and widespread mass-production innovations, with expanding markets and longer production runs bringing still greater economies of scale. The end of mass immigration in 1921 threatened to restrict the supply of labor and push up wage bills, leading employers to substitute machinery for labor at an even faster rate and to squeeze more production out of existing work forces through "human engineering" techniques.

So, while productive capacity was expanding quickly, "consumer demand could not seem to keep pace." This problem was quite troubling to industrialists and business economists; they did everything they could to raise demand for their products. But capacity utilization declined in the second half of the decade. The main problem was that, even though the real earnings of non-farm employees rose substantially in the 1920s, most of the increase went to people in upper-income brackets, who never spend as much of their earnings as less wealthy people do. (A similar problem today.)

Also, oligopolistic industries, as stated above, were (and always are) resistant to significantly lowering prices (as a way to pass on productivity increases to consumers). Instead, they tended to cut back production and employment, which hurt demand. "From 1929 through 1932, prices in competitive industries fell 60 percent compared to only 15 percent in 'the more concentrated industries.'"

As Boff says, however, all this might well have led not to a devastating depression but only to a characteristic recession. An important aggravating factor was, of course, the stock market plunge in late 1929. Earlier that year a downturn in business activity had already begun, but "the stock market debacle shattered business confidence, ruined countless thousands of private investors, and wiped out holding company and investment trust structures by the score. It effectively compounded factors making for output and employment drops that would not by themselves have produced a prolonged and desperate economic crisis."

Basically, the situation was that heavily indebted holding companies controlling much economic activity paid interest on their bonds out of the profits of the individual operating companies they owned. The decline in profits that began earlier in the year "led to defaults on a number of bonds and a series of spectacular bankruptcies. Meanwhile, the Wall Street collapse was drastically raising the cost of issuing new corporate equity and closing off this source of cheap finance as a way out.... Investment and consumption soon began to sink. As sales and prices fell, large corporations responded by reducing their outlays for inventory and capital goods and increasing their holdings of cash balances, withdrawing funds from the economy's spending stream...." The vicious circle had begun. Farmers and others faced shrinking markets for their goods, bank failures spread as loans could not be repaid, millions of Americans withdrew their bank deposits, etc. On top of all this, Hoover's misguided fiscal policies and the Fed's misguided monetary policies (it raised interest rates in late 1931 to protect the nation's gold reserve) made things worse.

"In Europe a similar crisis was swiftly developing, and as Europeans demanded gold, banks all over the world had to call in loans and shrink deposits. A new wave of liquidations, international in scope, followed. In the summer of 1931, the jerry-built house of international credit, debt, and war reparations finally gave way, crushing the last hopes for a 'normal' recovery."

"The anemic nature of the recovery during the 1930s was a direct result of inadequate increases in government support for the economy."

Boff's conclusion: "What had really happened between 1929 and 1933 is that the institutions of nineteenth-century free market growth broke down, beyond repair. Had the chain of circumstances been 'right,' it could have occurred in 1920-21 or possibly 1907. The tumultuous passage from the depression of the 1930s to the total economic mobilization of the 1940s was the watershed in twentieth-century U.S. capitalism...." State intervention blunted capitalism's crisis-prone tendencies even as it created "unanticipated additions to the full range of capitalist instability."

Okay, so during and after World War II things got better, etc. Except for a series of short recessions, like the one that started in late 1948, when excess capacity appeared and private investment started falling. Luckily the Korean War happened in 1950, temporarily saving American capitalism from itself. And the pattern continued for a long time thereafter. "There is little doubt that the major growth stimulus for the American economy from 1950 through the early 1970s came from the public sector, not private investment." In fact, Arthur Okun, who was chairman of the Council of Economic Advisers under Lyndon Johnson, said that this expansion of government should be judged "not in dollars of real GNP, but in the very survival of United States capitalism." It was government spending that prevented another Great Depression from happening. In the 1950s and 1960s, military spending accounted for more than four-fifths of all federal purchases. But "military spending" is not just for the military (as Chomsky often notes); it is really a sort of "backhanded planning" for various sectors of the economy.¹ "The record-breaking, 105-month-long economic expansion from February 1961 to November 1969 was largely a result of arms spending."

It's also worth noting that in the postwar era, government's taxation of profits and other non-wage earnings (for the sake of public spending, which increased aggregate demand) helped prevent excess productive capacity from developing to the extent that it might have. And excess capacity, to repeat, can trigger a recession by causing a decline in investment.

Let's not forget automobiles. While the industry was important before the war, it was probably even more important afterwards. As usual, government had to do much of the investing and assumption of risk, but automobiles and their economic offshoots were a monster stimulus to private investment too. (Think of suburbanization.) The "Los Angelizing" of the American economy occurred after World War II. But, as I learned from Chomsky, that name is misleading, since Los Angeles was not always the car-cluttered hellscape it is now. It used to deserve its moniker "City of Angels," being a paradise on earth. Beautiful scenery, very little pollution, quiet electric public transportation, no crisscrossing highways everywhere.... Unfortunately, "between 1936 and 1950, National City Lines, a holding company sponsored and funded by GM, Firestone, and Standard Oil of California, bought out more than 100 electric surface-traction systems in 45 cities (including New York, Philadelphia, St. Louis, Salt Lake City, Tulsa, and Los Angeles) to be dismantled and replaced with GM buses [and cars and highways]. It was understood that the sale of automobiles, gasoline, and tires would benefit too. The project was generally successful. In 1949 GM and its partners were convicted in U.S. district court in Chicago of criminal conspiracy in this matter and fined \$5000."

Don't forget, too, that the federal government was mostly responsible for the development of electronics in the 1950s and afterwards. Also synthetics (plastics and fibers).

Okay, let's skip ahead to the downturn after 1972. From 1973 to 1987, unemployment averaged 7.2 percent. The growth of private investment slowed considerably, manufacturing declined as the commercial sector (retail, communications, real estate, insurance, services) rose, debt increased all around, etc. You know it all from Brenner's book. To keep aggregate demand from collapsing as it did after 1929, the government has relied on military spending. This form of public spending, as opposed to infrastructure programs, "has highly functional characteristics for American capitalism." "Military output does not interfere with or saturate private demand. Pentagon dollars jeopardize no business interests because they

¹ Economic and ideological opposition to government programs that "compete with private capital or encroach on its domain" prevents the federal government from directly funding sufficient public works on infrastructure and so forth, so it has to take the indirect route through the Pentagon, which is less efficient than the alternative (something like the WPA or the TVA of the 1930s). See Chomsky's *Understanding Power*.

go to private firms, providing support rather than competition. The same cannot be said for low-cost housing, Amtrak and mass transit, public recreational and wilderness projects, and many social services like legal aid for poor households. A sizable expansion in areas like these would have disrupting effects on private production and on free labor markets. It would also demonstrate that the public sector can provide certain goods and services more effectively than private profit-seeking companies -- a 'bad example' to be blocked at all cost."

Moreover, military spending has the advantage of reproducing the oligopolistic structure of the corporate economy, "as it consolidates the power of some of the largest firms in concentrated sectors of the economy."

In addition to military spending, transfer payments like Social Security, Medicare, and food stamps help stabilize the economy by helping to stabilize demand. But as you know, "welfare" spending has been slashed in the last 35 years. In fact, despite increases in military spending under Reagan and afterwards, since 1972 state, local, and federal government support for the economy has plunged. "The relentless attacks on 'big government' by a resurgent right wing, anchored in the Republican party but well represented among Democrats, have borne their bitter fruit -- a reduction of the amounts of public spending necessary to generate sufficient aggregate demand to keep the economy operating at a high level of employment and output. The laboratory test is the great postwar boom: in the absence of the rapid growth of government spending from 1947-48 to 1972-73, the economy would probably have exhibited the same stagnationist tendencies evident since 1973. With reduced growth of both investment and government spending, it is not surprising that the overall economy -- GNP -- has turned in such a poor performance since the early 1970s."

So what caused the downturn after 1972? Boff blames it on numerous things, including exogenous shocks like the OPEC happenings, worldwide shortages of commodities as a result of crop failures, and two devaluations of the dollar in 1971 and 1973....but he also mentions causes internal, or relatively internal, to the system. Like Brenner, he invokes heightened international competition, which depressed profitability and thus investment, productivity, etc. Lower productivity growth also resulted from the higher global prices of energy and other raw materials, which discouraged investment in energy-intensive plant and equipment. And "rising labor compensation" -- not in wages but from increases in the "social wage" (such as employers' contributions to Social Security, health and disability, and pensions) -- combined with lower productivity growth to squeeze profits. Apparently from 1965 through 1979, employers' "supplements to wages and salaries" increased much faster than money wages and profits. They went from 6 percent to 12 percent of national income.

Incidentally, if you're wondering what the relation is between Brenner's emphasis on lower profit rates (due to international competition) and Boff's emphasis on lower aggregate demand as explanations for the long downturn, I'd suggest that the lower aggregate demand was partly a result of the low profits.¹ Business had to cut costs to lower prices to compete with imported goods, which meant lower wages and less employment, which meant less effective demand. Which meant more excess capacity, which reinforced tendencies toward reduced growth of investment, which meant lower productivity growth, etc. A vicious circle. Heightened international competition wasn't the *only* trigger, but it was an important one. Boff might say that it ended up reinforcing -- ironically -- the stagnationist tendencies of America's oligopolistic economy (by encouraging greater cost-cutting....which *didn't* result in the "shakeout" of less-productive firms, as would have been the case in a more "purely competitive" economy, because of all the ways that oligopolistic firms in modern America have of staying in the game, including by relying on debt, on the government's military Keynesianism, on corporate tax cuts, on financial speculation, on investments in real estate and insurance, etc.).

So recessions got more severe. Boff notes, however, that recessions are functional for capitalism, and since the mid-1950s have always to some degree been policy-engineered. From the perspective of capital, they do "curative work" for the economy. They reduce inflation, assure adequate supplies of compliant labor, and "check speculative financings" that can imperil coordinated expansion of a market

¹ Of course in the long run it contributed to them, too.

economy. Recessions can restore conditions for profitability. Government's role is to "allow a recession but to stop it short of catastrophe."

Boff has a deprecatory attitude toward Reagan's supply-side economics. He doesn't even think it was particularly new. "Regressive tax legislation and assaults on labor were nothing new in U.S. history, but now they were reinforced by 'deregulation' -- the decontrol of regulated industries and the gutting of regulatory agencies that protect workers and consumers." Another new development of those years was that "as deficit spending encouraged consumption to race ahead of domestic output, imports filled the gap and foreign savings financed both the budget and trade deficits. That was the 'new' feature of supply-side economics -- foreigners supplied the goods and the funds."

Needless to say, one of the effects of all the deregulation of recent decades has been an acceleration of "the long march toward oligopoly," as an analyst for the Wall Street Journal wrote in 1985. The fourth merger movement began (the first being the one between 1890 and 1902).

Boff's final word on the long downturn is that "events since 1972 have done nothing to dispel the view that the chronic problem of capitalism is insufficient private-sector aggregate demand to keep production and employment growing." He quotes an author: "Throughout the entire industrial phase of U.S. economic history the system has operated below its potential, with full employment obtaining only in brief spans surrounding cyclical peaks.... The decade of the 1970s thus reveals the face of long-run stagnation, unleashed by the demise of the state and local stimulus together with the failure of the federal government to compensate for this demise." Brenner wouldn't agree with that diagnosis, but there's some truth to it. Boff immediately qualifies it, however, by repeating that one of the most significant factors was the change in the structure of the world economy beginning in the late 1960s.

"Supply shocks" raised production costs and impaired existing industrial capacity in the United States (and elsewhere), so that Keynesian demand stimulation would have produced only a marginal output and employment increase, but probably a significant rise in inflation. [This, of course, is what happened.] But this constituted no reason to reject Keynesian economics, as conservatives (and many neoliberals) so quickly proclaimed it did. All economists agree that any decrease in productive capacity tends to cause a rise in prices and a fall in the quantity of output.¹ The *response* to the supply shocks of the 1970s actually validated Keynesian theory, as tight fiscal and monetary policies depressed economic activity, generated persistent unemployment, and further discouraged the investments needed to get out of the trap.² This period, moreover, was also marked by growing competition among capitalist nations, creating an oversupply of capital stock on a world scale in textiles, steel, motor vehicles, shipbuilding, and other industries. Even during the 1970s, the old excess capacity dilemma was at work -- and expanding to global dimensions, with companies in North America, Europe, and Asia fighting for the same markets.

It's possible that Boff puts too much emphasis on exogenous "supply shocks" and not enough on intensified international competition.

In the light of all these Keynesian ideas, it's even more clear to me than before that the government in 2011 is virtually digging the grave of American corporate capitalism by *dramatically* cutting spending, even military spending!³ The economy is going to get worse and worse for years. A full-fledged depression

¹ (Um, but there continued to be *excess* capacity too, right? Not enough demand, right? *And* -- you're saying -- not enough supply? That's a little confusing.)

² But Brenner would argue that in order to *really* get out of the trap, an even more severe recession, or depression, would have been necessary first, in order to "shake out" all the unproductive capital in the economy. Indeed, Boff himself said as much a few pages earlier.

³ (Actually, upon inquiring further I've learned that all the talk about cuts to defense spending is bullshit. Orwellian doublespeak. It only means reductions in the *projected future growth* of defense spending. Not actual *cuts*.)

might well break out. Will it be possible to reconstruct corporate capitalism in its aftermath? Doubtful. -- Capitalism's contradictions cause its downfall!

I won't summarize the last two chapters of the book, but I'll mention a couple convincing arguments Boff makes about the nature of corporations -- arguments I'd heard before, and which have always seemed obviously true to me. First, enormous size doesn't entail enormous efficiency. Corporate consolidation often happens at the expense of efficiency. (Market power, which doesn't seem to correlate with technical efficiency, is profitable.) Second, "giant companies are not the fountainhead of technological progress. The largest firms do not support R&D more intensively relative to their size. Small, independent inventors, unaffiliated with any industrial research facilities, supply a disproportionate number of inventions like air conditioning, the jet engine, [and] insulin. 'Radical new ideas,' *Business Week* concluded in a 1976 survey, 'tend to bog down in big-company bureaucracy. This is why major innovations -- from the diesel locomotive to Xerography and the Polaroid camera -- often come from outside an established industry.'"

Such facts suggest that Schumpeter's optimistic "creative destruction" theory "might be turned on its head. The revised sequence would be that, for big business, profitable growth strategies are linked to the attainment of market power, which often engenders bureaucratic management and conservative policies. Excess profits can accrue long enough to lull corporate giants into a false sense of security. Among the predictable results would be technological lag, periodic attempts to shore up profits and power through mergers, and administrative hypertrophy."

*

Sent Chomsky a couple of questions about Bertrand Russell's theory of descriptions and the law of the excluded middle. His response: "Strawson was right in recognizing [in his paper "On Referring"] that referring (in ordinary usage) is an action, and that the notion that there is a relation of reference between words and things in natural language is at best dubious (in my opinion completely false). But Russell's theory of descriptions was not designed to mirror ordinary usage. It was a tool for mathematics and mathematical logic. The question is what to make of mathematical statements like 'the first even prime larger than two is greater than 100.' --Same with the law of the excluded middle." Okay. But it does seem that Russell intended his theory to apply to ordinary sentences, such as "The present king of France is not bald." And no one will ever be able to convince me that that sentence is both true and false (on two different interpretations -- as Russell argued) rather than neither true nor false. So, insofar as the theory of descriptions and the law of the excluded middle are supposed to apply to propositions in natural language, they're surely wrong. They may be true, however, of mathematics and mathematical logic.

*

What will happen?-- The rich will keep getting richer, the poor poorer, the *public* state smaller and the *private* state bigger; the economy will continue deteriorating, public services disappearing, the national security state expanding (in part to keep in check an ever-more-restless citizenry), public education collapsing. My question is, what will be the *creative underside* of all this destruction? For there always is such creativity; the germs of the future are sown in the present. To survive, people will have to join together, will they not? They will not be able to rely on the state as they have, since welfare, social services, education, labor regulation, and other things formerly provided and administered by the state are being gutted. But *how* will they join together? And when? When will the creative "backlash" become visible? What forms will it take? Of course a "backlash" against business has been going on for years, but insofar as it is nationally visible it is largely doomed to defeat in the short run, as it has been on the ever-retreating defensive for decades. *This* is not the backlash I'm talking about, at least I don't think so. Society in its present form will collapse, destroyed by the depredations of the "market" (or capital) -- but what will arise in its stead??

*

It's hard for me to take seriously people's responses to me, whether positive or negative, because in different circumstances they would have responded in the opposite way. It is never just *you* to whom people respond, but *you in such and such conditions*. An indefinite number of external factors enters into people's attitudes toward one another.

On the other hand, these attitudes are rarely *groundless*. They are merely not as grounded as they pretend to be.

*

The hundreds of dates I've been on in my life, and the hundreds of parties I've attended, and the thousands of superficial acquaintances I've made, have diminished my enthusiasm. I'm heartsick, and I'm tired.

*

Like all great thinkers, Marx had some good ideas and some less-good ideas. Consider his ideas on revolution. He was right to see the crux of the matter as always being the relation between two polarized classes, because that is the pivot of (non-communal) societies. In antiquity the central structure was landowners vs. slaves; in feudalism it was landowners vs. serfs; in capitalism it is capital-owners vs. wage-workers. To speak in functionalist terms, these dichotomies are what make possible the production of the economic surplus that is necessary in order for the society to continue functioning, the surplus that is distributed in various ways amongst all sectors of the people. In causal terms, the people with greatest control over resources, which means over production relations, will exert their power to keep intact the relations that benefit them. The reason there is always only one central class structure instead of several is that the method of organizing production that extracts the most surplus with the least cost will tend to spread at the expense of other, less efficient or less powerful modes of production until it predominates. That is, the "representatives" of the most wealth-producing mode of production will accumulate power at the expense of representatives of less effective modes of production, until the whole society is structured around the interests of the former.¹

Thus, a transition from one form of society to another occurs with the inauguration of a new dominant class structure, a new mode of production. And it comes about through the breakdown of the old class structure (possibly accelerated by the gradual emergence of a more dynamic mode of production, as in the transition in Europe from feudalism to capitalism). The Roman Empire succumbed to inefficiencies and problems in the slave-based organization of production; feudal Europe succumbed to problems and inefficiencies -- especially relative to emergent capitalism -- in the serf-based organization of production, as did the rest of the feudal world when it came into contact with capitalism. But it hasn't been just "productive inefficiencies" that have doomed all previous class-based modes of production; *class conflict*, whether implicit or explicit, has also been essential. For example, it was largely through the agency of the peasantry (in its conflict with landowners) that feudalism fell in France, Russia, and China. In the same way, if or when capitalism collapses it will be through the agency of wage-workers in a sort of alliance with worker-owners, the representatives of a higher mode of production. But before that happens, *implicit* class conflict² will start to cause the downfall of capitalism, as capitalists accrue more and more power, the economy becomes more and more polarized, and society becomes more and more dysfunctional.

¹ Think, for example, of the North's destruction of the South's mode of production during and after the American Civil War. Barrington Moore was right to consider that war essentially a kind of capitalist revolution.

² Or rather, *explicit* on the part of capitalists. Think of their current attacks on public-sector unions, and their attacks on the welfare state.

Where Marx went wrong, as I've said many times before, was in *some* of his predictions of the *specific mechanisms* of capitalist downfall, as well as its timeline. His basic mistake was not to foresee the statist period of capitalism, or "state capitalism."¹ Fascist Europe, the Soviet Union, Communist China, the U.S. after the 1930s (or even before), and many other examples amounted to variations on the theme of state capitalism or monopoly capitalism or corporate capitalism.² (The Communist countries certainly were not socialist or communist; it is convenient, therefore, to call them ultra-statist, ultra-bureaucratic versions of capitalism, given that capital accumulation was the guiding principle of the system. Conversely, from even before the mid-20th century the U.S. was in many respects a planned economy.³) Had there been no state to intervene in the conflict between labor and capital so as to stabilize society, it is possible that some kind of post-capitalist social revolution would have happened in the early 20th century. But the nation-state matured with capitalism in such a way that they were inseparably united; the development of each reinforced the development of the other. So there had to be a statist "interlude." But it was also inevitable that capitalism would continue growing, continue internationalizing, continue exploiting labor in other, cheaper countries -- especially as international competition intensified -- and thus would continue eroding the boundaries and authority of nation-states, in part by virtue of its ability to play off one country against another. As capital became more and more gigantic, states would have to become more and more subservient to it and indebted to it (literally). Slowly, therefore, in losing what little autonomy it had had earlier (in the 1940s and '50s, for example), the state would cease to be as socially stabilizing as it once was. Class conflict and polarization would be allowed to resume; regulation of economic activity, being inconvenient to capital, would be dismantled; society would become more dysfunctional and crisis-ridden. Only at *this* point would advanced capitalist countries begin to enter a revolutionary era, an era of enormously *protracted* revolution. The nation-state had to erode before the era of (transnational) revolution could begin.

*

There is something beautiful in the fact that musicians in Asia and Africa regularly play pieces by Mozart, Bach, Beethoven, and the others. Millions of Asians and Africans devote their lives to this music and make it their own. That is beautiful, that implicit and without-a-second-thought recognition that some things are the heritage of humanity and not of a specific culture. Beauty transcends its culture and becomes human.

*

Mozart wrote his 36th symphony in four days.

*

L'èse majesté.-- Noam Chomsky has had an incredibly lucky life. His childhood was spent in an unatomized, idealistic, intellectual culture with fascinating relatives whom he regularly visited (in New York). Until high school he went to a progressive experimental Deweyite school that he loved. From childhood he knew his future wife Carol, and they married at a young age, thus sparing him the infinite frustration of being an eccentric intellectual who has to spend years looking for the right woman, meeting hundreds of the wrong ones. Soon after entering college he met Zellig Harris, an inspirational, brilliant man who guided

¹ To say it differently, he didn't appreciate the power of the nation-state as a principle in human affairs.

² [Actually, in the light of the following, it's misleading to equate corporate and state capitalism. For, if I'm right, the nation-state is declining even as corporate capitalism is thriving as never before -- *because* corporate capitalism is thriving as never before (except maybe in the 1920s). The state-corporation nexus is still paramount, but the state is becoming weaker relative to capital (*transnational* capital) than it used to be.]

³ To an extent, it has always been a partially planned economy, like every other country.

him and convinced him to study linguistics and not drop out of college. Through personal connections, having published little or nothing, he was given a professorship at MIT at a young age. (He was lucky enough to live in a time when it was easy to get an academic job.) Later he became an anti-war activist and would have gone to prison for a long time -- was about to go to trial -- if the Tet Offensive hadn't happened just then, saving him. (It convinced the U.S. government to start winding down the war¹ and to end its prosecutions of activists like Chomsky.) And so on. The man is charmed.²

*

Artists, whether in literature, music, the plastic arts, theater, or anything else, are an interesting breed. The more you talk to them or watch them on talk shows or read about them, the more you realize that the majority are bores, buffoons, clownish narcissists, self-indulgent alcoholics, narrow-minded fools, etc. Watching videos of Jack Kerouac and others....you need a shower afterwards.

*

Chomsky likes to say that Americans are basically responsible for the crimes of their government, because they live in a relatively free society that allows them to influence politics. But there is only a small amount of truth to that. If you consider Americans as a group, all 300 million of us, then yes, in a sense you can say that this *group* is partly responsible for its government's acts. But *individuals* are not. It would be *impossible* for me to influence federal policies (or at least policies that mattered). I simply cannot stop the government from deporting undocumented immigrants, or from launching drone attacks in Pakistan that kill civilians, or from failing to enforce labor laws. In these respects I have *zero* power -- or, rather, approximately infinitesimal power. Which means I am not responsible, or my responsibility is approximately infinitesimal. That doesn't mean I shouldn't try to do what I can to influence government policies, since from an "absolutist" or "deontological" perspective you can argue that I have an obligation to do so, but realistically what I do either doesn't matter or, if I miraculously succeed in having influence *as an individual* on policies, it will take decades for my acts to lead to some *minor* concrete change. Chomsky himself can do virtually nothing to change policies (as he has admitted)....so what chance do I have? What chance does (almost) anyone have?

Is Chomsky responsible for policies he hates? Of course not. He has effectively no power, which means effectively no responsibility. (By paying taxes that fund bad policies, yes, there is a *tiny* element of responsibility. But one's refusal to pay taxes wouldn't have the slightest impact on policies, so, in the end, one doesn't really have any responsibility for them even if one pays taxes (because *not* doing so wouldn't matter).)

In a sense, Chomsky is right to publicly blame ordinary Americans: doing so can potentially shock them out of complacency. But that's a tactical consideration, separate from what I've been discussing.

*

Requiescat in pace, capitalismus.-- A reasonable way to interpret the West's history in the last century is that the contradiction in capitalism between the tendencies towards increased supply (or surplus value) and decreased demand (or the *absorption* of surplus) finally reached a crisis point in the 1930s, and would have destroyed capitalism had the state not stepped in. The state had to artificially raise demand by using tax revenues and debt-financing to direct spending and income-redistribution where it had to go in order to keep the system running. Eventually, however, the state's debt reached unsustainable levels even

¹ More accurately, it convinced a small group of former cabinet officers, generals, presidential aides, and ambassadors, sometimes called the Wise Men, to advise Lyndon Johnson to start de-escalating operations because the war was unwinnable and was hurting the country. Johnson obeyed dutifully.

² He himself has acknowledged the huge role of luck in his life.

as the capitalist class was pushing hard to cut taxes and end income redistribution (as well as economic regulation, which was essential to keeping the economy healthy), with the consequence that a return to relatively pure, less state-regulated capitalism took place. Not surprisingly, this coincided with a return to severe economic crises and an insufficiency of effective demand. The West approached a situation similar to the one at the end of the 1920s and beginning of the 1930s. Statism could not be the answer this time, given the already high government debt and the internationalized (“free-trade”) conditions of the world economy. The [national] state was on its way out; hence, capitalism was (almost) on its own now. Which meant that, seemingly, it was doomed to protracted paroxysms of stagnation. Unless the developing world, particularly China and India, could save the system, there was no hope for it.

*

Mumia Abu Jamal is right to refer to America’s “prison-industrial complex.” Prisons may be America’s most dynamic growth industry. Communities want prisons to be built in them because they provide jobs. Prisoners are the raw material, so to speak, on which employees work; and corporations make fantastic profits off the construction of prisons and the exploitation of cheap prison labor. At the same time, sending millions of black and Hispanic males to prison for minor offenses rids society of an economically superfluous population that, as it grows, threatens to “destabilize” corporate capitalism. So capitalism has accomplished the impressive feat of making a *business* of getting rid of people whom capitalism has made economically redundant and politically dangerous. Finding a way to make profit off the redundant and unprofitable, *precisely by protecting capitalism from them* -- that’s genius. Satanic genius. That it happens to destroy millions of lives is an unfortunate externality.

*

A lot of mainstream people would criticize me for immersing myself in leftist scholarship and journalism, which they would say is a close-minded or partisan thing to do. They would say I should expose myself to *all* kinds of writing, not only the leftist variety. Actually, such a criticism is silly because I *do* read writings from a variety of viewpoints. In my courses, for example, I have to read mainstream scholarship, and every day when I peruse the internet or read my roommate’s copy of *The Economist* I’m exposed to mainstream and conservative journalism.¹ Aside from this, however, the fact is that among leftist writing there is a greater proportion of *good* stuff, honest and critical stuff, than among mainstream and conservative writing. That judgment has nothing to do with my “ideology”; it is simply a fact. Nor is the explanation hard to think of. For one thing, journalists and commentators in the mainstream usually do not have to carefully give a lot of evidence to establish their claims, because it is relatively rare that anyone will challenge them (or their narrative framework, at least). If what you say is consistent with the dominant narratives propagated all over society by power-centers, most of your audience will simply take what you say for granted. If, on the other hand, you are challenging conventional narratives, people will demand evidence.² Thus, taking an oppositional stance to the mainstream, or to power-centers, itself tends to foster a mindset of intellectual integrity -- because that’s the only way you can even get a word in.

Related to this is the fact that, because most people and institutions everywhere are constantly trafficking in mainstream ideologies and perspectives, it is relatively *easy* to do the same yourself. A scholar or journalist in the center or on the right usually does not have to dig deep, uncover hidden truths and think

¹ Some of which is pretty good. Much of the business press has good, factual reporting (the *Wall Street Journal*, the *Financial Times* -- though rarely the *Economist*, which is ideological pablum) -- but often such reporting, even in the business press, is precisely *leftist* in its implications and orientation. More leftist than anything you’ll read in the *New York Times*. Some of it could appear in *ZMag* or *Dollars & Sense*.

² On the other hand, if you’re Chomsky, your careful citing of masses of evidence will be ridiculed as intellectual bullying or as “his customary blizzard of citations” or something like that. Ultimately, the only way you can satisfy the guardians of mainstream orthodoxy is by espousing their own conventional ideologies.

critically about his intellectual framework. An author on the left, however, does. His whole project is to put forward views and uncover stories that are being ignored or no one knows about. All the better that these tend to be the *human* stories, the *concrete*, *factual* stories, stories about workers striking against corporations, people protesting wars, billions living in sprawling slums, public services breaking down everywhere, women being sold into sex slavery, governments colluding with corporations, arms being shipped from the U.S. to governments that use them to suppress labor movements, governments ignoring the popular will (demonstrable from polls), economic polarization reaching new heights every year, or democracy and the middle class historically being born from the efforts largely of the working class and the labor movement, etc. All this and much more is *true*; the writings of a Milton or Thomas Friedman, or an Arthur Schlesinger (in his Kennedy years), or a William Buckley, are transparently superficial and partisan, if not dishonest.

Ironic that it's the *leftists* who have always been accused of being ideological and biased! They're doing little but reporting facts and putting self-evident interpretations on them;¹ it's the centrists and conservatives who tend to be ideological and biased.

*

Liszt's transcription of Schubert's song "Frühlingsglaube." Listening to this at 1:00 a.m., what does one write to communicate the mood? What I told Aniela in my email to her with the link to the song is pitifully inadequate: "I love this magical midnight mood, serene and nostalgic, quiet as though nothing else exists in the world. Except you. :)" It is a piece that stops time. It is release.

*

"Strength" is a false ideal. An artificial, a meaningless ideal. The only ideal that matters is *humanity*.

*

How did I attain the relative emotional maturity I've reached? In the most immature age in history, living in almost complete emotional and intellectual isolation, and loving the sweet melancholy of midnight and Chopin, how have I succeeded in transcending my past and finessing my originality so that it doesn't kill me? The innate genetic temperament of cheerfulness has been decisive: to look at this world not only with contempt but also amused condescension, understanding that the slings and arrows of outrageous fortune mean nothing because nothing, in a sense, means anything. My genes and my understanding have given me whatever contentment I have.

But also, the emotional maturity has come with a little help from my friend, Chomsky. He helped teach me that 'tis nobler in the mind to suffer fortune *quietly* than to moan about it. Not to fixate on the self, not to draw unseemly attention to the self, but to raise oneself above particularity and into universality. That is nobility, that averting one's gaze from oneself so that one becomes humanity. And if one's contemporaries almost to a man are disappointing, one simply withdraws into the universal. That is the cure.

*

The stupidity of policymakers is striking. Assuming they do want to stimulate economic growth -- an assumption that is by no means unproblematic -- their prescription of fiscal austerity is self-evidently counterproductive. Look at how well it succeeded when Herbert Hoover tried it, and when Franklin Roosevelt returned to austerity in 1937-38, thus triggering another major recession. A schoolchild could

¹ I don't mean *all* leftists.

see that what's necessary is massive government spending, not cuts. But corporations hold the power, and corporations want cuts, so cuts it will be.

The silver lining is that spending cuts will intensify social and political conflict, class polarization, in the end hastening the demise of our overripe civilization.

*

It's hard to imagine that in the next ten or twenty years there won't be a major uprising, or a series of major uprisings, in the U.S. What *is* hard to imagine is where these uprisings will lead. I have *no idea*.

*

I can't help repeating the obvious: I'm thrilled that the age of "post-materialist" activism is coming to an end. Finally! All those elite postmodernist fools in the 1970s, '80s, '90s, and 2000s proclaiming smugly that the age of materialism, of class struggle, of economic activism was over....precisely when the ground was just beginning to cave in beneath the feet of the middle class and, much more so, the lower classes! In fact, the reason it was even possible to be fooled into the postmodernist, post-materialist creed was precisely the *intensification* of class war on the part of corporations! With the help of government they broke the precarious postwar "capital-labor accord" (not an "accord" at all, really), smashed the labor movement, and so deprived labor of an effective voice in the political arena. But the crumbling of effectual class struggle on the weaker side coincided with, and was made possible by, the triumph of class war on the stronger side. Any idiot could have seen this. And any idiot could have seen that such trends couldn't persist indefinitely, that a climax would eventually have to come to the "rich-getting-richer, poor-getting-poorer" dynamic. A day of reckoning would come sooner or later. Feminism, multiculturalism, and gay-rights activism -- *cultural* egalitarianism, in short -- could make headway because they didn't challenge the class structure (and because they had *money* behind them). As I've said before, then, the rise of postmodernism, far from invalidating materialism, Marxism, etc., was made possible by institutional facts that only a Marxian or "economistic" analysis can explain. Postmodernism was the quintessential symptom and proof of what it denied, thus refuting itself, so to speak. Its mere existence and popularity refuted it (because, institutionally speaking, *what was required* for it to become the hegemonic discourse?).

Post-materialist activism is important, but not nearly as important as economic activism. It's a matter of privileges versus survival.

*

I've discussed this topic a lot already, but here I go again: how do you explain the pleasure of thinking about unpleasant things? For ten minutes today I thought about that stupid incident in college when I went home after a date with the girl who was fumbling for her key and was probably about to let me in to have some fun with her. While reliving the moment I thought, 'Why am I thinking about this? It's painful. Stop thinking about it.' But I answered, 'No, I'm not finished yet,' and kept myself stewing in the relived sexual frustration. What's going on there? I think I answered the question a while ago, but here it is again: my purpose in continuing to think about it is to get myself to *accept* it, to experience the pain in order to rise above it and realize its unimportance. I want to "*assimilate*" the foreign, unassimilated experience, grasp it in its phenomenological essence and so deal with it, triumph over it, conquer its pain. And in fact, after a few minutes I attained a moment of clarity in which I (*intuitively*) understood the silliness and transience of the painful episode, at which point I thought, 'Okay, good. On to something else.'

These sorts of paradoxical things aren't true only of me; they're true of everyone. Due to my sensitive, introspective nature, though, I experience them more intensely than others.

*

On leadership, again.-- One of the reasons I don't respect "leaders" very much is that they're usually just as obedient and conformist as everyone else, in some respects maybe more so. For they rise to leadership positions by being good at following institutional norms and acting as people want and expect them to act. They accept the rules -- the *bullshit* -- of the game. In most cases they also necessarily have moral failings, such as dishonesty, hypocrisy, ruthlessness, selfishness, narcissism, a tendency to be rude and overbearing, and an unprincipled, authoritarian love of power. I might almost say they tend to exemplify the ethically dubious and inhumane.

Moreover, "leadership" is at best in uneasy tension with democracy. The *people* should lead, not an individual or individuals. "Communicative rationality," which is really what democracy is, is not readily compatible with the existence of dominating personalities who monopolize the conversation or guide it where they want it to go, using their emotional-charismatic powers of "*persuasion*"¹ -- not to mention other more underhanded tactics that political and economic leaders often use -- to manipulate outcomes. Reason is democratic (because quintessentially free, under one's control, and, in principle, universally accessible); charisma and all things un-rational are authoritarian, vis-à-vis either oneself or others. (They *compel*.)

Doubtless humans and societies are saturated with the un-rational, but to that extent democracy is imperfect. Both a person's "democratic" ("autonomous") control over himself and a society's purely democratic control over itself are impossible. But these ideals can be approached more or less closely. And with regard to a society, the more that the "leadership" principle predominates, the less democratic it is.

Incidentally, one might argue that it's largely or entirely the feminine element in people that makes them susceptible to being led. Women, especially the more feminine ones, tend to be more smitten by charisma than men, yielding to it readily, sometimes *fainting* from contact with it or its trappings (as, for instance, Elvis made young women faint). In this respect, femininity is in tension with true democracy, true communicative rationality. [I've deleted a long discussion I had here of democracy as it relates to femininity on the one hand and masculinity on the other.]

*

D. W. Winnicott notwithstanding -- and despite everything I wrote above -- I'm still not sure it makes a lot of sense to abstract out idealized feminine and masculine elements from each personality. Is it possible to assign different abstract traits to each? [...]

*

From a recent Chomsky article on the global economy: "...The developing picture is aptly described in a brochure for investors produced by banking giant Citigroup. The bank's analysts describe a global society that is dividing into two blocs: the plutonomy and the rest. In such a world, growth is powered by the wealthy few, and largely consumed by them. Then there are the 'non-rich,' the vast majority, now sometimes called the global precariat, the workforce living a precarious existence...." Yup. The concept of the precariat is in some respects the successor to that of the proletariat. Every year the world gets closer to Marx's abstract ideal of polarization between the rich and the poor, with the middle class dissolving away like a memory. *Finally* the age of revolution is approaching!!

--The revolutions of the 19th and 20th centuries, from feudalism to capitalism (of various kinds²), will probably seem minor in comparison to the chaos that we're in for.

¹ Some classical writers, such as Plato, made a distinction between reason and the coercion implicit in some kinds of speech (eloquent speech). It's the difference between being rationally convinced and being emotionally "persuaded." If I remember right, Rousseau also touches on this.

² Some kinds were not very "capitalist" at all if that denotes a market economy. The classic examples are the USSR and China. But, again, no societies had purely market economies; all were planned, *state*-planned, to some degree. It was a continuum, not a dichotomy, between market and non-market economies. The real source of conflict between, say, the USSR and the U.S. was simply, e.g., that the former wouldn't let the latter's investors have access to its

*

August

I asked Chomsky about his thoughts on the synthetic a priori, and also on Quine's paper on the analytic-synthetic distinction. His response:

I haven't written about it. I've written quite a lot on Quine, but not on that particular paper, which I think misinterpreted Carnap, and really doesn't bear on the questions of the synthetic a priori. [True.]

In formal systems there is a stipulated analytic-synthetic distinction. For ordinary language it is not possible to pose the questions precisely because the concepts involved are not precisely enough defined.

Interesting viewpoint. But isn't it somewhat similar to what Quine argued?

[...] I'm reading Harry Braverman's classic *Labor and Monopoly Capital: The Degradation of Work in the Twentieth Century* (1974), which is "an attempt to inquire systematically into the consequences which the particular kinds of technological change characteristic of the monopoly capitalist period have had for the nature of work and the composition (and differentiation) of the working class." It's a thoroughly Marxist book.

Long discussion of Taylor and scientific management. Insistence that the latter, interpreted broadly, is of essential importance to labor processes in mature capitalism. (Management taking knowledge of technical processes away from skilled workers and forcing them (over decades) to be dumbed down, to be mere instruments that have little or no understanding of how all the work they do in factories "fits together." Management becomes the brain, whereas formerly the skilled workers were both the brains and the brawn. "Conception is separated from execution," which in the 1870s, '80s, and even afterwards was not the case. Hence the thickening of management, the addition of many layers of bureaucracy for the sake of planning and supervising.) The absurd extremes of the dehumanization of industrial labor under the impetus of the "scientific-technical" revolution in the late 19th and early 20th centuries.

And machinery. Oh, the machinery! "The capacity of humans to control the labor process through machinery is seized upon by management from the beginning of capitalism as the *prime means whereby production may be controlled not by the direct producer but by the owners and representatives of capital*. Thus, in addition to its technical function of increasing the productivity of labor -- which would be a mark of machinery under any social system -- machinery also has in the capitalist system the function of divesting the mass of workers of their control over their own labor." (Italics in the original.) Braverman gives myriad examples.

"Machinery offers to management the opportunity to do by wholly mechanical means that which it had previously attempted to do by organizational and disciplinary means. The fact that many machines may be paced and controlled according to centralized decisions, and that these controls may thus be in the hands

resources. It refused to be subservient to Western business interests. There was the ideological war, yes, and (more importantly) there was "the threat of a good example" -- the possibility of other countries following the lead of Russia into a more state-directed and unsubservient-to-the-West economy -- but fundamentally it was just a matter of "You're not letting us control you!" and "You're not letting us get rich off you!" The rhetoric of capitalism vs. socialism was a smokescreen. The real issue had to do with Russia's appalling principle of national independence, and also -- less so -- with the confrontation between two very different kinds of (basically) state-capitalist social relations, one of which was much more friendly to private investors than the other.

of management, removed from the site of production to the office -- these technical possibilities are of just as great interest to management as the fact that the machine multiplies the productivity of labor.”

The capitalist drive to increase labor productivity can become socially irrational in its unstoppable frenzy. In the obsession with cutting labor costs, more and more people are eventually thrown out of work; more and more people lose their source of income and become economically redundant. Machines take the place of workers. As a result, aggregate demand falls, which causes a fall in capacity utilization, which causes a fall in investment, which further decreases aggregate demand, etc., until eventually a recession or depression hits. Since profitability is the goal, the only cure that units of capital know to all this is to keep cutting labor costs and in the long run keep increasing productivity -- which exacerbates the systemic problems and keeps the vicious cycle going. In the long run, governments, too, aid capital in cutting labor costs and financing improvements in productivity.

--“Each capitalist nation will further degrade its own working population and social life in an attempt to save a social system which, like the very planets in their orbits, will fall to its destruction if it slows in its velocity. Here we have the *reductio ad absurdum* of capitalist efficiency, and the expression in concrete terms of the insoluble contradiction that exists between the development of the means of production [or the productive forces] and the social relations of production that characterize capitalism.” The development of the forces of production in the long run tends to undermine the social relations of production, by causing (indirectly) economic crises and long-term stagnation. (The latter, too, tends to obstruct further growth of the productive forces (by discouraging investment) -- though not to the point of stopping such growth altogether.)

Braverman’s discussion of the modern corporation nicely demonstrates the insane complexity of corporate structures. For example,

....Thus marketing became the second major subdivision of the corporation, subdivided in its turn among sales, advertising, promotion, correspondence, orders, commissions, sales analysis, and other such sections. At the same time, other functions of management were separated out to form entire divisions. Finance, for example, although not as a rule large in size, became the brain center of the entire organism, because here was centralized the function of watching over capital, of checking and controlling the progress of its enlargement; for this purpose, the finance division has its own subdivisions for borrowing, extending credit, collections, supervising cash flow, stockholder relations, and overall supervision of the financial conditions of the corporation. And so on, throughout the various functions and activities of the corporation, including construction and real estate, legal, public relations, personnel and labor relations, etc.

Each of these corporate subdivisions also requires, for its own smooth functioning, internal departments which reflect and imitate the subdivisions of the entire corporation. Each requires its own accounting section, ranging from the complex cost accounting of the manufacturing divisions to the simpler budgeting functions required of even the smallest divisions. Each often controls its own hiring through its own personnel department; many require separate maintenance and cleaning sections, as well as traffic and routing, office management, purchasing, planning correspondence, and so forth. Thus each corporate division takes on the characteristics of a separate enterprise, with its own management staff.

The picture is rendered still more complex by the tendency of the modern corporation to integrate, vertically as well as horizontally. Thus, by growth and by combination, the manufacturing corporation acquires facilities for the production of raw materials, for transportation, semi-banking institutions for the raising of capital or extending of credit, etc....

And people deny that economic institutions (in their interrelations) are the central determinants of social dynamics!

The overall purpose of administrative controls is to reduce uncertainty and contingency with regard to the basic goal of making profit and accumulating capital. "Since markets must remain the prime area of uncertainty, the effort of the corporation is therefore to reduce the *autonomous character* of the demand for its products and to increase its *induced* character. For this purpose, the marketing organization becomes second in size only to the production organization in manufacturing corporations, and other types of corporations come into existence whose entire purpose and activity is marketing." All the mainstream fetishism of "free markets" is, therefore, sheer intellectual fraud. Corporations want to *control* markets, not to let them be "free."

Needless to say, just as production jobs have become more and more degraded in skill and intellectual stimulation as mechanization has proceeded and the division of labor has become more minute, so the whole world of management (not just "managers," and not the upper ranks) has become characterized by degraded, semi-skilled clerical work, increasing mechanization, and a minute division of labor. Antagonistic class relations are reproduced in the ranks of "management" itself.

Braverman's discussion of the nature and history of clerical work, how it has grown incalculably since the 19th century and lost status and pay in the process, is excellent. In the early 20th century it, too, was subject to discipline of scientific management. And then mechanization, etc. For all intents and purposes, clerical work ceased to be "mental" and became "manual." A nearly unthinking repetition of simple operations. (Manual labor, too, had once been quite "mental," requiring great intelligence and understanding, but gradually was reduced in skill level.)

And then there are the service and retail occupations.

The reasons for the rapid growth of service occupations in both the corporate and governmental sectors of the economy [are as follows]: the completion by capital of the conquest of goods-producing activities; the displacement of labor from those industries, corresponding to the accumulation of capital in them, and the juncture of these reserves of labor and capital on the ground of new industries; and the inexorable growth of service needs as the new shape of society destroys the older forms of social, community, and family cooperation and self-aid....

As labor is displaced from manufacturing, which is more easily unionized than clerical, service, and retail labor, and so tends to have (after unionization has happened) higher rates of pay, society's aggregate demand starts to decrease because of the lower pay rates in non-manufacturing sectors.¹ In order to keep the economy going strong, consumer credit becomes increasingly important. As it has been from the 1970s on.

"The paradox that the most rapidly growing mass occupations in an era of scientific-technical revolution [as from the late 19th century] are those which have least to do with science and technology [-- such as service, retail, clerical, etc., areas that tend to be less mechanized than manufacturing --] need not surprise us. The purpose of machinery is not to increase but to decrease the number of workers attached to it. Thus it is by no means illogical that with the development of science and technology, the numbers of those cheaply available for dancing attendance upon capital in all of its *least* mechanized functional forms continue to increase at a rapid pace."

Based on extensive statistics and calculations, Braverman concludes persuasively that in the early 1970s, two-thirds to three-fourths of the total population (or working population?) appeared "readily to conform to the dispossessed condition of a proletariat." This category excludes, of course, "the engineering, technical, and scientific cadre, the lower ranks of supervision and management, the considerable numbers of specialized and 'professional' employees occupied in marketing, financial and organization administration, and the like, as well as, outside of capitalist industry proper, in hospitals, schools, government administration, and so forth." According to Braverman, these categories embrace (or

¹ Before mass industrial unionism, too, severe recessions and depressions were more frequent than in the era of unionism, probably in part because of insufficient aggregate demand.

embraced) “perhaps over 15 but less than 20 percent of total employment.” *Formally* they have the same proletarian condition as the others just mentioned....but increasingly these days, even *substantively* they have a similar position. More and more every year, as Marx predicted, the economy is being polarized into a tremendous majority of the dispossessed and a tiny minority of the possessors.

In the last chapter, Braverman demolishes the myth that most work tended to become *more* skilled during the 20th century by considering mainstream writers’ arguments on their merits (or lack of them). For example, most people in the West associated “white-collar” occupations with skill and “blue-collar” occupations with a lack of it, so that the rise of the former and decline of the latter was seen as proof that skill levels were rising. But we’ve already dispatched the myth that clerical, service, sales, and retail work is usually “skilled.” In fact it’s far less skilled than the work of the old craftsmen and even their semi-skilled assistants, and also the work of farmers and often their helpers (the number of (both of) whom declined sharply in the 20th century), who had to master “a great many skills involving a knowledge of land, fertilizer, animals, tools, farm machinery, construction skills, etc., and the traditional abilities and dexterities in the handling of farm tasks.” (Plowing, milking, caring for animals, harvesting, mending fences, etc.)

Interesting aside: “That self-evident, conventional wisdom can vary with time, place, and social circumstances was strikingly displayed by Jerome Davis in a study he made of the social attitudes of Soviet schoolchildren in the mid-twenties. In rating a list of occupations adapted from one of the common U.S. ‘prestige’ scales, these children reversed the order of rank found in the use of the scale in the United States, putting farmers first and bankers last.” A good case can be made that the children were right.

But what about the fact that the length of the average period a person spent in school before getting a job increased in the 20th century? Doesn’t this indicate that the skill levels of jobs increased? No. First of all, basic literacy and familiarity with mathematics has become more important just for getting around in society. Second, the provision of *socialization* has been increasingly taken over by schools (whereas it used to be done by farm, family, community, and church). So basic education has had to be prolonged. Third, in the late 1930s legislation was passed “restricting the labor-force participation of youths, the object of which was to reduce unemployment by eliminating a segment of the population from the job market. The anticipated consequence of this was the postponement of the school-leaving age.” Later, after the post-World War II surge of school- and college-enrollment (a result of government programs designed partly to reduce unemployment), there began to be an *over*-supply of educated people by the end of the 1960s. Millions of these people ended up being overqualified for their jobs.

At the same time, the expanded education sector furnishes jobs for millions of teachers, administrators, construction workers, etc., thus providing a huge boon to the economy.

Braverman gives many more compelling arguments, but that’s enough. In any case, by 2011 the main conclusions of his book have become common sense.

Reading the second half of Paul Krugman’s textbook on international economics. Notes.-- A rise in the interest rate causes the aggregate demand for money to fall, because people have more incentive to invest their money in illiquid, interest-bearing assets.

“The market always moves toward an interest rate at which the real money supply equals aggregate real money demand. If there is initially an excess supply of money, the interest rate falls, and if there is initially an excess demand, it rises.” So, if people want to get rid of some of their money because the interest rate is high (and they want to take advantage of that), they’ll try to buy interest-bearing assets. In other words, they’ll try to lend their money to others. But not everyone will succeed: more people want to lend than borrow. So the potential lenders will try to tempt borrowers by lowering the interest rate they charge. This process will tend to go on until the excess supply of money has disappeared, so that money supply equals money demand.

Thus, “an increase in the money supply lowers the interest rate, while a fall in the money supply raises the interest rate, given the price level and output.”

On the other hand, “an increase in real output raises the interest rate, while a fall in real output lowers the interest rate, given the price level and the money supply.” That’s pretty intuitive. If the

economy's output grows, the demand for money is going to increase. Assuming that the money supply is given, however, interest rates will be bid up by borrowers.

The relation between the interest rate and the exchange rate is fairly straightforward if you disregard considerations having to do with the *expected future* exchange rate. (More on that later.) *Ceteris paribus*, an increase in the interest paid on deposits of a currency causes that currency to appreciate against foreign currencies, because investors' demand for the currency increases. They want to get hold of that currency in order to lend it and thus realize relatively high returns.

I'm tired of that book, and the semester is starting anyway, so I have to read other stuff. Here are some of the books I'm reading or half-reading for courses this fall:¹ Margaret C. Jacob, *The Enlightenment: A Brief History with Documents* (2001); half of François Furet, *Revolutionary France, 1770-1880* (1995); Jonathan Sperber, *The European Revolutions, 1848-1851* (2005); Timothy Snyder, *Bloodlands: Europe between Hitler and Stalin* (2010); Joan W. Scott, *Only Paradoxes to Offer: French Feminists and the Rights of Man* (1996); Brian Porter, *When Nationalism Began to Hate* (2006); Cooper and Stoler, eds., *Tensions of Empire: Colonial Cultures in a Bourgeois World* (1997); Jay Winter, *Sites of Memory, Sites of Mourning: The Great War in European Cultural History* (2005); Orlando Figes, *A People's Tragedy: The Russian Revolution, 1891-1924* (1996); Robert Paxton, *The Anatomy of Fascism* (1995); Doris Bergen, *War and Genocide: A Concise History of the Holocaust* (2003); half of Tony Judt, *Postwar: A History of Europe Since 1945* (2005). Also reading Jonathan Daly's large book *Revolutionary Civilization: Explaining Western Power in the Modern World* (2011) for the class I'm TAing (taught by Daly).

Margaret Jacob's selections from Locke's *Thoughts Concerning Education* make it clear that all the obsessive writing in the past century about how to raise children has been largely unnecessary. Locke's thoughts are, on the whole, sufficient. Raising a child is mostly a matter of common sense anyway; but since most people lack common sense, they should read Locke's advice. Almost all of it is fantastic. A truly humane and wise man, Locke was.

Let's try out a few ideas on the Enlightenment. What caused it? What was its meaning? This founding "event" of the modern world: how should we interpret it? I see it as sort of a continuation -- in some respects -- of the Renaissance and the Reformation: a reaction against hierarchy, authoritarianism, the dead weight of tradition, the submersion of the individual in the disfranchised mass -- a fundamentally anti-feudal phenomenon, as I think the other two events were. Society was becoming more individualized and, so to speak, atomized (a process that has continued to this day); self-consciousness was being progressively sharpened. Over centuries, people were becoming more aware of themselves as individuals (in opposition to institutional hierarchies), as well as of their society vis-à-vis others. Doubtless the Renaissance and Reformation were opposed in many respects, but they were both basically expressions of the "individuality" principle. As was the Enlightenment, with its emphasis on reason, republicanism, rights, democracy, opposition to illegitimate authority, etc. That's what the modern age, from the 1400s or so, is all about: the slow progress of self-consciousness, individuation, historical consciousness, differentiation between self and other (and ultimately, therefore, between the self and itself). [Of course our age is "about" other things too, but you know what I meant.]

As for what *caused* the Enlightenment, Jacob spells it out succinctly. Obviously England's scientific revolution of the 17th century did much to inspire thinkers on the Continent (and in England itself) -- Isaac Newton was worshiped by all enlightened thinkers, and the spirit of empiricism undermined Catholicism. But there were also political origins. "The political roots of the European Enlightenment grew out of a profound revulsion against new political abuses that arose in the 1680s on both sides of the English Channel. Two nearly simultaneous events precipitated the crisis: In 1685, the English Catholic James II came to the throne, and in France Louis XIV revoked the limited toleration that French Protestants, known as Huguenots, had enjoyed for nearly a hundred years." That is, he tore up the Edict of Nantes. As a result, many Protestants fled to Geneva, Berlin, the Dutch republic, England, and America, making connections

¹ There aren't many because I'm only taking two classes, and one is a research seminar for which I'll choose most of my own books.

with each other. Opposition movements to Catholic authoritarianism developed in both England and (more secretly) France. By means of printing presses, an international propaganda campaign amongst diverse Protestants and deists sprang up. James II was overthrown, a revolution that had positive repercussions for civil liberties in Britain and initiated a period of intellectual and cultural ferment. Intellectuals on the Continent were stimulated by developments in England, establishing, for example, secret Masonic lodges (which originated in England) where secular, oppositional ideas could be promulgated and discussed in safety. A "public sphere" began to emerge. Things took off from there.

I won't discuss economic factors, but you can imagine what they were.
Sent Chomsky another email:

Professor Chomsky,

You probably hear this sort of thing all the time, but I just wanted to let you know....you have helped me become, in a sense, my "better self." Intellectually speaking, at least. Helped clear my logical vision -- I've loved Marx since I was a teenager, but you helped modernize and 'rigorize' the philosophy for me -- and also morally speaking, you're a "hero of Homeric proportions," as someone once said.

Possibly the only criticism I have is that I wish you would give more concrete advice to activists, even though I understand your reasons for not doing so. The sort of people you talk to, I think, already know that the world is in a lot of trouble, that the system is in crisis, and that corporations are responsible for most of the world's ills. You could, for example, slip into your talks suggestions on good sources of information (e.g., *ZMag*, *Dollars & Sense*, etc.; not everyone knows about these things), and spend more time talking about recent concrete advances that have been made (e.g., the manufacturing cooperatives being built by the USW and Mondragon in North America). You seem to focus on the negative. Why not spend more of your time talking about the positive?

It's interesting: you're incredibly specific and concrete about the crimes of the elite that are always going on, but you become a little more vague and less detailed -- and more brief -- when talking about *good* things that are happening at this moment. I've watched a number of interviews and talks, and that's the impression I have. Maybe you could talk more about the sorts of things that are showcased on [various blogs].

Incidentally, I've never fully understood your aversion to giving advice. As someone who has thought deeply about all the serious issues in the world, surely you have the right to give advice. And people have the right to reject it -- but the point is that at least they'd be hearing a different perspective that they could take into account when formulating their plans of action. Advice isn't necessarily presumptuous; it's just input. And input is always worthwhile, because it's *dialogue*.

Anyway, as I once heard an interviewer say to you, "I love you!" You're a true hero -- intellectually, politically, and morally.

His response:

Thanks for your thoughts. I've occasionally heard similar suggestions, but in fact, very rarely. They're overwhelmed by other requests: for facts, interpretation, analysis. It's true that plenty of people think that corporations cause endless problems, probably a large majority of the country. But in my experience at least, very few know how or why.

I very rarely pick the topic of the myriad talks, discussions, interviews, etc. And bear in mind that these are not generally activist audiences, though the initiators quite often are engaged in particular issues. I try to do what I'm asked to do. Few seem to want to hear what you suggest, though if I were asked to talk about these topics, or even if they came up in Q&A, I'd be glad to do so. In fact, there isn't a great deal to say. It would be instructive to discuss carefully the successes and serious failings of Mondragon, but I'm never asked. When I'm asked (rarely) about cooperatives, the best I can think of doing is to refer to Alperovitz's useful reviews. Participatory budgeting is a good idea too. I've occasionally referred to it, but it doesn't seem to respond to audience interests.

On giving advice, I'm not reluctant if people ask about a particular topic: what can we do about the alleged fiscal crisis? The Iraq war? Iran's nuclear weapons? Global warming?... etc. But what stymies me, frankly, is the great many requests for general advice: what should I do with my life? How can we bring about radical social change? Things like that. There are many young people who want simple formulas, but there aren't any. You don't find them in the traditional radical literature either.

I have some reservations about citing sources too. If people ask me what to read about the economy, I do list specific journals and individuals, like *Dollars & Sense*. But I also think one should read widely, not just what reinforces our own beliefs. One can learn a great deal from the business press, for example.

I appreciate your suggestions. It's not really clear to me how to respond to them.

Actually, that's a better response than I'd expected.

Here's a good article from *Al Jazeera* on the supposed possibility of capitalism's demise:

The massive volatility and sharp equity-price correction now hitting global financial markets signal that most advanced economies are on the brink of a double-dip recession. A financial and economic crisis caused by too much private-sector debt and leverage led to a massive re-leveraging of the public sector in order to prevent Great Depression 2.0. But the subsequent recovery has been anaemic and sub-par in most advanced economies given painful deleveraging. [...]

So Karl Marx, it seems, was partly right in arguing that globalisation, financial intermediation run amok, and redistribution of income and wealth from labour to capital could lead capitalism to self-destruct (though his view that socialism would be better has proven wrong). Firms are cutting jobs because there is not enough final demand. But cutting jobs reduces labour income, increases inequality and reduces final demand.

Recent popular demonstrations, from the Middle East to Israel to the UK, and rising popular anger in China - and soon enough in other advanced economies and emerging markets - are all driven by the same issues and tensions: growing inequality, poverty, unemployment, and hopelessness. Even the world's middle classes are feeling the squeeze of falling incomes and opportunities. [...]

--It's beautiful. The beautiful Marxian logic. Only 130 years later than Marx thought.¹

I had an interesting experience today. But I don't feel like going into detail about it. I'll just say that yesterday I met a pretty Chinese woman (34) at an event at an art gallery. Some of her art was on display: very impressive paintings. She came to Chicago a couple years ago to get an MBA (at Loyola) to

¹ In my Master's thesis I picked up where he left off, making the necessary revisions to his system.

help her in her social justice work, her fighting on behalf of migrant workers in China. Used to work for Oxfam. She invited me to accompany her today to the Art Institute; we had a good time critiquing paintings. I also learned that she's been married twice and has a nine-year-old daughter who went to a foster home a few days ago because Zhilan's current husband was recently arrested for beating her and her daughter in public. He has also threatened to kill them and invite Zhilan's father to come to Chicago to pick up her body. So, not an awesome guy. A few days ago he disappeared; Zhilan doesn't know where he is.

[...]

She's an intriguing woman. Emotional, eager for affection, relatively friendless, immature in some respects but intelligent, artistically talented, politically dedicated, ambitious, good-humored, and responsible enough to have raised a daughter. It probably isn't wise of me to get involved with her...but she likes me and could use a good man in her life. (I advised her to get a divorce from the vile husband.)

September

Is it possible that the West's current obsession with fiscal austerity will end in the next few years, as governments see what damage it's doing? Will there be a return to economic stimulus and an increase of social spending? Doesn't seem likely. It isn't in the interest of the financial sector and corporate power-structures in general. But depression isn't in their interest either. *Stagnation*, within reason, isn't so bad, but *depression* is. Is it possible that in the context of a global (proto-)depression there would be moves toward a sort of global New Deal? How could such a plan possibly be agreed upon by everyone? -- and then administered?! There are too many different power-structures with different interests. Too many countries, too many economic zones, too many ways for corporations to subvert the rules. If the global regime were going to be at all effective, it would have to change capitalism so much that corporations as we know them would effectively cease to exist. But they won't let that happen. Not until a *major, prolonged* depression occurs. And by then, a new system will be emerging from the ground up.

I don't see anything but systemic chaos in the future.

...Zhilan is a very passionate kisser. Also a very good person. She's had quite a life. She's been a reporter etc., and she visited garment factories when she was with Oxfam and couldn't handle seeing the terrible treatment of the workers and so doesn't want to go back to China, only wants to use her MBA to write articles for China's labor movement etc. Also has a Master's in Education and occasionally writes columns for Chinese business publications. Was the valedictorian of her high school class and the director of a large chorus (in college too) -- also the main soloist -- and the radio broadcaster for her school. Wants her daughter to be a lawyer so she can do effective work on behalf of the oppressed. For the next four months will be living with her daughter in a shelter for battered women, apparently a great place with lots of children and young mothers. --Women are certainly, in some respects, stronger than men. No question. They can stay positive and seemingly young at heart despite all their suffering.

...Went to Navy Pier with Zhilan and her daughter Suzy (Lulu), an intelligent, vivacious, adorable girl. And her mom is definitely a "milf." But also someone I'm emotionally attracted to. She sent me this message on Facebook: "By the way. You have been so elegantly created, and being around of you is just a joy." I too am pretty happy around her.

Another nice email: "Hi your message is pretty much make the day *sunny*! Lulu began to like you, she likes you handsome, humble, and caring of her. Just let you know I am very happy. Oh! What a long week, what a sweet waiting!" Lovely girl.

[...]

Here are some excerpts from a review article of a book I'm about to read [for an academic paper I had to write] called *Slaughterhouse* (1997), by Gail Eisnitz.

...The agony starts when the animals are hauled over long distances under extreme crowding and harsh temperatures. Here is an account from a worker assigned to unloading

pigs: "In the winter, some hogs come in all froze to the sides of the trucks. They tie a chain around them and jerk them off the walls of the truck, leave a chunk of hide and flesh behind. They might have a little bit of life left in them, but workers just throw them on the piles of dead ones. They'll die sooner or later."

Once at the slaughterhouse, some animals are too injured to walk and others simply refuse to go quietly to their deaths. This is how the workers deal with it: "The preferred method of handling a cripple is to beat him to death with a lead pipe before he gets into the chute... If you get a hog in a chute that's had the shit prodded out of him, and has a heart attack or refuses to move, you take a meat hook and hook it into his bunghole (anus)...and a lot of times the meat hook rips out of the bunghole. I've seen thighs completely ripped open. I've also seen intestines come out."

And here is what awaits the animals on the kill floor. First, the testimony of a horse slaughterhouse worker: "You move so fast you don't have time to wait till a horse bleeds out. You skin him as he bleeds. Sometimes a horse's nose is down in the blood, blowing bubbles, and he suffocates."

Then another worker, on cow slaughter: "A lot of times the skinner finds a cow is still conscious when he slices the side of its head and it starts kicking wildly. If that happens, ... the skinner shoves a knife into the back of its head to cut the spinal cord." (This paralyzes the animal, but doesn't stop the pain of being skinned alive.) And still another, on calf slaughter: "To get done with them faster, we'd put eight or nine of them in the knocking box at a time... You start shooting, the calves are jumping, they're all piling up on top of each other. You don't know which ones got shot and which didn't... They're hung anyway, and down the line they go, wriggling and yelling" (to be slaughtered while fully conscious).

And on pig slaughter: "If the hog is conscious, ... it takes a long time for him to bleed out. These hogs get up to the scalding tank, hit the water, and start kicking and screaming... There's a rotating arm that pushes them under. No chance for them to get out. I am not sure if they burn to death before they drown, but it takes them a couple of minutes to stop thrashing."

The work takes a major emotional toll on the workers. Here's one worker's account: "I've taken out my job pressure and frustration on the animals, on my wife, ... and on myself, with heavy drinking." Then it gets a lot worse: "... with an animal who pisses you off, you don't just kill it. You ... blow the windpipe, make it drown in its own blood, split its nose... I would cut its eye out... and this hog would just scream. One time I ... sliced off the end of a hog's nose. The hog went crazy, so I took a handful of salt brine and ground it into his nose. Now that hog really went nuts..."

Safety is a major problem for workers who operate sharp instruments standing on a floor slippery with blood and gore, surrounded by conscious animals kicking for their lives, and pressed by a speeding slaughter line. Indeed, 36 percent incur serious injuries, making their work the most hazardous in America. Workers who are disabled and those who complain about working conditions are fired and frequently replaced by undocumented aliens. A few years ago, 25 workers were burned to death in a chicken slaughterhouse fire in Hamlet, NC, because management had locked the safety doors to prevent theft.

Here is a worker's account: "The conditions are very dangerous, and workers aren't well trained for the machinery. One machine has a whirring blade that catches people in it. Workers lose fingers. One woman's breast got caught in it and was torn off. Another's shirt got caught and her face was dragged into it."...

The author of the review compares these plants to Auschwitz. Extermination camps for animals. (Actually, insofar as the "guards" are miserable too, they're worse than Auschwitz.)

It's a very readable book, albeit disturbing. For example, "I glanced through the pile of complaints on my desk.... A guy in North Carolina strangled a hundred puppies for fun; a New Yorker collected two hundred homeless pets and then starved them to death. Just when I thought I'd seen it all, some new way to torture animals would land in my in-box...." But more disturbing than the random crazy people is the institutionalized craziness, the institutionalized sadism. (That's really what capitalism is, after all.) The way workers deal with killing and torturing thousands of beings a day is, not surprisingly, through drink. And taking out their frustrations on friends and family.

"....A live hog would be running around the pit. It would just be looking up at me and I'd be sticking [i.e., cutting throats], and I would just take my knife and cut its eye out while it was just sitting there. And this hog would just scream." This guy was known in the plant for sucking on eyeballs as a joke. Another guy drank a cup of blood. "You develop a bizarre sense of humor down there."

"....I've drug cows till their bones start breaking, while they were still alive. Bringing them around the corner and they get stuck up in the doorway, just pull them till their hide be ripped, till the blood just drip on the steel and concrete. Breaking their legs pulling them in. And the cow be crying with its tongue stuck out. They pull him till his neck just pop."

Aside from the corporations, the fault lies mainly with the USDA, which has abdicated its regulatory role. It simply doesn't enforce laws like the Humane Slaughter Act. Meat inspectors who try to enforce this particular law are *punished* by their superiors, for a variety of bureaucratic reasons. The systemic corruption that Eisnitz unearths is stunning.

It's ironic that the federal government is the Number 1 violator of its own laws (by not enforcing them).

I'm reading a bunch of other books too, of course. E.g., Donald Stull and Michael Broadway's *Slaughterhouse Blues: The Meat and Poultry Industry in North America* (2004). And too many others to list.

An email I sent to [a friend], my intellectual companion, which partially repeats stuff I've written before:

No, obviously I don't think you're off base. Anyone with common sense -- in fact, the large majority of the population -- would agree that business interests are ultimately what propel most U.S. foreign and domestic policy. It's only in the hallowed groves of academe that people delude themselves into thinking that idealistic motives are the basic determinant of....everything. [...]

In general, I think my primary *bête noire* is institutions themselves. Outside of institutions, I like people. In their capacity as bearers of institutional roles, I tend to dislike them (for their lack of independent thought, their inhumanity, etc.). [...] For these people, actually, it's the *physical location* that matters most. In an office building or an academic setting you have to *follow the rules* (understandably); outside, you can be a human being. This is the sort of thinking [or rather *acting*] that leads to Robert McNamara's inhumanity and ultimately Adolf Eichmann's "banal evil." Institutional thinking. That's been the main evil throughout history. [...] These people, insofar as they're personifications of institutions, are not different *in kind* from Eichmann, only different in degree and in institutional setting.

Anyway, I applaud your ongoing attempts to enlighten "the herd of independent minds" (to quote Chomsky quoting somebody, referring to intellectuals). And sorry for the vehemence of this email; I've been drinking.

And here's something I posted on Facebook in answer to a question a friend had posed.

These are obviously important questions. An excellent book to start with is Erik Olin Wright's *Classes*, from 1985 or so. He's a rigorous thinker, a respected Marxist sociologist.

As I see it, one's position in the "relations of production" is the main determinant of one's access to resources, hence of one's experiences, hence of one's consciousness. Even if in our postmodern times class is no longer one of the primary ways in which people identify themselves, it arguably remains the most important factor in explaining social dynamics and, ultimately, people's consciousness (belief-systems, behavior, etc.). In fact, on one level, "materialism" is just common sense. People and institutions need resources to get anything done, and economic position is ultimately what determines access to resources. Corporate power-structures, which occupy the capital-owning class-position in productive relations, have more resources than ordinary people, so their agenda dominates politics and the media -- so much so that they can manipulate people into voting against their own economic interests. I don't see how anyone can doubt that "The ideas of the ruling class are in every epoch the ruling ideas" -- although that formulation has to be qualified, since the world is complicated. Nevertheless, it is broadly true, as a glance at the New York Times can establish. Why, for instance, was postmodernism, identity politics, etc. allowed to become relatively hegemonic in recent decades, at the expense of class issues? Because postmodernist grievances don't challenge society's central power-structures, viz. institutions devoted to the ownership and manipulation of capital. Feminism and gay rights, while important, don't pose fundamental challenges to the mode of property distribution; they are relatively un-threatening to the upper classes, which has made possible their success (compared to labor issues). -If you want to get analytically precise about class, you have to bring in Wright's notion of "contradictory class locations" and delve into tedious sociology. The point is that class is as relevant now as it always was, possibly even more so (given that class polarization is increasing, the labor movement is gaining steam in China and elsewhere, economic issues are becoming more explicitly important to people -- although of course they were always the most important thing, since people have to *survive* before they do anything else). But this post has gotten long enough.

Lovely Zhilan. The more I see her, the more I like her. It's unusual (in my experience) to find a woman who really cares about ideas.

*

On the French Revolution.-- One of the fascinating things about the Great Revolution is the essentially simultaneous ascendancy of two very different ideologies, liberalism and nationalism (between which, you might say, lies the concept of democracy). Individualism, atomism, "liberty," as opposed to the unitary general will, national community, popular sovereignty, the "direct" democracy of "*the people*." To speak simplistically, it's the Declaration of the Rights of Man versus the Terror, the "democratic," nationalistic Terror. Or, again, it's the Legislative Assembly versus the insurrectionist Paris Commune of 1792.¹ --As I just suggested, though, between these two extremes, connecting them, is the notion of democracy. For, while the ideology of popular sovereignty or the general will can be perverted into totalitarianism, it is also not wholly opposed to liberalism, since the safeguarding of individuals' rights is surely one manifestation of "Power to the people!"

The best concept of all these is socialism, since (in its classical form) it is an unambiguous fusion of liberalism with popular democracy. Economic democracy, workers' power over their work and lives, leaves no room for anything reeking of totalitarianism; nor is it merely a half-empty equality under the law, as liberalism can be thought of.

¹ Of course, the big Terror and the little terror of the 1792 Paris Commune weren't "popular" in the sense of being supported by a majority of the country, but they were egalitarian, nationalistic, and democratic inasmuch as they were "formed under pressure from the *sansculotte* movement."

*

More reflections on the Revolution.-- An endlessly thought-provoking event. Parallels with both fascism and Communism. Think of the resentment, the desire for revenge, against aristocrats felt by the lower middle class of Paris, similar to the desire for revenge against Jews felt in Germany later. An old society dying, throwing up *enragés*, the “mob,” with their “passion for punishment and terror, nourished by a deep desire for revenge and the overturning of society” (p. 131 of Furet’s book but harking to Arendt’s), a desire that led to the massacring of aristocratic Others, enemies to the Nation, outsiders corrupting the body politic -- “strangers in our very midst” (Sieyès) -- instantiations of nearly the same category that Jews instantiated in Germany in the 1920s and ’30s. French nobles in the 1790s, German Jews in the 1930s -- classes of people who had already lost most of their power and so were socially/economically/politically expendable (as Arendt says), hence the perfect scapegoats. Symbols of the old regime that had smothered the “mob’s” pride, spat at it, but now powerless and so contemptible. The chaos of an old semi-urban civilization in transition, everything in flux, wage-laborers joining with artisans joining with shopkeepers in burning resentment. And the necessity for Bonapartism (Napoleon, Mussolini, Hitler) because of the government’s inability to transcend and subdue political divisions.¹ And then the nationalistic expansionism.² And then the internationally orchestrated passage to a more stable order.

But of course also, in France, the lower classes’ already-beginning hostility in the mid- and late 1790s to the bourgeoisie. “Before it had definitively vanquished the *ancien régime* and the aristocracy, the bourgeoisie was already standing alongside the accused [i.e. the nobility] in the court of revolutionary equality” (Furet). That could be said of the Russian bourgeoisie in the years before and after 1917. And Robespierre’s Terror against “counterrevolutionaries” had perhaps a clearer class element than Hitler’s persecution of the Jews; in any case, it reminds one of Lenin’s and Stalin’s terror against supposed counterrevolutionaries. In general, the French Revolution signified a vastly greater social revolution than fascism [for it was genuinely egalitarian!], and it happened in a country maybe comparably primitive to Russia in 1917. But it ended up going in a bourgeois direction, not an anti-bourgeois direction [unlike the Russian revolution]. Remember Robert Brady’s comment that Italy could have gone either Fascist or Communist after World War I? These primitive riven-by-social-conflict countries in transition....they can go either way. But as I said in my paper on Russia (I think), France simply couldn’t go [in the long run] pro-oppressed in the 1790s (aside from brief phases) because of its lack of industrialism and urbanism, the lack of identical social interests between sufficient numbers of the urban oppressed -- no massive factories, for example, which workers could take over -- etc. It had to go bourgeois eventually, just because the bourgeoisie, or capitalist economic structures, had far more power and more resources than its (or their) enemies. Unlike in Russia in 1917.

But remember what I wrote years ago, that Communism itself had affinities with fascism and vice versa. They were not “opposites in every respect” (whatever it would mean for historical events to be “opposites”). They couldn’t be, if Brady is right that Italy could theoretically have gone in either one direction or the other. For one thing, *nationalism* was an important part of both.

I’ve said it before, but here it is again: all these national convulsions were primarily, from a long-term perspective, *capitalist* revolutions.³ Stages in the transition to a society structured around capital. That was always the inevitable outcome, because of long-term global economic dynamics. In Russia and China

¹ Admittedly, there are differences here between France and, on the other hand, Germany and Italy.

² [Furet states that “one of [France’s] most powerful passions” in the 1790s was “national greatness inseparable from glory.” Sound familiar?]

³ At the same time, though, *popular* revolutions, since capital’s undermining of the *ancien régime* gave the masses freedom (and causes (such as intensified exploitation and communal breakdown)) to rise up against their age-old oppressors. In some places, such as Russia and China, the popular revolution temporarily got the upper hand of the bourgeois revolution. But that was bound not to last in the long run. (In a sense, it didn’t last at all: new “Communist” elites took control immediately.) [I should note that the popular-democratic and the liberal-bourgeois elements of a revolution have the same interests up to a point, for instance in abolishing serfdom. But they soon diverge. In Russia, the popular won out over the bourgeois -- but at the cost of being immediately suppressed by new elites.]

there was the detour through ultra-state-planned economic authoritarianism (and remember that capitalism itself is nothing but *fragmented*¹ economic authoritarianism), but in a world globalizing around the dynamic of capital, such an anti-market economy was slowly going to be hemmed in on all sides, challenged, eroded (black markets, etc.), until it either fell apart (Russia) or adapted itself (China).

--The problem with historians is that most of them lack historical perspective. They immerse themselves in the immediately empirical, people's actions and self-interpretations and power-plays, ignoring the "institutional significance" (especially "economic dynamics") of what emerges. Institutional structures are more explanatory than ideologies. After all, humans have a superhuman capacity for self-delusion. What somebody calls something is quite possibly the opposite of what it is.

*

Ah, Hegel. Good old Hegel. *La dialectique*. "In your end is your beginning." Disintegration of civil society, disintegration of the nation-state, demise of national culture under the pressures of globalization, privatization, business-control over everything, commodification of everything, atomization...but at the same time, on the positive side: death of the nation-state! Hallelujah! No more "passions for national greatness inseparable from glory!" Too many divisions and too much cynicism for that sort of nationalistic infantilism! *Finally! How long have we waited* for this nightmare of the "nation-state" to end?! Centuries! And now it's here, at last! The "nation" is becoming...residual! Corporate capitalism is becoming *everything*, at the cost of the nation-state. The "*national security*" state indeed waxes, but the "imagined community" of the nation wanes. Only its bureaucracies, only its power-structures remain. Its culture is dying. The state now exists for the sake of business and, of course, its own power; all else is effectively dead. [...] --First the nation dies, then...the state and corporate capital die together? One can't exist without the other. But that's a long way off, I fear. Many decades.² Anyway, the point is that in the *negative* phenomenon of contemporary atomization is the *positive* phenomenon of the nation's -- and eventually the [national] state's -- death.

(It was always a somewhat futile endeavor to try to reconcile the nation-state and all it entails with liberalism, i.e. morality. Nationalism and individual rights.... Huh? No. Doesn't work. The more *rights*, the less *nation*; the more *nation* (or *state*), the less *rights*.³ At best, in conditions of the nation-state you can only have a modus vivendi. Liberalism needs socialism, anarchism, a stateless, nationless world, in order to be fulfilled.)

*

It's interesting that the French Revolution's liberalism in some ways helped make possible its illiberalism, its nationalism and authoritarianism. For, by enforcing the vision of a society of atomized individuals and "destroying corporate society" (outlawing "orders" and corporate bodies), the Revolution made it easier for people to identify with the single overarching community of the nation, and harder for them to resist dictatorship and Terror.

It's also interesting that some kinds of atomization are, therefore, evidently compatible with nationalism, while others are not. Contemporary business-imposed atomism undermines nationalism, while the French Revolution's atomism intensified it. One of the reasons may be that the contemporary American

¹ *Relatively* fragmented. (Remember, also, that in Communist countries workers rented themselves for wages, and a form of "profits" was the goal, as in ordinary capitalism.)

² The state is indeed losing its (relative) *independence*, and many of its social functions, but as yet it isn't itself dying. (Or, it's only in the very early stages of its death.) It is merely becoming more explicitly the handmaiden of capital.

³ Well, that formula is simplistic regarding the relationship between the state and rights. In nation-state conditions you need a strong state to enforce rights; but if the state gets too strong in a certain direction, such as the "National Security" direction or the fascist direction, it starts to trample on rights. What you need is a state with oversight by the labor movement and minorities.

version is far more extreme than the “atomism” of 1789, since lately people have become *strangers* to each other, private worlds of solipsism, which wasn’t true in 1789. People could still identify with things back then; that has become harder in the age of neoliberalism. Also, an essential difference is that modern atomism is not inimical to “corporate bodies,” being indeed founded on the existence of such bodies in the business world. Corporate bodies in business have grown at the expense of substantive identification with the nation or the national community (as opposed to the *rhetoric* of nationalism, which is still prominent - - precisely due to its usefulness to certain business interests (in, e.g., the defense and energy industries!)). But of course there are “corporate bodies” all over American society, many of them existing at the expense of national identification. So maybe you could say that revolutionary France’s atomism was, in a sense, the reverse of modern America’s: while corporate bodies were supposed not to exist, the structure of society was *not* such that people were semi-aliens to each other. *Now* we have “interpersonal” atomism but a relative proliferation of so-called corporate bodies (intermediaries between the individual and the state).

*

François Furet, who was a very important historian, apparently started out as a Marxist. But then all that stuff with the Soviet Union in the 1950s happened, and he lost his faith in Marxism and went to the other extreme, the idealist extreme. You know, it’s the old story. Thousands of stupid intellectuals totally repudiating everything having to do with Marxism because of disappointment in the Soviet Union. Idiots. In the same category as the masses in their inability to separate the basic tenets of Marxism from political acts whose enactors claim they have something vaguely to do with Marxism. One of the good things about Chomsky is that he could see through these threadbare appearances and never lose his commitment to materialism, i.e. common sense, just because Stalin and Khrushchev did some bad things. --Even “idealists,” or *especially* idealists, are not very good at ideas!

*

Let’s grant, for the sake of argument, that the French Revolution was precipitated more by the nobility’s grievances than the bourgeoisie’s. And let’s grant that it had definitely un-bourgeois phases, such as Robespierre’s Terror and his obsession with “civic virtue,” republicanism, the general will, a phase that briefly approached totalitarianism. Let’s also grant that people from the bourgeoisie were not the main actors in the Revolution. None of this implies that the Revolution was not ultimately in some sense, or several senses, a largely “bourgeois” event, or that the Marxist emphasis on class is inapplicable to it. First of all, class dynamics can be fundamental to an event even if its actors don’t interpret their actions in class terms or don’t *seem* to be motivated by material interests. The *sans-culottes* may have been consciously inspired by ideas of republicanism or resentment of the rich or status-envy, but mild self-deception isn’t exactly an unknown thing. It’s quite possible that an important motive -- even if they didn’t like to admit it to themselves -- was their desire for greater material comfort, greater economic power, less living-on-the-social-and-economic-margins. What “republicanism” meant for them, in fact, was more *power*, more power over their political, economic, and social lives. Questions of motivation don’t matter much, though. The point is that economic relations, economic conditions, are significant determinants of people’s acts, especially *groups’* acts. What your position is in production relations conditions what kind of information you receive, the kind of people you spend time with, the sorts of places you live in or frequent, etc. Political and cultural solidarity, therefore, are structured largely around the occupation of similar locations in economic relations, due to the similar sorts of experiences that tend to correlate with that.

Besides, resentment or status-envy of the aristocracy, despite not seeming to be a “materialistic” motive, is basically a classist thing. And economically determined (beneath appearances).

As for the Revolution’s significantly -- though not completely -- bourgeois character, at least two things establish that. First, among its long-term consequences were the facilitating of capitalist economic

activity and the spreading of bourgeois cultural norms.¹ The Code Napoléon was quite bourgeois, as was the political liberalism that prevailed off-and-on and then made several comebacks in the mid-1800s and then finally was permanently established (in France) in the 1870s. Economic liberalism, too, which capitalists favored, was in the air in the 1780s and 1790s -- and later -- even if under wartime exigencies and the influence of the *sans-culottes* and peasants it was periodically held in abeyance. The dismantling of feudal restrictions encouraged capitalist activity, as did the Le Chapelier law of 1791 effectively banning trade unions (as guilds), strikes, etc. Aside from *consequences*, you can also consider *origins*. The Enlightenment ideas that inspired the revolutionaries had partially originated in England, the most bourgeois country at the time, and were propagated by Protestants and deists, who mingled in bourgeois, liberal circles. It was through such things as trade, the opening up of markets, the international exchange of ideas, the development of manufacture and science, and the increasing popularity of travel -- all bourgeois things, at least in part -- that the ideological, political, and cultural currents that helped undermine the *ancien régime* and lead to the Revolution spread. Liberalism in all its forms is quintessentially bourgeois, and most of the Enlightenment ideas on which Furet likes to focus were nothing if not liberal. Even the idea of popular sovereignty is liberal in its milder manifestations. In the 1790s it was used to justify un-bourgeois things - - which were a product mainly of the *sans-culottes*' activism, counterrevolutionary upsurges in France, and the foreign wars -- but, yes, in revolutions the people and their representatives tend to get out of hand (from the perspective of the bourgeoisie and their hangers-on). The situation gets out of control, but in the end it subsides to normality. I.e., bourgeois stability.

*

I predict that as an old man looking back on my life (--what a strange thing, to be an old man looking back on life!), what I will see first and foremost is an endless and never-fulfilled search for true love. I will sit in my rocking chair, alone in my living room, thinking about the past. Not regretting, just feeling peaceful and sad in my lack of comprehension. My *complete lack of comprehension*.

*

You, nationalist, are an idiot.-- You can say whatever you want about the importance of nationalism and its challenge to Marxism; in the end, the fact remains that *class*, or economic and environmental situation, is more immediately important to people than "nation," which is an imaginary construction and took centuries of warfare and indoctrination just to be *recognized* by ordinary people. Peasants have always been more concerned with survival etc. than "nationality" -- even since the 19th century, when they were finally made aware of the principle of nationality. Serfs were always more invested in their struggles against the nobility than in some educated elite's preoccupation with "national identity" or whatnot. As for the thousands of years of tribal wars and barbarian invasions and imperial clashes and all that shitheap of history, that was mostly a function of the quest for economic power, material resources, material domination. In recent centuries, yes, a few other things have been added into the mix. But they're ultimately secondary to class domination and subordination, because without *resources* (and their specific distribution, determined by class structures) nothing is possible. Whatever social, cultural, and political institutions there are, and whatever goals they're directed towards, they need resources first, and those depend on modes of production and distribution, which entail specific power-structures with specific interests. "Nation"? Get real.

*

¹ If you take a *really* long-term perspective, as Furet does -- all the way up to 1880, which is when he thinks the Revolution finally ended -- then its bourgeois nature is undeniable.

People usually think of religion as an example of the importance of ideas, and to an extent that's true. But not to the extent that is commonly thought. Religion is not only *ideas*, after all, but also *institutions*. Social roles. Modes of interaction. And simply an excuse to get together with people once or several times a week, to socialize and act out rituals that reaffirm community. These kinds of *behavior*, as opposed to mere thinking about various transcendental ideas, are quite possibly the most important aspect of religion for most people. And one reason why religion is so tenacious in the modern world is that *institutions* are tenacious, especially institutions with a lot of power and resources backing them up.¹ It isn't only "ideas"; it is generation after generation being socialized into institutions, to respect power-structures centered around priests and bishops and reverends and pastors and so on -- an especially easy thing to do because such respect gets people communal affection and allows them to participate in a significant part of social life. In the light of so many satisfying and self-affirming communal rituals molding one from one's childhood, it is easy to understand why millions would believe in God and try to act as he wants (because that means acting as the community wants). "Ideas" are in this case, as in most others, little more than reflections or residues of social behavior. By being influenced by the idea of God, one is being influenced by social structures that one has internalized.

*

Capitalism was never going to be superseded until most of the world consisted of wage-earners, until the peasantry and the landed aristocracy were but a historical memory. The transition couldn't have happened earlier, for many reasons. (For example, the system could not approach terminal dysfunctionality until it had colonized all parts of the world, because, as Rosa Luxemburg said, capitalism has to be able to expand into non-capitalist places (i.e. conquer new markets) in order to survive² -- and as long as it can so expand, it will survive.) The peasantry still exists in parts of the world, but it is being rapidly destroyed. At the same time, capitalism is approaching crisis in its oldest, most advanced markets. [Didn't finish this section.]

*

On Zhilan.-- Most members of the political, economic, and intellectual elites would feel superior to her on account of her occasional social immaturity and unorthodox behavior. But she has a sensitivity and humanity that would shame these people if they had any sensitivity or humanity. She feels, and she thinks, and she empathizes, and she expresses herself -- she has something to express, that is. She *lives*, and in her guileless sincerity illuminates the darkness of others.

*

Intellectual impostures.-- That's the name of a book by Alan Sokal and Jean Bricmont exposing the, well, intellectual impostures of postmodernists. I'll probably never read it, since postmodernism is generally a waste of time, but there are excerpts on the internet. For example in this review of the book by Richard Dawkins:

¹ In the U.S., for instance, since the 1970s conservative business sectors have taken a great interest in religion, with Falwell's Moral Majority and all that.

² [She may have been wrong about that. Colonizing markets outside the capitalist world is an important way of counteracting low effective demand in capitalist society, but I doubt it's a *logical necessity* in order for the system to function at all. On the other hand, once the capitalist mode of production exists all over the world, it's probably only a matter of time before the chronically insufficient demand -- in addition to other factors -- causes the system's collapse.]

The feminist 'philosopher' Luce Irigaray is another who gets whole-chapter treatment from Sokal and Bricmont. In a passage reminiscent of a notorious feminist description of Newton's *Principia* (a "rape manual"), Irigaray argues that $E=mc^2$ is a "sexed equation". Why? Because "it *privileges* the speed of light over other speeds that are vitally necessary to us" (my emphasis of what I am rapidly coming to learn is an 'in' word). Just as typical of this school of thought is Irigaray's thesis on fluid mechanics. Fluids, you see, have been unfairly neglected. "Masculine physics" *privileges* rigid, solid things. Her American expositor Katherine Hayles made the mistake of re-expressing Irigaray's thoughts in (comparatively) clear language. For once, we get a reasonably unobstructed look at the emperor and, yes, he has no clothes:

"The privileging of solid over fluid mechanics, and indeed the inability of science to deal with turbulent flow at all, she attributes to the association of fluidity with femininity. Whereas men have sex organs that protrude and become rigid, women have openings that leak menstrual blood and vaginal fluids.... From this perspective it is no wonder that science has not been able to arrive at a successful model for turbulence. The problem of turbulent flow cannot be solved because the conceptions of fluids (and of women) have been formulated so as necessarily to leave unarticulated remainders."

As it turns out, the real reason for the scientific difficulty of turbulent flow is that the Navier-Stokes equations are hard to solve.

These sorts of writers love to use scientific jargon out of context, as in this relatively lucid but meaningless sentence from Jean Baudrillard: "Perhaps history itself has to be regarded as a chaotic formation, in which acceleration puts an end to linearity and the turbulence created by acceleration deflects history definitively from its end, just as such turbulence distances effects from their causes." And so on and so forth, from a galaxy of respected academics. Bruno Latour, for instance, arguing that a recent scientific discovery that a pharaoh from ancient Egypt had died of tuberculosis was nonsense because tuberculosis was invented (socially constructed) in the 19th century. What a topsy-turvy world, in which people like this are celebrated while *real* people who work two or three jobs to put food on the table for their families get no recognition!

*

Giggling and jiggling.-- I was just watching a series of popular videos on YouTube in which three young guys record themselves getting women's phone numbers on the street. They make it look easy. (It helps that they're in Los Angeles, with the sun and tourists and hedonistic atmosphere.) But in fact it is easy -- in the right circumstances, and with the right confidence and humor. Confidence and humor are all that's necessary (obviously). Women like to giggle; if you can make them giggle a lot, they'll give you their number or, possibly, even go home with you. These three guys have an attractive attitude of *not caring*, of just having fun and not being serious, only flirting. "Girls just wanna have fun," so that's perfect. The problem is that, in men, a personality prone to flirting and charm and unseriousness isn't prone to having meaningful romantic relationships, so when the woman gets smitten by this charming guy she's likely to get her heart broken. It's sad. What initially attracts young women correlates negatively with what is conducive to a meaningful relationship. Thus, women reward men for bad, shallow behavior, while they themselves are discarded and he proceeds to the next woman, who rewards him for his shallow behavior and is in turn discarded.

Said differently, the problem is really that *men* [often] just want to have fun, while women both want to have fun and want to be serious with their man. So women end up hurt, and guys end up having fun. Ironically, though, these initial flirtatious encounters are most fun for the woman, not the man, who is occupied with trying to make *her* have fun (because that's how he validates himself as a man, and how he seduces her). Similarly, sex is often most fun for the woman -- along with most other things in life. She is

less detached from life than he is; she's more "excitable" than he. That's her undoing, because it entails her naïveté and emotional and intellectual receptiveness [compared to men].

[...]

*

Emotional void. Emotional void.

*

Bloodlands, not surprisingly, is a dreary book. Here are examples from Stalin's genocidal artificial famine in Ukraine in 1932 and 1933: "In the face of starvation, some families divided, parents turning against children, and children against one another. As the state police, the OGPU, found itself obliged to record, in Soviet Ukraine, 'families kill their weakest members, usually children, and use the meat for eating.' Countless parents killed and ate their children and then died of starvation later anyway. One mother cooked her son for herself and her daughter.... One family killed their daughter-in-law, fed her head to the pigs, and roasted the rest of her body." In one place, a kind of orphanage, a woman reported that "The children had bulging stomachs; they were covered in wounds, in scabs; their bodies were bursting. We took them outside, we put them on sheets, and they moaned. One day the children suddenly fell silent, we turned around to see what was happening, and they were eating the smallest child, little Petrus. They were tearing strips from him and eating them. And Petrus was doing the same, he was tearing strips from himself and eating them, he ate as much as he could. The other children put their lips to his wounds and drank his blood..."

*

It might seem wrong to maintain, as I have repeatedly, that the modern predominance of bureaucratic social structures and their ethos -- for which industrial capitalism (broadly defined, including the Soviet Union and even "Communist" China) has been largely responsible, in that it is an anti-personal social order in which people tend to be treated as instantiations of such categories as "wage-laborer" and "capital-owner," everyone being a means to an impersonal end, one's humanity necessarily being subordinated to the systemic imperative of accumulating capital, which, moreover, necessitates the proliferation of bureaucracies for the sake of keeping order, regulating workers and society, policing dissent, redistributing resources toward business interests and, occasionally, toward disadvantaged elements of the citizenry that might cause trouble if they aren't mollified, etc. -- bears, ultimately, the principal responsibility for the horrors of totalitarianism (or is at least among the most important *conditions* of it). It might seem that ideological fanaticism, as exemplified in both Nazi Germany and Soviet Russia, has little in common with bureaucratic atomism and inhumanity. But in fact they are related. This kind of ideological commitment -- which is also displayed by the contemporary Tea Party and many mainstream economists and politicians, who have been perfectly happy to sacrifice millions of lives around the world in the service of their Free Market ideology -- is facilitated by atomistic and bureaucratic social structures, which foster the tendency to think and act in terms of "reifications," abstract categories, labels. In a society that functions by categorizing people and subordinating them to overwhelming institutional dynamics, the leap to mass ideological commitment (subordinating humanity to ideological considerations) is not terribly difficult. It is natural, being effectively a sort of extreme subjectivization of what is already the case in institutional functioning. The Free Market ideology is a good example, as is the anti-Semitism of the 1930s (which grew out of decades of institutionalized discrimination and institutional/social inequalities for which Jews were the scapegoat). Atomization and bureaucratization are among the conditions for mass ideological mobilization, which is a condition for totalitarianism. --But, in fact, it turns out that the masses' fanatical anti-Semitism wasn't as important to the success of Nazism as is commonly thought, precisely because this fanaticism didn't exist to the extent you'd think. After the war, Germans were able to move beyond the past

surprisingly easily, going about their ordinary lives and appearing not to be dedicated anti-Semites. Much or most of their earlier *behavioral* anti-Semitism (killing Jews, etc.) had been due simply to their following orders, fitting into the institutional (and social) environment, being good bureaucrats. So, you see, *that's* the horror, *that's* the origin, that institutionalized atomistic alienation, a much more fundamental thing than “ideological” alienation, fanaticism.

[In that paragraph I was confusing two issues, a bureaucratic etc. society as an essential condition for the emergence of totalitarianism, and extreme bureaucracy etc. as the most important and most destructive *manifestation* of totalitarianism. Both claims are true, I think. Mass ideological commitment is more important in the “movement” stage than in the “state” stage.]

*

One of the ironies about Ayn Rand is that her philosophy of extreme selfishness and individualism would, if taken to its logical conclusion and realized in the world, result in a society that bore resemblances to the totalitarianism she fled when fleeing Russia. Let's leave aside her stupid love of laissez-faire capitalism, an impossible economic order that, to the extent it could be approximated, was responsible for the Great Depression and thereby the rise of Nazi collectivism. ...On second thought, no, let's look at this laissez-faire capitalism, since it is one manifestation of her vision. If a *pure* version of it were possible, it would be something like Murray Rothbard's “anarcho-capitalism,” which, as Chomsky says, is “a world so full of hate that no human being would want to live in it.”¹ As someone once said, maybe Hannah Arendt, the closest we've ever come to a society of pure selfishness and individualism was Auschwitz, which was the culmination of a kind of totalitarian collectivism. The parallels between Nazi (and Soviet) collectivism and Randian or Rothbardian individualism are significant: they're due to the profound atomization that each entails. In the latter, the individual is to treat everyone as a means to his end; in the former, the individual is to treat everyone as a means to the state's (or the movement's) ends. In both cases, no human connections are allowed, no treating the other as a being with his own value and his own claims on one's respect. Hate, mistrust, and misery are the inevitable consequences of both these dystopian visions.

Needless to say, people like Rand and Rothbard are not to be taken seriously, except as symptoms. But it's fun to glance at them sometimes because of all the little ironies you'll notice.

*

Smoking.-- Now that I've taken up smoking (though barely; a cigarette every day or so), I understand the appeal. In a life from which you derive insufficient satisfaction, a life in which life is aimless,

¹ The footnotes to *Understanding Power* have excerpts from one of Rothbard's “libertarian” books: “Abolition of the public sector means, of course, that *all* pieces of land, all land areas, including streets and roads, would be owned privately, by individuals, corporations, cooperatives, or any other voluntary groupings of individuals and capital.... Any maverick road owner who insisted on a left-hand drive or green for ‘stop’ instead of ‘go’ would soon find himself with numerous accidents, and the disappearance of customers and users.... [W]hat about *driving* on congested urban streets? How could this be priced? There are numerous possible ways. In the first place the downtown street owners might require anyone driving on their streets to buy a license.... Modern technology may make feasible the requirement that all cars equip themselves with a meter....

“[I]f police services were supplied on a free, competitive market....consumers would pay for whatever degree of protection they wish to purchase. The consumers who just want to see a policeman once in a while would pay less than those who want continuous patrolling, and far less than those who demand twenty-four-hour bodyguard service.... Any police firm that suffers from gross inefficiency would soon go bankrupt and disappear.... Free-market police would not only be efficient, they would have a strong incentive to be courteous and to refrain from brutality against either their clients or their clients' friends or customers. A private Central Park would be guarded efficiently in order to maximize park revenue.... Possibly, each individual would subscribe to a court service, paying a monthly premium.... If a private firm owned Lake Erie, for example, then anyone dumping garbage in the lake would be promptly sued in the courts.”

it's a consolation. It's like saying "Fuck it." When I have a cigarette in my hand, I'm taking a break from the world. It's an escape from doing nothing, living nothing -- or rather an escape from false and empty somethingness.¹

*

From Simone de Beauvoir.-- "The advantage man enjoys....is that his vocation as a human being in no way runs counter to his destiny as a male.² Through the identification of phallus and transcendence, it turns out that his social and spiritual successes endow him with a virile presence. He is not divided. Whereas it is required of woman that in order to realize her femininity she must make herself object and prey, which is to say that she must renounce her claims as a sovereign subject." Well said, and true. It is conceivable that as applied to some society twenty thousand years from now, de Beauvoir's statement will need qualification, but as applied to history and people up till now, it is true. Why? Because to be a fully realized human being means to be active, to be free, to create and express oneself, to actively seek recognition by impressing oneself on the world and others. But this is also, in a slightly different way, what it means to be masculine, due to biological tendencies in the sexes. (The sexes naturally define themselves in opposition to each other, and because of biological facts about men and women, men end up being defined as more active than women.) Many men, of course, don't achieve the ideal, but to that extent they're not masculine. If women, however, fail to be active and self-creating and free, that doesn't count as a failure in their capacity as *women* but only as *humans* (and as *selves*, which have to be "self-certain," "confirmed," etc. in order to be fully realized). So, yes, full humanity, or "self-sovereignty," and full femininity are in tension.

If, however, you take the *moral* perspective on the nature of humanity, according to which the human ideal is to personify the Golden Rule, then there is no particular tension between femininity and humanity. (Nor, perhaps, between masculinity and humanity.) Unfortunately this is not the perspective that people instinctually seem to take. They unconsciously respect dominance and activeness more than kindness and compassion. The former traits are more interpersonally and instinctually *compelling* than the latter. Therefore, men are at an advantage.

Obviously the only thing that can be done to mitigate this situation is to socialize women in such a way that they don't feel the need to be exceptionally feminine. There is a time for accentuating femininity, namely in sexually charged interactions with the opposite sex, and there is a time for not accentuating it but just being *human*, namely in most other contexts. Women have to navigate the tensions between these roles.

*

The history of nationalism is intriguing. Until about the middle of the 19th century, nationalism in Europe had progressive, egalitarian, and universalist connotations. It was liberatory, directed against the hierarchies, exclusions, and oppressions of the *ancien régime*. In Poland, for example, "to speak of national liberation was to imagine a chiliastic moment of emancipation for all humanity -- 'for our freedom and yours,' as the slogan of the day put it" (Brian Porter). This was true in France also, and Germany, and probably anywhere else nationalism reared its head. By the end of the century, however, nationalism had completely changed its character. It was now *ethnic*, exclusionary, reactionary, anti-Semitic in most cases, and authoritarian. Fifty years earlier, Polish nationalism had been perfectly compatible with the recognition of Ukrainians, Lithuanians, and even Jews as Poles (according to Porter). In 1900 or so....no way. The germs of fascism and even Nazism were apparent in most nationalisms by then. So what explains the change? It isn't that earlier nationalism was primarily an affair of elites while later nationalism was an affair of the masses -- i.e., that the masses defile everything they touch, etc. -- because around the turn of the

¹ [I wrote that when I was in a bad mood. I guess I don't have to point out that smoking is also, well, just plain fun.]

² I quote this passage because the reader, being, probably, highly educated, won't take seriously any of my ideas unless he sees they have been said by a famous intellectual before me. And I've expressed the ideas in the quoted passage many times.

century it was precisely, in many cases, elements of the elite that were most reactionary, anti-Semitic, and authoritarian. The explanation is more complicated. I haven't read Porter's book yet, but obviously the answer has to do with the whirlwind of industrialization and international migration that swept the continent. My hunch is that earlier in the century, nationalist intellectuals and the like had no reason to propagate authoritarianism, cultural exclusionism, and so on, because their main concern was to achieve political power, independence, and freedom vis-à-vis the old absolutist or foreign (in the case of, e.g., Poland) elites that ran the country in their own narrow interests. And because intellectuals identified their own interests with those of humanity -- as everyone tends to do -- their "nationalism" entailed the advocacy of freedom etc. for all peoples. Nationalists' task was to overthrow their political oppressors, dismantle feudal restrictions, and, in a sense, *create* the nation (and put themselves at the head of it); there was no point to authoritarianism when they were out of power, nor to cultural exclusionism when the principle of nationality still wasn't even acknowledged by most people. They had to bring people together first [partly in order to throw off the oppressors]; then, later, maybe it would be possible to exclude people.¹

By the end of the century, political elites -- in Western Europe, at least (France, Germany, Italy, etc.) -- were propagating nationalism for its usefulness in keeping order and unifying the state in times of economic and social turmoil. So authoritarianism, exclusionism, and forms of social conservatism entered the house of nationalism through this door. Also, industrial interests were, I suspect, propagating a blend of anti-Semitism and nationalism partly as a way to divert the masses from class struggle -- blame the parasitic Jewish financiers, you know, not us "productive" capitalists -- and partly because many industrialists had a real hostility towards powerful financial interests. (Think of Ford's anti-Semitism, for example.) In addition to all this, Western European intellectual elites' problems had changed. The main threat to their power and to the existence of the nation-state was no longer the political regime but instead elements of adulteration and subversion. To the extent that intellectuals were now in the service of the state, they shared the state's interest in suppressing dangerous class conflict and democratic strivings and in manipulating popular rage and resentment so that it was directed towards Jews and foreigners. (It's quite possible that most of these intellectuals (such as those in the media, in academia, and in government bureaucracies) were convinced by their propaganda, that they believed Jews and foreigners really were behind all the social problems that kept cropping up.) Those nationalist intellectuals who *weren't* in the employ of the state or the media, who were oppositional and in some sense "revolutionary" (as they saw it), likewise had more to fear from social, cultural, and ethnic adulteration than from the state (except insofar as they thought it was in the service of "adulterating" elements of some sort), because a powerful state, being now [by the 1890s] truly national, was in itself not inimical to the realization of nationhood but potentially even its quintessence -- if, of course, it was delivered into the hands of these rebel intellectuals. What appalled and frightened them was the chaos, filth, decadence, materialism, waywardness, etc. of their society, all qualities that offended their intellectual craving for purity, order, meaning, beauty, heroism, and *power* -- the empowerment of their pure, beautiful, heroic, etc. vision (and thus of themselves). Hence their embrace of exclusionism, authority, and a kind of social conservatism.

Much of what I've said about Western Europe applies to Eastern Europe, except that the situation was made more complicated there by the fact that many "nations" had not yet achieved national independence. So it wasn't in the interest of Austria-Hungary, for example, to propagate nationalist ideologies; those were precisely what it wanted to suppress. Conversely, politically rebellious intellectuals were committed to the progressive cause of national independence, even as developments in Western Europe and their own societies had also raised the specter of cultural adulteration and chaos, thus committing many intellectuals to reactionary ideologies of exclusion and authority. What they had to fight against, in other words, was no longer only a foreign state but also the cultural and social disintegration of their nation (under the influence of industrialism, immigration, etc.).

¹ [Porter has reminded me of *romanticism's* contribution to the idealism and universalism of early 19th-century nationalism. Universal freedom, creativity, humanity, *action*, the *freedom-enacting act* as defining the nation. It's a spiritual thing, an ethical thing, *ideals*-defined, not an ethnic or "sociological" thing. Porter refers to "the 'abstraction' of romantic nationalism, with its transcendent spirit and its mystical vocabulary."]

I forgot to mention above the role of *imperialism* in giving nationalism in Western Europe a reactionary character. That was tremendously important. Nationalism, combined with racism, meant apologetics for imperialist brutality. (We're civilizing the savages, etc.) Moreover, such brutality abroad smoothed the road to brutality -- and certainly brutal ideas -- at home, justified in part by nationalist considerations. Also, imperialism heightened Europeans' racial consciousness (sense of racial distinctiveness and superiority), which exacerbated anti-Semitism and other kinds of interracial hostility -- which fit in nicely, though not *perfectly*, with nationalism. Of course ideas and practices that originated in Western Europe spread to the East.¹

Anyway, those are my hypotheses. Let's see what Porter has to say now....

*

Thoughts on the first half of the twentieth century.-- The catastrophe of the second "Thirty Years' War" had many causes, but right now let's consider the ideological ones. As I think I said years ago, nationalism, racism (as a systematic philosophy), and anti-Semitism were both reactions against and sublimations of the atomized, competitive, depersonalized capitalist society of Europe at the time, with its implicitly Social Darwinist structure. But even earlier in the nineteenth century, ideological reactions -- relatively benign ones -- existed. Romanticism and Transcendentalism, for example, escaping from the ugly, selfish, competitive world of early industrialism into quasi-mysticism, idealism, art, universalism, exalted morality....but also a transformed individualism (hence the "sublimation" aspect). At the same time, for the masses there was religious revivalism -- which, in its manifestations, sort of fused communalism and individualism, as all mass ideologies of the last two centuries have. So there were these early "reactions and sublimations," which didn't last. (There were also, of course, early workers' movements, but right now I'm considering "existential" movements and ideologies, not rational-interest things like fighting for higher pay and better working conditions. On the other hand, such movements can serve an existential purpose too, by allowing people to immerse themselves in a collective cause.) After the middle of the century, it seems that existential movements faded away for a while (except among pockets of intellectuals and students, and maybe in parts of Eastern Europe) -- only to reemerge with a vengeance in the 1880s and afterwards. This time the ideologies were more political, and some of them related not only to emotional and intellectual needs but also to "rational" social interests. So, socialism and Marxism spread, and Populism in Russia, and varieties of nationalism, some of them genuinely concerned with social justice (as well as, in Eastern Europe, political independence and freedom). But among nationalists it became difficult to serve two gods at once, the nation and social justice, so the camps split apart around the 1890s (in Poland, for example), one committed primarily to socialism -- although also the nation inasmuch as it identified the "real" nation with the proletariat and/or other oppressed classes -- and the other to national unity and greatness. This latter camp became increasingly attracted to an "aesthetic" morality rather than a "justice" morality, taking inspiration from Social Darwinism and vulgarizations of Nietzsche. Etc.

Anyway, I already made the point I wanted to make in the second sentence of this section. Fin-de-siècle nationalism and anti-Semitism were uniquely powerful ideologies, accepting as they did the realities of power and struggle in the modern world, exalting authority, hierarchy, Social Darwinistic struggle, even hatred (against the national enemy) -- thus proving useful to power-structures, effectively legitimizing them and their ever-greater accumulation of power -- but also promising the individual an escape from the horrors and petty daily miseries of all this struggle, these hate-producing hierarchies and social inequalities and structures of atomized competition, by holding out the *nation* as an arena of harmony and order and a kind of collective freedom, an arena in which one's material interests and emotional needs would be satisfied by one's immersion in the ordered mass. Nationalism in a sense accepted and legitimized all the dissonant and inequality-perpetuating aspects of modern life, by displacing them from an interpersonal to an international

¹ Obviously the East had its own indigenous anti-Semitism too.

and interracial realm.¹ So people could continue to feel as much resentment and hatred as they wanted without thereby feeling weak, unsuccessful, and confused, because now they knew how to make sense of their hatred, indeed that they were *supposed* to feel hate, that it made them good patriots. They could wallow in their diffuse resentment with a good conscience -- because at the same time they were rising above it and gaining power over it, channeling it into something meaningful and communal. And since nationalism was at bottom an emotional thing, not serving people's material interests, it was invaluable, as I said, to economic and political power-structures, which therefore fomented it, stoked it into a continent-wide conflagration. *Two* conflagrations.²

After World War II, finally, the powerful realized that vicious nationalism wasn't so useful to them after all, so they stopped subsidizing its propagation.³ Instead, the welfare state and social regulation emerged to soften capitalism and keep the masses obedient. Now that postwar statism is dying, social polarization is returning to its old extremes and discontent is flaring up everywhere. Luckily *this* time nationalism won't be able to muck things up as much as it did a hundred years ago. It's the age of internationalism, or even "transnationalism."

*

The "positive" point of view.-- When I interact with my roommates, or when I read the news, I remember that humans are apes; you shouldn't expect too much. Indeed, instead of being appalled by the savagery and stupidity of the species, we should be impressed that apes have achieved so much.

*

Occupy Wall Street.-- This movement, which I assume you've read about in history books, will surely not bring about much or any change in the short term, because that would require a *massive* mass movement. But it is an early example of what I've predicted, the uprisings and disturbances that will become more frequent in the coming years. Unfortunately they won't be able to stop continued privatization. Maybe ten years from now there will finally have developed *massive* resistance to corporate power; it will take years more, however, for anything substantive to be done about it. --Notwithstanding all that, Occupy Wall Street is exciting, in part because networks are being formed for a global movement.

*

Regarding Russia in the last years before its revolution, Orlando Figes remarks that "Frank and Berdyaev argued that the atheist and materialist attitudes of the intelligentsia had tempted it to subordinate

¹ [I think what I meant here, or one of the things I meant, is that, according to nationalism, if these "dissonant" aspects of life continued to exist it was because of foreigners and members of other races. This doctrine effectively "accepted" and "legitimized" them, because of course they were due mainly to inter-*class* competition, not international or interracial. Power-structures therefore seized on nationalism as effectively allowing them to go on exploiting people, with the people's confused consent. --Another thing I meant is that nationalism saw conflict and struggle as an inherent and even valuable part of life, and in this sense legitimized them. This, too, made it useful to the powerful -- but also to the powerless, because, as I say in the text, it legitimized their diffuse hatred.]

² [When I wrote this I should have noted also that the extremely powerful business interests involved in *armaments*-production had good reasons to promote nationalism, and did so. So that's an example of nationalism's "modern" face. On the other hand, in many places the Catholic church embraced the nationalist movement and vice versa, so that's an example of its "anti-modern," "anti-capitalist" face. Indeed, its fusion with Catholicism was an important reason for the peasantry's embrace of nationalism all over the continent. --What a devilishly brilliant and hybrid ideological concoction these European intellectuals created! Had it not been for its *material* usefulness to the powerful and its *emotional* usefulness to the powerless (as well as their *belief* in its *material* usefulness to them), it surely would have been dismissed as the twisted fantasy of a bunch of kooks.]

³ [That's an over-simplified statement, but it contains some truth.]

absolute truths and moral values to ‘the good of the people.’ On this utilitarian principle the revolutionaries would end by dividing society into victims and oppressors, and out of a great love for humanity would be born a great hatred for vengeance against particular men. [Recall what I’ve said about the dangers of *abstraction*. “Abstraction” (reification) as the origin of “evil.”] B. A. Kistiakovsky condemned the tendency of the radical intelligentsia to dismiss the ‘formality’ of law as inferior to the inner justice of ‘the people.’ The law, argued Kistiakovsky, was an absolute value, the only real guarantee of freedom, and any attempt to subordinate it to the interests of the revolution was bound to end in despotism.” It reminds me of Robespierre, and maybe other revolutionary tyrants from the twentieth century. There is wisdom in K.’s words. But it isn’t *the people* who are the danger, and it isn’t *the law* that is the savior. The savior is the *institutional apparatuses* of law, as the danger is the lack of these apparatuses. The problem with some sort of relatively pure democracy -- at the industrial capitalist stage of history¹ -- isn’t the supposed bloodthirstiness of the people or some such thing but the corresponding[-to-“pure”-democracy] lack of institutional defenses against the rise of a tyrant. What you need are “corporate bodies” to prevent the atomization of society, as well as a state the bureaucracy of which functions according to the canons of liberalism. Together, these safeguards might very well prevent despotism. They were lacking in France and Russia (and China) in the relevant periods.

*

As I suggested above, and as some scholars have suggested, it makes a lot of sense to think of the period between 1914 and 1945 in Europe as effectively one long but interrupted war. It was a state of periodically-active and periodically-suspended war. Thinking of it in this way is illuminating, since it highlights the fundamentally similar causes of both European wars, namely nationalism, racial thinking, industrial capitalist competition (in a nationalist framework), imperialist policies and cultures, social atomization making possible the rise of demagoguery, virulent class conflict and mass resentment being sublimated into racial and national hatreds, and the final clash between a dying society (landed aristocracy and peasantry) and a rising one (industrial capital and labor) -- a clash not manifest in any clear way but obviously, through mysterious chains of historical causation, integral to the war(s) anyway.

*

Slavoj Žižek’s great talent is self-promotion. I’ve read some of his writings and watched interviews, and my impressions are that what he says isn’t profound but that the way he says it is colorful (and makes it *seem* profound). He has charisma and a big head and body, so he’s noticed. But what he says is often either obvious or obscurantist. Or it’s just rambling verbiage. He’s one of those clownish postmodern self-promoters, loving to provoke and cause a sensation -- like when he said once that the problem with Hitler was that he wasn’t violent enough. Predictably that caused a stir, because intellectuals and media-types care more about verbal appearances than substantive things. What he meant was that Hitler’s violence didn’t fundamentally challenge the system, and that in that sense Gandhi was more violent. Okay, fine, whatever. Great contribution. Let’s play on the meaning of “violence” and twist it around to provoke our liberal friends. And to capture the headlines. If it obscures clear thinking, so be it. Being postmodernists, we’re interested more in image than substance.

In truth, someone like Glenn Greenwald is a much more impressive thinker and scholar than a Žižek. *Reason*...simple *reason* is the rarest thing in the world. What you have instead are fashionable decadents like Žižek, who give intellectuals and the media something to do. (I’m always surprised when real merit achieves fame. Like Greenwald, Naomi Klein, Howard Zinn, Chomsky, and other such people. That shows there are cracks in the system -- more and more nowadays, in fact, even at the “intellectual” level.)

¹ Or at least the stage in which industrial capitalism is *emerging*.

*

The clean air of the Baroque.-- Notwithstanding the uniquely life-affirming character of Beethoven's music, Bach has pieces that are more invigorating than anything except, perhaps, standing atop Mount Washington or some other peak close to the heavens.

*

The book jacket of François Furet's *Revolutionary France 1770-1880* (1995) states that the work is "a testimony to the power both of ideas and of personality in the movements of the past." This is true. Furet offers a political history from the perspective of ideas and personalities, and his endeavor is quite successful. Its success is due partly to the undogmatic nature of Furet's "idealism" -- for he does not completely ignore social and economic conditions or administrative structures -- but, nevertheless, Furet demonstrates that ideas and powerful individuals do have great influence on history and cannot be wholly neglected in favor of "material" causes. The book's analyses of ideological currents and the consequences of ideas are fascinating. Ultimately Furet does devote too little attention to society and the economy, and he overestimates the causal power of ideas, but his book remains a great achievement.

One of its most fruitful themes is that the Revolution was guided and misguided by tensions between its animating ideas. In particular, two legacies from the Enlightenment met and battled for hegemony: first, liberal individualism, "according to which the constituent element of the social pact is the free activity of men in the pursuit of their interests and their happiness," and second, "a very unitarian conception of the sovereignty of the people, through the idea of the nation or 'general will'" (p. 87). The revolutionaries of 1789 "made a fragile synthesis of them," but the synthesis came apart under the impact of war and Terror. The liberal regime of law and individual rights was suspended in favor of a nationalist regime of the "general will" as embodied in the National Convention, particularly in the Committee of Public Safety. As Furet states, this regime "in effect constituted the application....of what was perhaps the French Revolution's supreme principle: the absolute and indivisible sovereignty of a single Assembly, deemed to represent the general will stemming from universal suffrage" (p. 136). Because "the people had appropriated the absolutist heritage and taken the place of the king," they had to be imagined as *one entity*, "independent of the private interests characterizing each of their individual members" (p. 140). The dictatorship of Robespierre was therefore implicit, so to speak, in the French Revolution's ideology. It was an inherent possibility from the beginning, and the ideology in a sense led to it. Or so Furet argues.

One might almost say that the central feature of *Revolutionary France* is its continual unearthing of new "tensions" that propelled French history forward. For instance, Furet argues that "it was the tension between the idea of democracy and the extent of inequality retained by the Constituent Assembly in the new body politic which formed the mainspring of the Revolution" (p. 99). Similarly, he refers to the "tension between philosophical abstractions and political realities" (p. 87), as manifested for example in the repeated resort to arbitrary power despite the Revolution's ambition to create a society of law, liberty, and equality. This was related to the tension between France's absolutist heritage and its modern Enlightenment fixation on republicanism, liberalism, and democracy.

Other tensions include that between the Revolution's nationalism and its universalism; the career of Napoleon is a perfect illustration of this, given, on one hand, the nationalist pride he evoked in the French and, on the other, his serving their desire to liberate all Europe from tyranny and spread democracy around the world. Even before the Revolution, however, tensions proliferated. A particularly pregnant one was that between the monarchy's modernizing tendencies -- its administrative centralism and reform, its "subvert[ing of] the traditional social fabric by levelling its ranks under general submission to a sole authority, and breaking up the hierarchies of birth and tradition" (p. 9), its progressive stripping of the power of the nobility and clergy -- and its deep "solidarity with aristocratic society" (p. 13). The result was that "royal action [throughout the eighteenth century] oscillated between despotism and capitulation" (*ibid.*), and the monarchy gradually lost the support of both the nobility and the broader society. This loss was manifest in the evolution of "public opinion," which became a "counterbalance to despotism, developed by

men of letters.... It constituted a public tribunal, in contrast with the secrecy of the king; it was universal, in contrast with the particularism of 'feudal' laws; and objective, in contrast with monarchic arbitrariness: in short, a court of appeal of reason, judging all matters of state, in the name of public interest alone" (p. 17). "Public opinion" became fixated on the revolutionary idea of establishing a "monarchy of reason" on the ruins of the feudal/absolutist monarchy. Furet returns again and again to this notion of public opinion and its solid opposition to arbitrary executive authority. The reader is left with the impression that public opinion is the one underlying constant in this era, the element of stability in a time of upheaval, the most consistent manifestation of reason and moderation, and the centripetal influence on wildly fluctuating political affairs, to which in the long run they inevitably tend.

In short, the book is extremely rich and cannot be summarized in two pages. A final critique, however, can be offered. Furet's analysis is intriguing in its discernment of a "logic of ideas," a dialectic of ideas and their interaction with social conditions, behind the seeming chaos of the French Revolution and its aftermath, but ultimately it is not ideas that primarily make history. An alternative analysis would focus on economic movements, on the people and institutions with the most resources and power, on the play of *interests* as opposed to the play of philosophical abstractions in their encounter with reality. Also, Furet's emphasis on personalities is in tension with his emphasis on the "dialectic of ideas and reality," since personalities introduce contingency into a discussion that tries to find necessity wherever it can. *Revolutionary France* would have been an even greater book had its author thought more carefully about his methods and assumptions.

One of the best qualities of *The European Revolutions, 1848-1851* (2005), by Jonathan Sperber, is that it shows common sense. Intellectuals throughout history, from ancient times to the present, have liked to interpret society in terms of ideas, philosophies, "discourses," etc., as if these were the most important elements of reality. Such an interpretation is understandable, since intellectuals, who traffic in ideas, want to think that what they do is important; therefore, they declare that ideas are the foundation of the world and the prime mover of history. Jonathan Sperber avoids such a naïve idealism; he interprets politics in the light of socioeconomic conditions and treats ideologies as what they are, sublimations of these conditions. Corresponding to his basically materialist approach is his emphasis on the experiences of ordinary people far from the centers of revolutionary activity, the capital cities and parliaments and barricade struggles. Whereas older historiography was seduced by the glamor and romance of national leaders and impassioned parliamentary debates, the newer tradition in which Sperber places himself is largely interested in the neglected uprisings and civil wars of 1849 and 1851, and in "the obscure local activists and the craftsmen, laborers, and peasants who made up a majority of the European population and of the participants in the revolutionary events" (pp. 2, 3). This new tradition also does not treat the revolutions with condescending scorn because of their failure; it takes them seriously, in part due to their lasting impact on the nature of popular political participation.

Sperber's materialist approach manifests itself in several ways. First of all, he places the revolutions in the context of ongoing social and economic conflicts, including the one "more prevalent than any other in mid-nineteenth-century Europe," viz., "conflict over the collective use of agricultural land" (p. 40). This particular clash of economic interests was a result of the slow spread of private property across the continent, which entailed the abolition of land held in common by peasants, landowners' acquisition of forests as their own private property (on which peasants continued to trespass in order to obtain necessary wood), and so forth. In most of central and eastern Europe, the conflict between lord and serf engendered "violent, murderous hatreds" (p. 43). In manufacturing and crafts, there were conflicts between masters and journeymen, "outworkers" and the merchants who employed them, and capitalists and laborers. Aside from emphasizing such ongoing struggles, Sperber argues that the economic crisis of 1845-47 was the "precursor to and precondition for" the 1848 revolutions, in that it escalated popular discontent.

Not only the revolutions' origins but also their conclusions get materialist treatment. Briefly stated, the final reason for the downfall of revolution is that it was crushed by military force. This is what happened, for example, in Paris in June, 1848, when thousands of workers who had set up barricades in the streets to overthrow the new bourgeois republican government were massacred by the National Guard. It is also what

happened in Germany, Italy, and throughout the Austrian empire, where a number of nationalist uprisings were brutally suppressed.

The attention that Sperber gives to nationalism is perhaps the least “materialist” aspect of the book (although it must be said that integral to the national movements were progressive social and economic programs). He argues, plausibly, that one of the main causes of revolutionary failure in central and eastern Europe was that “the different national movements fought each other, and cancelled each other out” such that they allowed the triumph of their common reactionary enemies in the government, the nobility, the army, and the Catholic Church (p. 147). In the French Revolution of 1789 and the following years, nationalism had strengthened and radicalized the revolution in a country beset by a hostile Europe; by 1848, many nationalisms had spread across the whole continent, clashing with each other and so weakening the revolution.

The most interesting parts of the book are its discussions of the long-term legacies of 1848. “By far the most significant and never altered consequence of the revolution,” Sperber argues, “was the abolition of serfdom and other seigneurial institutions. These changes, won by rural uprising and decision of the revolutionary parliaments, were nowhere reversed, even by the most reactionary of the post-revolutionary governments” (p. 273). Aside from such concrete political and economic achievements, arguably the most significant legacy of the revolution was its introduction of the European masses to political mobilization. Political clubs were the most common means for this. Such clubs were associations whose members met regularly to debate political questions “and to organize petitions, election campaigns, [and] public mass meetings or demonstrations” (p. 167); they dated from the French Revolution of 1789, but in 1848 they introduced millions more to organized political activity. These initial mass political experiences helped shape European politics for the rest of the century.

As an overview of the 1848 revolutions, Sperber’s book has few weaknesses. It is very rich, lucidly written, balanced, sensible, and a comprehensive introduction to recent historiography. Notwithstanding his materialism, Sperber may be a bit too dismissive of the Marxist emphasis on class conflict, for example with regard to the June, 1848 struggle in Paris between workers and the liberal government. On the other hand, someone of an idealist mindset might criticize him for not devoting enough attention to ideological analysis. An author can never please everyone; however, he can probably not come much closer to doing so than Sperber has.

[Insightful comments from Sperber that didn’t make it into my paper: “Possibly the single best way to understand the revolutions of the mid-nineteenth-century [is by interpreting them as] a greatly expanded, partially revised, and, with ‘success’ narrowly defined as long-term change of regime, ultimately unsuccessful version of the French Revolution of 1789. Their outbreak and ultimate suppression both closed the cycle of revolution begun in 1789 and opened the way towards a different version of politics on the European continent.”]

Once upon a time, in the early nineteenth century, European nationalism was progressive, democratic, idealistic, and universalist; later, it became reactionary, authoritarian, “realistic,” and parochial. When and how did such a change happen? That’s the question Brian Porter asks and partially answers in *When Nationalism Began to Hate: Imagining Modern Politics in Nineteenth-Century Poland* (2000). His method is to focus on a particular country, Poland, and to retrace the evolution there of “discursive frameworks” pertaining to the concept of nation from the early to the late nineteenth century. He “explores how writers, artists, political activists, philosophers, poets, journalists, military officers, and others in nineteenth-century Poland used the term ‘nation’” (p. 5). Contrary to the assumptions of many scholars, he argues that it was not simply “inevitable” that nationalism would degenerate into a violent, exclusionary ideology by virtue only of its “logic”; nor did such degeneration happen only when the ideology finally became a mass movement, as is often thought. Rather, intellectuals had to “reconfigure the very concept of the nation” before nationalism could turn into a hate-saturated ideology -- and that transformation occurred *before* it became a mass movement. This argument, like most of the others in the book, is convincing. In the end, however, the book’s narrow focus on rhetoric and intellectual debates limits its completeness as an account of the rise of Polish nationalism.

Porter begins by considering the “good” kind of nationalism that prevailed in the first half of the century. It was essentially a manifestation of romanticism, and so was mainly an affair of intellectual elites. In this ideology, the “nation” was scarcely a defined entity at all; it was not an ethnically and culturally homogeneous community with regard to which there were “outsiders” and “insiders.” Instead, it was an ideal, “a principle that gave meaning to history.... Poland, which was said to exist in the hearts of all Poles, embodied an ethical principle and acted as a motive force in history” (p. 20). Specifically, Poland embodied the principle of *freedom*, as opposed to the tyranny and evil that Russia (which ruled over much of Poland) embodied. For the nationalist, “to speak of national liberation for Poland was to imagine a chiliastic moment of emancipation for all humanity -- ‘for our freedom and yours,’ as the slogan of the day put it” (p. 5). Ukrainians, Lithuanians, even Jews could be Poles if in their acts they embodied the patriotic and revolutionary principles of freedom and justice. Such an ideology made it difficult for one to be both a Polish nationalist and a political conservative.

This romantic nationalism, which celebrated the patriotic *deed* rather than a particular ethnolinguistic community, collapsed after the January Insurrection of 1863, a year that Porter compares to 1848 in Western Europe. It crushed the old illusions and idealism, and started the process that would culminate in reactionary Polish nationalism three or four decades later. What happened, in brief, is that after the defeat of high-minded romantic nationalism in 1863, intellectuals returned to earth. A group of them, called (misleadingly) the “positivists,” embraced liberalism and science so as to define and hopefully elevate the nation, which now became an ethnolinguistic community rather than an ideal or spirit. This conceptual move set intellectuals on the path toward “solidifying cultural boundaries” and ultimately excluding categories of people from the nation, who became as a result the “enemy.” The positivists themselves, however, did not go to this reactionary extreme; they remained historical optimists who looked forward to a future liberal utopia.

One of the most interesting arguments in Porter’s book is the claim that what separated liberal and socialist optimists from authoritarian nationalist “pessimists” was a sense of “historical time.” In the late 1880s a split occurred amongst leftist intellectuals in Warsaw: some of them drifted away from socialism and towards nationalism. Porter’s argument is that the main reason for this split was that the future nationalists lost the Marxist faith in historical inevitability and teleology. They decided that if a revolution were going to happen it would have to be *willed*; one could not simply wait for the “laws of history” to bring it about (in part because “the people” did not have sufficient understanding of their own interests). In order to will a revolution, however, *social discipline* was necessary, *order*, *strong authority* to guide the masses in the right direction. The socialists could tolerate subversion and disorder in the present because of their faith in the future; the nationalists could not, which led them to eschew talk of class struggle in favor of “the ‘duty’ of workers and peasants to subordinate their own needs to a higher cause and to obey their betters” (who were supposedly acting, however, in the interest of workers and peasants) (p. 144). The abandonment of class struggle meant the embrace of national struggle. But the question then arose: if “the nation” or “the people” included the vast majority of the country -- even aristocrats and most of the bourgeoisie -- who was *not* a member of the nation? The answer had to be outside agitators, foreign exploiters, and Jews. Thus, through a few conceptual moves, former leftists and socialists arrived at a position that, despite their own self-understandings as revolutionaries and democrats, amounted to a version of the radical right.

Porter’s reconstruction of nationalists’ logic is convincing; the whole book, moreover, succeeds in showing how the liberatory nationalism of the 1830s, while not really *turning into* the authoritarian nationalism of the 1890s -- for the latter had different origins in a different social context (the 1880s) than that of the 1830s -- gave way to it. Ultimately, despite Porter’s aversion to the label, the book is essentially an intellectual history, and a good one. As stated (or implied) earlier, however, to really explain the rise of modern Polish nationalism it would be necessary to pay much more attention to socioeconomic forces and the international social and cultural context than Porter does.

Tensions of Empire: Colonial Cultures in a Bourgeois World (1997), edited by Frederick Cooper and Ann Laura Stoler, is a typical product of the postmodernist impulse as manifested in historical

scholarship. Like all postmodernism, it deals primarily with “discourses,” with the play of contradictory subjectivities, identities, ideas, cultures, “vocabularies,” “grammars,” etc., in this case in the context of European colonialism. Specifically, the editors and contributing authors are interested in how “both colonies and metropolises shared in the dialectics of [cultural] inclusion and exclusion, and in what ways the colonial domain was distinct from the metropolitan one” (p. 3). The authors’ purpose is to explore how in “the shared but differentiated space of empire...hierarchies of production, power, and knowledge” were shaped, paradoxically, against the backdrop of universalist ideologies such as liberalism, democracy, and human rights. A theme running through the book is the conventional postmodern polemic against “binary oppositions,” including those between ruler and ruled, white and black, and “active” metropole and “passive” colony. Things were and are complicated, not “Manichaeic.” Another theme is the argument that universalist Enlightenment ideologies themselves bore much of the blame for the exclusions and violence perpetrated in the colonies. Also, of course, it is argued that the colonized had agency, resisted but participated in their own subjection, and that colonial cultures, instead of being purely passive, influenced metropolitan cultures to some degree. (The metropolises defined themselves in relation to the Other, etc.) In sum, the book is devoted to “deconstructing” supposed “meta-narratives.” Its strengths and weaknesses are those of postmodernism in general.

The weaknesses are on full display in the introductory essay, which surveys postcolonial scholarship. The authors insist, rightly, on the complexity of the issues and the importance of subjectivity and particularity -- such insistence is the main strength of all postmodernism -- but aside from this, one is hard-pressed to find strengths. First of all, the chapter and the book, like most postmodernist “texts,” fluctuate between hyper-particularity and hyper-abstractness, never finding a middle ground. Furthermore, the abstractions tend to be either truisms or oversimplifications. Consider some examples: “Colonial regimes were neither monolithic nor omnipotent. Closer investigation reveals competing agendas for using power, competing strategies for maintaining control, and doubts about the legitimacy of the venture” (p. 6). That’s a truism, totally uncontroversial but presented as if it is an important insight. (When has power ever been monolithic or omnipotent? Who has ever thought it was?) “What is striking is how much the consolidation of bourgeois power at home and abroad drew on a polyvalent discourse of civility that emphasized different criteria for its measure and at different moments could move state policy in opposite directions” (p. 10). Truism. “Focus on the contingencies and contradictions of colonial rule emphasizes that political possibilities do not just lie in grand oppositions but in the interstices of power structures, in the intersection of particular agendas, in the political spaces opened by new and renewed discourses and by subtle shifts in ideological ground” (p. 18). Truism. Nothing interesting there. “As we have shown, the colonial situation was characterized by alternative projects and by the displacement and failure of such projects in colonial encounters: such processes did not begin or end with decolonization. Meanings of institutions, bureaucratic habits, and cultural styles set up in the colonial era were continually being reshaped” (p. 33). Truism.

The authors also tend to oversimplify or uncharitably characterize opposing positions. World systems theory, for example, argues that “colonization was one aspect of the development of a capitalist world system, through which the ‘core’ allocated itself the more complex and lucrative productive processes....and the ‘periphery’ was allocated the task of producing primary commodities through slavery or coerced cash crop production” (p. 19). The authors criticize the theory for ignoring “agency” -- but that’s silly, because obviously when one is analyzing the entire world economy one cannot pay close attention to the agency of some village in Senegal or some protest movement in Ecuador. “The theory’s assumption of passivity within colonial economies,” they write, “has been amply refuted by research in different parts of the world.” It is hardly a profound discovery that people in India were not, after all, rocks, passively letting colonizers do whatever they wanted to them. But unquestionably the colonized were *more* passive (victimized) than the colonizers; this is all that world systems theory is committed to. --And yes, it’s true that by saying “colonized vs. colonizers” here I’m positing a “Manichaeic” dichotomy, a “binary opposition,” but, again, in order to *talk*, or to explain anything at all, one has to make simplifying assumptions that abstract from the infinite complexities of lived experience while grasping essential

features. This is how science proceeds, for example. If one brought postmodernist hyper-particularity and methodological qualms into the natural sciences, nothing would ever get done.

The second chapter, written by Uday Mehta, titled “Liberal Strategies of Exclusion,” illustrates another typical fault of postmodernism: excessive idealism, i.e. the attribution of more “agency” to ideas (or discourses, etc.) than to institutions or people.¹ Mehta is puzzled by the historical contrast between “the inclusionary pretensions of liberal theory and the exclusionary effects of liberal practices” (p. 59). “One needs to account for how a set of ideas that professed, at a fundamental level, to include as their political referent a universal constituency nevertheless spawned practices that were either predicated on or directed at the political marginalization of various people. More specifically, one must consider if the exclusionary thrust of liberal history stems from the misapprehension of the generative basis of liberal universalism or if in contrast liberal history projects with greater focus and onto a larger canvas the theoretically veiled and qualified truth of liberal universalism.” It is as if Marxism never happened.² Let’s leave aside the bad writing and unnecessary jargon. The point is that Mehta blames *practices* on *ideas*: a set of ideas “spawned practices.” We’re back to Hegel, but without the profundity. In reality, of course, it is practices and institutional dynamics -- people’s material interests, the interests of power-structures, etc. -- that spawn ideas, or at least determine what kind of rhetoric and ideologies predominate in a given society. If the liberalism of John Stuart Mill’s day tolerated colonialism and various political exclusions, that isn’t because liberalism itself is somehow “necessarily” exclusionary; it is because intellectuals and power-elites consciously or unconsciously accommodated themselves to the interests of powerful institutions. Indeed, a much stronger case can be made that “true” liberalism, uncompromised by acquiescence to the interests of power-structures, is committed to the freedom and rights of all people, their right to control their economic, social, and political lives. Certainly classical liberals like Wilhelm von Humboldt would find much more to like in a Noam Chomsky than in a Friedrich Hayek, or any other apologist for the powerful.

The rest of the essays in the book are uneven in their quality, although they do, at least, show careful scholarship. They analyze conditions in colonies from Southeast Asia to sub-Saharan Africa, subtly investigating the dilemmas and paradoxes of racial, class, and gender identities among Europeans, Creoles, and natives. One is uncertain, however, what conclusions to draw from them, except that....things were complicated. Identities and cultures, not surprisingly, are full of tensions and “contestations.” The authors investigate in bewildering detail all the permutations of these contestations. After reading for several hours, one closes the book and thinks, “Wow, cultures sure have been contested.” Aside from that, specialists and antiquarians would find much of interest in this anthology.

It is customary to think of the Great War as having caused a major rupture in European history, as having ended the nineteenth century and begun the twentieth. In culture, it brought about the triumph of modernism and the banishing of tradition, of romanticism, of all comforting myths, religious images and ideas, “sentimental” devices for reconciling oneself with life’s tragedy and absurdity. Instead there was now Dada, abstraction, surrealism, James Joyce, Picasso, *The Waste Land*. A complete rupture. Jay Winter rejects this conventional understanding in *Sites of Memory, Sites of Mourning: The Great War in European Cultural History* (1995), arguing that “the rupture of 1914-18 was much less complete than previous scholars have suggested” (p. 3). The “modern” and the “traditional” overlapped and intermixed during the war and afterwards; artists in all media drew on traditional and popular ideas and forms in order to cope with the horrors of the war. Indeed, according to Winter it was the “universality of bereavement” that explained “the enduring appeal of many traditional motifs -- defined as an eclectic set of classical, romantic, and religious images and ideas” (p. 5). Pure modernism, with its paradoxes, ironies, abstractions, pre-postmodernisms, could express despair and anger, but it could not heal. “The strength of what may be termed ‘traditional’ forms in social and cultural life, in art, poetry, and ritual, lay in their power to mediate bereavement” (ibid.). Winter therefore structures his argument around analysis of how the dead of the Great

¹ This fault is ironic, because in other contexts postmodernists are obsessed with glorifying people’s agency.

² Appropriately, Mehta begins his essay with an epigram from Hegel.

War were mourned, in art, poetry, and social practices. It is here that we see clearly the persistence of tradition.

For example, among mourners, between strangers, arose powerful bonds of “fictive kinship,” of community and even surrogate family. Groups were organized to help widows and children; bonds were forged between the wounded and disabled; Catholic priests sponsored housing projects for poor families; the Red Cross gave information and support to local communities worried about their missing sons. There is nothing particularly “modern” about any of this. In fact, Winter goes so far as to say that the Great War “triggered an avalanche of the ‘unmodern’” (p. 54). Spiritualism, for instance, surged during the war, carrying “much of the Victorian temperament” into the war period and beyond. Numberless people participated in séances to speak to fallen soldiers; belief in the paranormal was widespread even among the most educated, including modernist artists. Spiritualism was reflected also in artists’ fascination with the satanic and the Biblical, and in millions of soldiers’ beliefs in supernatural tales (understandable given the hellish, surreal nature of trench warfare). In these and other respects, the Great War actually had a conservative effect on European culture.

In the realm specifically of art, popular culture of course evinced strong connections to the art of earlier periods. In Germany, Hindenburg was immortalized in towering statues just as Marlborough and other military heroes had been in the past. Artists and sculptors of war memorials, too, drew on earlier traditions, in particular late-nineteenth-century funerary art. In religious art, for example, Michelangelo’s Pietà frequently served as inspiration -- the dead soldier lying in his mother’s arms. Films provide many examples of “the twentieth-century revival of popular romanticism” (p. 142). Regarding painting and literature, Winter gives dozens of examples of traditionalism, many involving the use of apocalyptic images, which have a long history in religious and artistic contexts. In fact, it can be argued that “the Great War was, in cultural terms, the last nineteenth-century war, in that it provoked an outpouring of literature touching on an ancient set of beliefs about revelation, divine justice, and the nature of catastrophe” (p. 178).

All this is fairly persuasive. The culture of the Great War clearly was not a “complete rupture” with the past, nor did modernism “neatly and surgically” leave behind conventions from religious, romantic, and classical traditions. But these statements, after all, should not be controversial. They’re truisms. There are no clean breaks in history. *Sites of Memory, Sites of Mourning* is a good book, but after reading the introduction I was ready to concede the author his main points. The world is complicated, yes, and the “traditional/modern” divide, if taken too literally, can be misleading. One has to treat “binary opposites” with caution.

On the other hand, some of Winter’s arguments fall flat. It’s possible, in fact, that, while he has hit upon some truths, his thesis is fundamentally misguided in taking the persistence of classical, romantic, and religious forms and images as evidence of genuine “continuity.” His artistic imagination has failed him. In the 1973 Norton Lectures at Harvard, Leonard Bernstein drew the exact opposite conclusion from Winter with regard to the obvious persistence of traditional artistic forms in the twentieth century: he concluded that it illustrated, ironically, our century’s *separation* from tradition, its agonizing consciousness of being different from, and more anguished than, the past. Even the most modernist of artists, such as T. S. Eliot and Igor Stravinsky, used classical forms and images, not because there was any substantive “continuity” between them and the classical past but because, as modern men, they had become too self-conscious, too anxiety-ridden (reflecting their society), to express emotions *directly, unmediatedly, sincerely* and *subjectively*, as was once done. According to Bernstein, neoclassicism was a “security blanket for the whole literary world to clutch at in its sudden death-ridden distress” (Norton Lectures). “Hiding behind the mask of *once* directly expressed emotion -- that is the beginning and essential meaning of neoclassicism.” But the general idea is not limited to neoclassicism: the point is that, while old images and ideas to some extent persisted, their social and psychological content had, arguably, changed. Even the most seemingly conservative reactions, such as the revivifying of spiritualism, can be understood as symptomatic precisely of modernity’s *shock*, its being shocked out of the old Victorian complacency. There was cultural chaos going on with the Great War and afterwards, flailing around for meanings, for proper forms of artistic expression, for ways to cope with the horrors and uncertainties and anxieties of societal death and decades-protracted birth -- hence the desperate grasping at spiritualism, at apocalyptic imagery, Biblical, satanic,

romantic imagery. Only after World War II, as Winter notes, would all this turning-towards-the-past-to-cope-with-the-present be left behind, as the old society was finally annihilated -- World War I being the first act in the final drama.

Nonetheless, Winter is right that the drama played out slowly, not in a sudden triumphant explosion of modernism and destruction of tradition around the time of the Great War. History happens slowly. Not a very contentious thesis, but worth remembering anyway.

It is a curious thing that an event as consequential as the Russian Revolution, which ultimately determined the destinies of hundreds of millions, can depend in large part on a few personalities and a lot of luck. This is the inescapable conclusion of *A People's Tragedy: The Russian Revolution, 1891-1924* (1996), by Orlando Figes. There was no "iron necessity of history" or unstoppable Marxian dialectic leading to Lenin's revolution of October, 1917; there was contingency, free will, incompetence from some and reckless daring from others. It was anything but a true Marxist social revolution (of which there are no examples in history). Had Nicholas II not been so desperately stupid for twenty years, or Generals Evert and Kuropatkin not so incompetent in June, 1916, or Kerensky not so reluctant to take action against the Bolsheviks in the months before their coup d'état, or Lenin not so determined to seize power *exactly* when he did, or had V. N. Lvov's machinations not led to the misunderstandings that eventually got General Kornilov arrested in August, and had a thousand other such accidents not happened, it is quite possible that the course of the twentieth century would have been very different. That is probably the main lesson of Figes' book. But the book is so comprehensive, evenhanded, and engaging, being a narrative history that fuses social and political analysis with an abundance of vignettes and personal sketches, that much else can be gleaned from it than merely the historical importance of contingency.

For example, *irony* leaps from its pages: the reader is reminded that ubiquitous irony is perhaps the only "iron law" of history. For it is ironic that the Bolsheviks' total misinterpretations of the significance of their acts -- thinking they were establishing socialism or enacting a Marxist revolution when in fact what they were doing and creating was virtually the opposite of Marxism and socialism¹ -- in a sense *confirmed* a basic tenet of Marxism, that "consciousness" is of secondary importance compared to "social being." The intellectuals and politicians who rise to the top are those useful to the power-strivings of some group or groups in society, be they economic power-structures (business, the landed aristocracy) or some broad section of "the people." Whatever the subtle meanings of these intellectuals' elaborate doctrines or however they interpret their own actions, as long as they shout, for example, slogans like "All power to the Soviets!" or "Peace, land, bread!", and the circumstances are right, they will rise to the top. Naturally they'll interpret their success as proof of their theories, but really it could be, and probably is, nothing of the kind. Marx himself was a victim of this sort of self-delusion, in that the increasing popularity of his ideas late in life did not mean at all what he thought it did, that capitalism was approaching collapse. The ideas of his that became popular were merely fine expressions of the grievances of workers and gave them useful theoretical legitimation. That's all. If capitalism does eventually collapse, it certainly won't be in the way he predicted.²

Figes is right that Lenin was a product at least as much of the distinctive Russian revolutionary tradition (Chernyshevsky, etc.) as of Marxism -- and that he therefore departed from Marxism whenever he found it useful. The following passage is insightful:

All the main components of Lenin's doctrine -- the stress on the need for a disciplined revolutionary vanguard; the belief that action (the "subjective factor") could alter the objective course of history (and in particular that seizure of the state apparatus could bring about a social revolution); his defense of Jacobin methods of dictatorship; his contempt for

¹ "Socialism" means workers' power, and that was exactly what Lenin, despite himself, was effectively fighting against by creating a bureaucratic, terroristic, authoritarian state. Similarly, a revolution that relies essentially on peasant support is not a Marxist, or "post-capitalist," revolution. It is more like an anti-feudal revolution.

² See Chris Wright, *Worker Cooperatives and Revolution: History and Possibilities in the United States* (2010), at <http://scholarworks.umb.edu/masterstheses/19/>.

liberals and democrats (and indeed for socialists who compromised with them) -- all these stemmed not so much from Marx as from the Russian revolutionary tradition. Lenin used the ideas of Chernyshevsky, Nechaev, [etc.]...to inject a distinctly Russian dose of conspiratorial politics into a Marxist dialectic that would otherwise have remained passive -- content to wait for the revolution to mature through the development of objective conditions rather than eager to bring it about through political action. It was not Marxism that made Lenin a revolutionary but Lenin who made Marxism revolutionary (pp. 145, 146).

As I argue in the work cited above, an authentic, “*dialectical*” Marxism would be “evolutionary,” not “revolutionary.” It would also repudiate the idea that “a revolution could ‘jump over’ the contingencies of history” (p. 812). As Figes says, Bolshevism’s embrace of this idea “placed it firmly in the Russian messianic tradition,” not the Marxist tradition. In this respect, as in most others, the Mensheviks were more Marxist than the Bolsheviks.

What Russia’s revolutionary period at the beginning of the twentieth century really was was a *bourgeois* revolution that went off the rails. Its doing so wasn’t exactly “accidental,” although the way in which it did so was (more or less). In a gigantic country composed almost entirely of peasants filled with hatred for landowners and the government, a relatively smooth transition to industrial capitalism -- i.e. a transition not disturbed for decades, say, by peasant uprisings and revolutionary demagoguery, or even by a “socialist” takeover of the state -- would have been extremely difficult under the best of circumstances. Given the unstable state of Europe at the time, with its imperialism, nationalism, racism, international arms race, and class conflict, it was almost impossible. Even had Russia’s generals during World War I been competent enough to win the war, it is likely that in the following decade or two, perhaps during the Great Depression, massive peasant uprisings would have occurred, probably coinciding with strikes and demonstrations in the cities. The government might have been able to suppress them, or it might have succumbed to its own incompetence and let power slip to some future Lenin. One cannot say for sure. Maybe a future Stolypin would have managed the transition to capitalism with an iron hand. The point is that in primitive, predominantly rural countries like Russia, China, Italy and Spain in the early twentieth century, much of southern Asia around the same time, and so on, it is virtually a toss-up whether the transition to capitalism will bring to power a “leftist” government (Russia, China, Vietnam), a rightist government (Italy, Spain, China before Mao), or -- more rarely -- a centrist one (Italy and Spain before Mussolini and Franco). *That* is the meaning of the Russian revolution -- namely its lack of meaning.

Anyway, *A People’s Tragedy* is an excellent book, both entertaining and very informative. Most of the analysis that Figes offers is not terribly profound, but it shows common sense. For example, Figes’ conclusion is surely true: “It was the weakness of Russia’s democratic culture which enabled Bolshevism to take root. This was the legacy of Russian history, of centuries of serfdom and autocratic rule, that had kept the common people powerless and passive” (p. 808). True, but not very interesting. Nevertheless, as a narrative history of Russia’s revolutionary period, the book is probably unsurpassable.

Fascism is sometimes considered an enigma, due to its heterogeneity and mutability, but it is really rather simple. Its essence is just populist conservatism, or mass commitment to a cause that, whatever its followers might think of it, is “objectively” anti-egalitarian, anti-liberal, anti-democratic. If one wants to limit the concept to its classical European examples, one has to invoke ultra-nationalism, faith in a Leader, exaltation of violence, disgust with modern “decadence,” and other features; the more general definition just given, however -- not a full definition but only a description of the core -- accounts for the intuition that, say, popular enthusiasm for Ronald Reagan was reminiscent of fascism, or that the Ku Klux Klan was somewhat fascist, or that even movements like the contemporary Tea Party or Jerry Falwell’s Moral Majority are vaguely fascist. Whatever the rhetoric associated with them, these phenomena have been essentially anti-egalitarian. In his book *The Anatomy of Fascism* (2004), Robert Paxton, too, pays at least as much attention to classical fascists’ *acts* as to their *words*. Specifically, he charts a middle path between the extreme “intellectualism” of Zeev Sternhell (who is interested mostly in the intellectual progenitors of

fascism) and the extreme Marxism of someone like Daniel Guérin, who considers fascism mostly from the perspective of its usefulness to big business. Paxton also sensibly rejects the Sternhellian contention that the “essence” of fascism is genuinely revolutionary and has as much intellectual content and coherence as liberalism and socialism. Rather, it is more like a “mood” -- popular anti-democracy -- than a fixed ideology with a set program. In short, *The Anatomy of Fascism* is a lucid, thought-provoking work.

For example, the survey from pages 77 to 81 of common explanations of fascism’s “taking root” when and where it did is tantalizing (partly due to its brevity). The virus originated in the “crisis of the liberal order,” and it grew most virulent in countries of weak or failed liberalism, such as Germany and Italy (as opposed to France and Britain). But what caused this crisis? It was most severe in countries that had industrialized late and so suffered from more social tensions than Britain, for example. “For one thing, the pace [of industrialization] was much faster for the latecomers; for another, labor was by then much more powerfully organized” (p. 79). Marxists have accordingly argued that in many nations the economic system could “no longer function without reinforced discipline of the working class and/or a forceful conquest of external resources and markets” (ibid.). Whether or not this is true, Paxton is surely right that fascism presented conservative elites in late-industrializing countries with new methods of social control, methods harnessing the power of public-relations techniques that had become essential in an age of mass politics.

According to another interpretation that similarly focuses on the pitfalls of transition to an industrial modern society, certain countries had a social structure that was too heterogeneous, “divided between pre-industrial groups that had not yet disappeared -- artisans, great landowners, rentiers [and peasants] -- alongside new industrial managerial and working classes. Where the pre-industrial middle class was particularly powerful, according to this reading of the crisis of the liberal state, it could block peaceful settlement of industrial issues, and could provide manpower to fascism in order to save the privileges and prestige of the old social order” (ibid.). In the context of this interpretation, one is reminded that support from the peasantry was key to fascists’ success, since they reached out to peasants and farmers who often considered their economic interests opposed to those of industrial workers and felt ignored or even harmed by workers’ parties (with their demand for cheap food, etc.). Societies that became fascist were thus stuck between the legacies of feudalism and a not-fully-realized industrial capitalism.

One might also consider fascism an early phase in the mature statist period of European history. There is a logic to the sequence: as big business and industry increased in size and power from the late nineteenth century on, the state had to grow in order to regulate and stabilize a society that was ever more plagued with social tensions. As the state’s power grew, nationalist ideologies would naturally spread, especially because they legitimized power-structures and diverted attention from class conflict. They helped keep the masses under control. If in times of social or economic crisis certain states became deadlocked or ceased to function properly due to extreme polarization between radicals and conservatives (or between workers, peasants, landowners, petty bourgeois, big capitalists, and the “new” middle class), ultra-nationalism would probably conquer unprecedented political terrain, since it has the advantage of not being *a priori* committed to any particular set of social and economic doctrines but rather allowing anyone to fill it in with whatever social content he desires. It could mean one thing to landowners, another to peasants, another to big industrialists, and another to the petty bourgeois, such that it would attract more widespread support than, say, Communism, an ideology catering only to one class. Whether an ultra-nationalist party came to power in a given country would depend on circumstances and personalities, but there would be strong pressures for it to do so if the existing government was no longer functioning. In any case, the continent-wide environment of vicious nationalism would eventually impel many governments, especially the weaker or non-functioning ones, towards nationalist extremism, i.e., some version of fascism. Said differently, in order to solve the social crisis, a strong state would have to come about sooner or later.¹ And in an atmosphere of ultra-nationalism, such a state might very well have affinities with a fascist regime.

We can continue the thought-experiment: what would happen next? There are many possibilities, but the one certainty is that a continent could not remain forever boiling with nationalism and having a few

¹ Alternatively, the government would succumb to revolution -- but even then a strong state would probably emerge afterwards, as it did in Russia during the 1920s.

fascist or semi-fascist states. The situation would have to end eventually, either in a whimper, with the ultra-nationalism and fascism just dying out somehow, or, more probably, in a bang, with a cataclysmic war.¹ In either case, the result would be a more benign, *stable* form of statism. States would find, would *have* to find (in order to prevent societal destruction), a way to keep the extreme social and economic regulation while shedding the virulent nationalism. This, of course, is what happened after World War II. A new phase of European statism began, a more “technocratic,” less “ideological” (nationalist) phase.

In any event, the fact that these speculations have been inspired by Paxton’s book proves its fruitfulness. It is perhaps a bit too cursory in parts, such as in its survey of the many interpretations that have been offered of fascism’s origins, but that is probably an unavoidable fault in a work that aims to be a brief and readable overview of an immensely rich subject.

The history of Europe after World War II is a big topic, but Tony Judt does an admirable job of relating it in *Postwar: A History of Europe Since 1945* (2005). Both the west and the east receive fairly comprehensive treatment, as Judt discusses politics, economics, society, popular culture, and intellectual life. The book is a narrative history and not an analytical one, but analysis is interspersed throughout -- as well as being stimulated in the reader’s own mind by the narrative’s sheer richness. The title itself contains implicit analysis, in that it claims that the legacies of the war fundamentally shaped Europe for sixty years (and are only now being transcended, as Judt suggests on page 10). This is the book’s underlying theme, but there are other less grandiose ones. In the following I will consider a few of these themes, since they are of intrinsic interest and raise the book above the level of being a mere “description of what happened.” *Postwar* indeed has flaws, such as its flippant and dismissive treatment of youth movements in the 1960s, but on the whole it is as thorough and evenhanded as can be hoped.

One of its themes is encapsulated in the observation that between 1914 and 1945, the old Europe of “overlapping languages, religions, communities and nations,” with cities such as Trieste, Vienna, and Sarajevo that were “truly multicultural societies *avant le mot*, where Catholics, Orthodox, Muslims, Jews and others lived in familiar juxtaposition” -- Judt quotes a Polish writer who refers to “the incredible, almost comical melting-pot of peoples and nationalities sizzling dangerously in the very heart of Europe” -- all this was “smashed into the dust” (pp. 8, 9). The catastrophes that occurred between 1914 and 1945 destroyed a civilization, and the Europe that emerged “had fewer loose ends. Thanks to war, occupation, boundary adjustments, expulsions and genocide, almost everybody now lived in their own country, among their own people.”² Europe after the Second World War and the decade of social reconstruction and economic development that followed was *cleaner*, so to speak, more coherent in its social structures and ethnic composition, than it had been earlier; most of the residues of feudalism, political absolutism, pre-modern petty-bourgeois production, and medieval “pre-nation-stateness” were gone. Evidently it was impossible for Europe to achieve stability without first achieving some kind of coherence in its civil society, a coherence that surely could not have been accomplished without upheavals similar to those that occurred in the decades following 1914. One can even interpret the unprecedentedly peaceful and integrated industrial-capitalist Western Europe of the 1950s -- or, by the 1990s, Europe in its totality -- as a culmination of five hundred years of transition from the economic, social, and political structures of the Middle Ages to those of full modernity, organized *stably* (or relatively so) around industrial capitalism.³ In retrospect it isn’t surprising that such an epic transformation, overturning class structures, social hierarchies, patterns of urbanization and agricultural organization, forms of religious worship, and establishing durable nation-states, would end in an orgy of violence, confusion, and group hatreds.

¹ Had Hitler not existed, it is quite possible that a European war would have happened anyway, in the 1930s, ’40s, or even, maybe, the ’50s. Fascist movements marched all over the continent in the 1930s.

² [Judt notes incisively that “At the conclusion of the First World War it was borders that were invented and adjusted, while people were on the whole left in place. After 1945 what happened was rather the opposite: with one major exception [viz., Poland] boundaries stayed broadly intact and people were moved instead.”]

³ [The word “culmination” makes that not a very good interpretation. It suggests teleology and finality. In reality, of course, Europe kept evolving after the 1950s, albeit relatively peacefully and stably -- until now!]

Judt also argues that Europe is now returning to its multicultural past in a different way, due to the influx in recent decades of immigrants from Africa, the Middle East, and Asia. This is probably true in a sense, but, fortunately, there are major differences between the past and the present. To whatever extent nationalism, racism, and xenophobia reappear nowadays, they cannot have the calamitous impact they had earlier, simply because the world is much more integrated than it was in the 1930s and before. Nation-states are on the decline, being slowly torn apart by international networks of capital accumulation and the social atomization and class polarization that neoliberal hegemony has engendered. Moreover, civil society remains far more coherent than it was a hundred years ago, such that in times of social crisis, simple class issues, transnational in scope, will be less easily eclipsed by ethnic, racial, religious, or nationalist confusions than they were in the past. All these things give one cause to hope.

Another theme of *Postwar* is that “a 180-year cycle of ideological politics in Europe” drew to a close in the postwar era, specifically after the revolts of the Sixties (p. 449). This is less obviously true than the themes already mentioned, but there is at least *some* truth to it. As Judt states, “In 1945 the radical Right had discredited itself as a legitimate vehicle for political expression. By 1970, the radical Left was set fair to emulate it.” One can even argue that the relative “end of ideology” began in the 1950s, with the adoption by European and American elites of liberal-centrist technocratic management of society and the economy. Nonetheless, classical left ideologies did still have power to sway intellectuals and the masses, as the 1960s showed. Of course ideologies continued to exist even after the 1960s -- feminism, gay rights, environmentalism, a resurgent popular conservatism (much weaker than earlier nationalism), etc. -- but the old mass ideologies of the radical right and radical left seem to have exhausted themselves in Europe by the 1970s. “Single-issue voters” became common, as did a lack of political engagement by the masses (which began in the 1950s). It is true that radical left movements are on the rise again in 2011, but they have even less continuity with past traditions than the youth and workers’ movements of the Sixties did. It would seem that Europe’s older “180-year cycle of ideological politics” was a phenomenon of the transition from the *ancien régime* to a mature, “coherent” industrial capitalist society, while the contemporary upsurge of leftist movements all over the world is something new. Perhaps another transition to a different society, a post-capitalist one, is in the offing....

Such reflections would take us afield, however. One would like to comment on the book further, but space doesn’t permit. Not all the “themes” are very interesting anyway; for example, it isn’t terribly profound to argue that Europe has had a “complicated and frequently misunderstood relationship to the United States of America,” wanting it to be involved in its (Europe’s) affairs but resenting its involvement (p. 8). *Postwar* would have been even more interesting had Judt taken stands on historiographical issues -- or even mentioned any academic scholarship at all -- but, on the other hand, this would have made it less readable and layman-friendly. It is unquestionably a masterful book, despite whatever weaknesses scholars might find.

October, November, December

Reading Giovanni Arrighi’s *The Long Twentieth Century: Money, Power, and the Origins of Our Times* (1994) in my spare time. A wonderfully ambitious book, a study of “the two interdependent master processes of the [modern] era: the creation of a system of national states and the formation of a worldwide capitalist system.” In the preface he explains that one of his guiding ideas, borrowed from Fernand Braudel, is that “finance capital [as in the beginning and the end of the twentieth century] is not a particular stage of world capitalism, let alone its latest and highest stage. Rather, it is a recurrent phenomenon which has marked the capitalist era from its earliest beginnings in late medieval and early modern Europe. Throughout the capitalist era, financial expansions have signalled the transition from one regime of accumulation on a world scale to another. They are integral aspects of the recurrent destruction of ‘old’ regimes and the simultaneous creation of ‘new’ ones.”

He recognizes four successive “regimes of accumulation” or “systemic cycles of accumulation,” which he names after their geographic centers: Genoa, Holland, Britain, and the U.S. Four “long centuries.”

“What is compared in this book are the structures and processes of the capitalist world system as a whole at different stages of its development.”

So, there are long periods of “discontinuous change,” which end in “a reconstitution of the capitalist world-economy on new and enlarged foundations. Our investigation is aimed primarily at identifying the systemic conditions under which a new reconstitution of this kind may occur and, if it does occur, what it may look like.”

As he sees it, the Genoese cycle was from the 1400s to the early 1600s, the Dutch cycle from the late 1500s through most of the 1700s, the British cycle from the second half of the 1700s to the early 1900s, and the U.S. cycle from the late 1800s to the present.

He follows Marx and Braudel in saying that “what makes an agency or social stratum capitalist is not its predisposition to invest in a particular commodity (e.g. labor-power) or sphere of activity (e.g. industry). An agency is capitalist in virtue of the fact that its money is endowed with the ‘power of breeding’ (Marx’s expression) systematically and persistently, regardless of the nature of the particular commodities and activities that are incidentally the medium at any given time.” When the returns are high enough, capitalists invest in industry or commerce or whatever. If the returns in those spheres get too low, they prefer to invest in finance. Capital thus reverts to its money form and accumulates more directly, “as in Marx’s abridged formula MM' [as opposed to MCM'].”

“Capitalism” is therefore not synonymous with markets, nor even with a world market economy—which has existed, at least in a primitive form, since the Middle Ages or maybe much earlier. (Trade between Europe, China, India, the Islamic world, etc.) Rather, “Braudel [and Arrighi] sees capitalism as being absolutely dependent for its emergence and expansion on state power and as constituting the antithesis of the market economy.” The *antithesis!* Nice. (Maybe too strong a word, though.) More specifically, in Braudel’s conception there are three layers of the economy. “The lowest and until very recently broadest layer is that of an extremely elementary and mostly self-sufficient economy.” Peasants, I suppose, etc. Second is the market economy. Third is the zone of the “anti-market,” which is the real home of capitalism. In this zone, a fusion occurs between capital and state. Braudel:

Capitalism only triumphs when it becomes identified with the state, *when it is the state*. In its first great phase, that of the Italian city-states of Venice, Genoa, and Florence, power lay in the hands of the moneyed elite. In seventeenth-century Holland the aristocracy of the Regents governed for the benefit and even according to the directives of the businessmen, merchants, and money-lenders. Likewise, in England the Glorious Revolution of 1688 marked the accession of business similar to that in Holland.

Capitalists (merchants, etc.) have existed throughout the world for many centuries. Networks of trade, bankers, wholesalers, brokers. Only in Europe, though, did such elements coalesce into a truly capitalist system, in which capital essentially captured the state. So inter-state competition for mobile capital sprang up.

Let’s skip ahead to the first chapter. Interesting comments on the differences between the medieval and the modern political system. In the one case, interpenetration of jurisdictions—“plural allegiances,” “anomalous enclaves,” etc.—and ruling elites that could travel across the continent and govern wherever. A system that had “none of the connotations of possessiveness and exclusiveness conveyed by the modern concept of sovereignty.” Hence, quite different from the nation-state system.

One of the chapter’s themes is the contradiction between a “territorialist” logic of power and a capitalist logic of power. He proposes to answer three questions: (1) why Europe’s “unprecedented expansionism” began when it did, in the early modern period; (2) “why it proceeded unimpeded by the fall of one Western power after another, until almost the entire land surface of the earth had been conquered by peoples of European descent”; and (3) “whether and how the phenomenon has been related to the contemporaneous formation and equally explosive expansion of capitalism.” To answer these questions he has to consider the origins and development of the modern inter-state system, the critical feature of which “has been the constant opposition of the capitalist and territorialist logics of power and the recurrent

resolution of their contradictions through the reorganization of world political-economic space by the leading capitalist state of the epoch.”

The origins of the dialectic between capitalism and territorialism “lie in the formation within the medieval system of rule of a regional sub-system of capitalist city-states in northern Italy.” So this is what Arrighi looks at. The balance of power between Venice, Florence, Genoa, and Milan “anticipated by two centuries or more many of the key features of the modern inter-state system.” In fact, you could say that Europeans invented the modern state twice: first in the leading cities of the Italian Renaissance and second in the kingdoms north of the Alps.

In 15th-century Venice, for example, “the true prototype of the capitalist state,” a merchant capitalist oligarchy had firm control of the state, and undertook territorial acquisitions only if they could increase the profitability of the oligarchy’s operations. The four-city system prefigured the later nation-state system in the importance of the *balance of power* between the cities and also between the pope and the emperor. Indeed, capitalism couldn’t have developed as a system of rule without a balance of power between polities. (Or at least, that’s what history suggests.) Political fragmentation and power-balances. It’s fairly easy to think of reasons for this. Anyway, “the accumulation of capital from long-distance trade and high finance, the management of the balance of power, the commercialization of war [as in mercenaries], and the development of residential diplomacy thus complemented one another and, for a century or more, promoted an extraordinary concentration of wealth and power in the hands of the oligarchies that ruled the northern Italian city-states.” Early capitalism needed relative peace in order to thrive, etc.

Why did the medieval system of rule disintegrate? Many reasons. One of them: “the quantum leap in the European power struggle.” For example, new war-making techniques: “the Spanish *tercios*, professional standing armies, mobile siege cannons, new fortification systems.” New *productive forces*, that is. And of course the growth of international trade, urban areas, population, etc. From all this eventually you got the Reformation and then other democratic things, and the Thirty Years War, and the Scientific Revolution and the Enlightenment, and so forth. Capitalism as a world-system began in the mid-17th century with the modern inter-state system as enshrined in the Treaty of Westphalia. (No authorities above states, and civilians weren’t party to quarrels between sovereigns. Thus, international trade and capital accumulation could go on peacefully even when sovereigns were at war.) The Dutch were the main driving force behind the modern system, because they had taken Venice’s place as the dominant capitalist oligarchy on the continent. So their interest was in the absence of destructive wars and trade barriers—an interest they shared with the emerging dynastic states. “In pursuing its own interest, the Dutch capitalist oligarchy thus came to be perceived as the champion not just of independence from the central authorities of the medieval system of rule [viz., pope and emperor] but also of a general interest in peace which the latter were no longer able to serve.” That is, it became a *hegemonic* power. (Its particular interest was identified with the general interest.)

Dutch hegemony didn’t last long. The new system principally benefited France and England. French and British mercantilism brought about a synthesis of capitalism and territorialism by means of three “closely interrelated” components: settler colonialism, capitalist slavery, and economic nationalism. Etc., etc. This book doesn’t grab me, and anyway I have too much reading to do for my classes.

Reading J. A. Hobson’s classic *Imperialism: A Study* (1905). He focuses on Britain, asking: Wherefore imperialism? (The *new* imperialism, since the 1870s.) Concludes that it isn’t because of commercial benefits, giving a lot of statistics showing that trade with the colonies (imports and exports) is fairly marginal and hasn’t grown much since the 1880s. In fact, foreign trade as a whole, even with other industrialized countries—which contribute *much* more to it than the colonies—has been diminishing relative to the growth of the domestic market since the 1880s. And colonial trade has been diminishing relative to that with foreign countries. And of all colonial trade, that with the new possessions (in tropical regions) has been “the smallest, least progressive, and most fluctuating in quantity, while it is lowest in the character [i.e. quality] of the goods which it embraces.” So the new imperialism isn’t explained by its

commercial benefits to the British economy as a whole. Nor is it explained by the supposed need for an outlet for Britain's (nonexistent) surplus population.

So, why imperialism? "Seeing that the Imperialism of the last six decades is clearly condemned as a business policy, in that at enormous expense it has procured a small, bad, unsafe increase of markets, and has jeopardised the entire wealth of the nation in rousing the strong resentment of other nations, we may ask, 'How is the British nation induced to embark upon such unsound business?' The only possible answer is that the business interests of the nation as a whole are subordinated to those of certain sectional interests that usurp control of the national resources and use them for their private gain." Which are these interests? The answer isn't hard to find. "What is the direct economic outcome of Imperialism? A great expenditure of public money upon ships, guns, military and naval equipment and stores, growing and productive of enormous profits when a war, or an alarm of war, occurs; new public loans and important fluctuations in the home and foreign Bourses; more posts for soldiers and sailors and in the diplomatic and consular services; improvement of foreign investments by the substitution of the British flag for a foreign flag; acquisition of markets for certain classes of exports, and some protection and assistance for British trades in these manufactures; employment for engineers, missionaries, speculative miners, ranchers and other emigrants." It's pretty similar nowadays, with the "splendid little wars" America likes to provoke. (Politically connected industries, foreign investment, greater power for certain government bureaucracies that therefore have an interest in wars, chauvinism in the domestic population that allows power-structures to seize more power, etc.)

"By far the most important economic factor" is foreign investment. Officially, between 1884 and 1903 the income from such investment (in securities, railroads, etc.) rose from about 34,000,000 pounds to 64,000,000 pounds, although the real amount was probably 100,000,000. The "capital value" of these investments was probably at least 2,000,000,000 pounds. It is evident that "the income derived as interest upon foreign investments enormously exceeded that derived as profits upon ordinary export and import trade."

"It is not too much to say that the modern foreign policy of Great Britain has been primarily a struggle for profitable markets of investment. To a larger extent every year Great Britain has been becoming a nation living upon tribute from abroad, and the classes who enjoy this tribute have had an ever-increasing incentive to employ the public policy, the public purse, and the public force to extend the field of their private investments, and to safeguard and improve their existing investments.... Aggressive Imperialism, which costs the taxpayer so dear, which is of so little value to the manufacturer and trader, which is fraught with such grave incalculable peril to the citizen, is a source of great gain to the investor who cannot find at home the profitable use he seeks for his capital, and insists that his Government should help him to profitable and secure investments abroad." Wow, this book couldn't be more timely.

Aside from the investors, there are also the financiers, "the general dealers in investments." The great financial houses "use stocks and shares not so much as investments to yield them interest, but as material for speculation in the money market." These financial dealers, who coordinate enormous transfers of money, are "the gravest single factor in the economics of Imperialism." "To create new public debts, to float new companies, and to cause constant considerable fluctuations of values are three conditions of their profitable business. Each condition carries them into politics, and throws them on the side of Imperialism." J. P. Morgan, for instance, made millions off the Philippine war.

One of the grounds on which Hobson argues against imperialism is that protectionism, on which imperialism supposedly rests, is not a sound economic doctrine. If France shuts Algeria off from trade with Britain, Britain will still indirectly benefit from France's increased trade with its colony, since that stimulates economic activity that eventually gets around to interacting with the British economy. Thus, there is little reason for Britain to fight other countries for their colonies, especially given the expense of maintaining them and so on. Britain will profit regardless. I'm not sure this argument is wholly successful, though. For one thing, having captive markets and sources of raw material can surely benefit particular domestic industries, since it means they don't have to engage in price-competition with foreign companies. For *consumers*, on the other hand, I doubt that imperialism is good.

Actually, in the next chapter Hobson qualifies his previous argument. This is where his famous “underconsumptionism” comes in. Too much capital and too many goods (i.e., too much productive capacity); not enough investment opportunities and effective demand in the home market. Hence the need to look to foreign markets. Business concentration is the culprit: it leads to reduced utilization of capital and higher profits. (See Sweezy’s *Monopoly Capital* for details. I’m a little skeptical, or at least I’m reserving judgment.) “It was this sudden demand for foreign markets for manufactures and for investments which was avowedly responsible for the adoption [in the U.S.] of Imperialism as a political policy and practice by the Republican party to which the great industrial and financial chiefs belonged, and which belonged to them.” The reason companies couldn’t just use European markets for their surplus capital and goods is that tariffs against manufacturing imports prevented them.

Hobson’s conclusion intuitively seems true: if you prevent the super-rich from having excessive income, which they don’t spend as the less-rich would but unproductively *save* and/or invest abroad (or speculate with), and give all this income “to the workers in higher wages or to the community in taxes, so that it will be spent instead of being saved, serving in either of these ways to swell the tide of consumption—there will be no need to fight for foreign markets or foreign areas of investment.” [I.e., low domestic demand and excessive “surplus capital” lead to imperialism.] I think that makes sense. It seems to me that with a more egalitarian distribution of income—a healthier economy at home, with sky-high demand—imperialism and foreign adventurism à la McKinley and Bush would diminish. Or at least business would have less interest in it. In fact, that’s just a truism, isn’t it? In general, business has a reason to venture abroad only if the domestic market and domestic investment opportunities are insufficiently profitable. One major way to remedy that is to increase home demand. (Of course foreign trade and foreign investment would continue, but not to the same extent.)

Surely another way to prevent all this “fighting over markets” (and colonies) would have been to forbid hostile, counterproductive kinds of protectionism. The race for colonies had a lot to do with pressures from politically connected companies/industries that wanted raw materials, investment opportunities, and markets for finished goods. If England, say, got some colony first, well then German businesses were shut out of it. Hence the *race*. And the arms race, etc. Considering the lack of supranational bodies to regulate world trade and investment at the time, the *hostile* protectionist behavior of European countries was understandable; but from the perspective of national economies (as opposed to special industrial interests) it was unnecessary [Are you sure about that, Chris?], as shown by the post-World War II global economy. After 1945 (or thereabouts) there were international regulatory bodies and, especially, a gigantic superpower (the U.S.) that forced Europe to abandon most of its colonies and eventually oversaw the construction of a global regime of relatively free trade (or at least of less *hostile* protectionism).¹ And things worked pretty well, until foreign competition got too stiff and neoliberalism began. But the problems of foreign competition *this* time manifested themselves differently than they had around the turn of the century, in part because there wasn’t as much protectionism as before—and *no* protected colonies. This time there was no arms race [between countries whose industries competed against each other] and little vicious nationalism; instead, among other things, there was (is) greater suppression of workers’ rights in Western Europe than there was in the early 20th century, a rollback of the welfare state, and a search abroad for cheap *manufacturing* labor (a search made possible by new technologies, global integration of managerial hierarchies, etc.). The rise of business concentration in both periods is the same, though, as is the growth of financial capital. (The causes of the latter might be a little different now than in the past.)

¹ [There also emerged multinational corporations, many more than in the past, which militated against protectionism and colonization. As Anthony Brewer says, when there is an interpenetration of different national capitals (businesses or industries), “a struggle to enlarge one nation’s territory at the expense of others becomes economically pointless. To give an example, there would be no point in Ford or General Motors seeking to extend their markets by sponsoring U.S. annexation of parts of the EEC, when they are securely established in the European industry already. In the same way, tariff barriers between different markets become a hindrance rather than a benefit once multinational firms are well established.” (*Marxist Theories of Imperialism*, pp. 125, 126.) Actually, in an age of multinationals there can still be a lot of protectionism, though I suspect less than there was in, say, the first decade of the 20th century.]

[Regarding the U.S.'s forcing Europe to abandon its colonies after World War II, the economist Arthur MacEwan has this to say: "The current era of globalization was quite consciously planned by the U.S. government and U.S. business during and after World War II. They saw the United States replacing the British Empire as the dominant power among capitalist countries. But in place of 19th century-style colonial control, they looked to a 'free trade' regime to give U.S. firms access to resources and markets around the world. While U.S. business and the U.S. government did not achieve the 'free trade' goal immediately, this has been what they have promoted over the last 65 years." In other words, the free-trade version of imperialism, as opposed to the colonial version, could work only because it was in the interests of an overwhelming hegemon that could enforce it. There was no such hegemon between 1880 and 1945.]

....There are other interesting parallels between the past and the present. If I remember correctly, from the middle to the end of the 19th century Britain had a policy of free trade, opening its domestic markets to whomever. And from the middle to nearly the end of the 20th century, the U.S. basically had a policy of free trade. That changed with Reagan. In both cases, the intensification of foreign competition led to greater protectionism. And in both cases, *that* led to nationalism among much of the populace (through propaganda, etc.). But the U.S. couldn't help itself out by getting colonies this time because that era was over. Companies from around the world were forced to compete against each other, lowering prices and so on. (?) Which meant lower profits, more cost-cutting, lower demand, eventually the stagnant world economy of the present. Because (in part) no colonies! (Right?) I'm just "thinking aloud" here, so I don't know.... Did colonies in the past permit major industries not to cut costs as much as they have in recent decades, or as much as they would have otherwise, thus keeping demand relatively buoyant? Of course the Great Depression happened, but I don't know enough about that....

De jure colonies haven't been necessary, though, because manufacturing companies can get cheap labor now without having their governments politically control the country from which they're getting cheap labor.¹ In the past, Western governments had to wage war on places and install friendly governments and violently force the peasantry to work in mines or factories or wherever, because otherwise the "colonial" population would have just stayed in the countryside doing what it had been doing since time immemorial. Governments and companies had to *radically disrupt* things in order to profit off the land and the people. (And naturally the governments that went to the expense of disrupting wouldn't want to share the place with others; hence imperialist protectionism.) But that has been less necessary in the last thirty years, because the economic transformations have already more or less happened.² People in the global South need employment, so in order to get a labor force all that's necessary is to make sure a friendly government is there and go set up shop (through subsidiaries or subcontractors or whatever). Full-fledged colonialism is no longer a requirement for getting an obedient, cheap labor force or getting cheap access to raw materials. The South has been made pliantly capitalist, through the efforts of earlier Western savages.

Anyway, I don't know enough about the international economy of the past—or the present—to make detailed comparisons between the situation that led to the Great Depression and the situation that has led to the current proto-depression. But even in my ignorance I can see there are fascinating parallels and divergences. The most obvious is the presence for several decades of a hegemon whose free trade policies assist the rest of the "civilized" world in its industrialization—first in the second half of the 19th century, and then in the second half of the 20th century, when Europe and Japan had to reconstruct following World War II. The decline of stability has coincided with the relative decline of the hegemon. Earlier, as I said—after the 1870s—the consequences (of heightened foreign competition) were greater protectionism and the race for colonies, which were "surplus markets," sources of cheap raw materials and labor, and areas in which to invest excess capital. (Particular industries got their governments to act according to those industries' interests.) After the 1970s, the consequences, again, were greater protectionism—though less than in the past—and hunts all over the world for cheap labor [in *manufacturing* this time] and outlets for

¹ [But remember, Chris, that a hundred years ago such cheap labor was used mainly for *extraction of raw materials*, while now it is used also for *manufacturing*. That's the difference.]

² Actually, that's naïve. Western governments have officially operated at more of a remove than in the past, but essentially they've been almost as interventionist as always.

excess capital. It would seem, incidentally, that the search for foreign outlets for excess capital, both earlier and after the 1970s, is (unlike protectionism and the search for foreign cheap labor) a direct result not so much of foreign competition—which Hobson doesn't focus on—as of the phenomena Hobson discusses, low demand and few investment opportunities in the domestic economy. But low demand is itself in part a result of heightened foreign competition leading to cost-cutting. Probably business concentration plays a role too, as Hobson says, by diverting more money into the coffers of the rich, who spend less of it than the middle and lower classes would.

Economics is confusing.

Here are more timely ideas from Hobson:

The creation of public debts is a normal and a most imposing feature of Imperialism. Like Protection, it also serves a double purpose, not only furnishing a second means of escaping taxation upon income and property otherwise inevitable [in order to pay for imperialism], but providing a most useful form of investment for idle savings waiting for more profitable employment. The creation of large growing public debts is thus not only a necessary consequence of an imperialist expenditure too great for its current revenue, or of some sudden forced extortion of a war indemnity or other public penalty. It is a direct object of imperialist finance to create further debts, just as it is an object of the private money-lender to goad his clients into pecuniary difficulties in order that they may have recourse to him. [Think of the shenanigans of Wall Street in recent years, financial companies doing things detrimental to their clients.] Analysis of foreign investment shows that public or State-guaranteed debts are largely held by investors and financiers of other nations; and history shows, in the cases of Egypt, Turkey, China, the hand of the bondholder, and of the potential bondholder, in politics. This method of finance is not only profitable in the case of foreign nations, where it is a chief instrument or pretext for encroachment. [Think of all the hand-wringing in America over China's enormous dollar reserves.] It is of service to the financial classes to have a large national debt of their own. The floating of and the dealing in such public loans are a profitable business, and are means of exercising important political influences at critical junctures....

Imperialism with its wars and its armaments is undeniably responsible for the growing debts of the continental nations, and while the unparalleled industrial prosperity of Great Britain and the isolation of the United States have enabled these great nations to escape this ruinous competition during recent decades, both, committed as they seem to an Imperialism without limit, will succumb more and more to the moneylending classes dressed as Imperialists and patriots.

Welcome to the 21st century.

The rest of the book is less interesting, though very sensible. His predictions are far-sighted. Here's a short summary of some of his arguments, which, stated in this way, are obviously true:

The chief economic source of imperialism has been found in the inequality of industrial opportunities by which a favoured class accumulates superfluous elements of income which, in their search for profitable investments, press ever farther afield: the influence on State policy of these investors and their financial managers secures a national alliance of other vested interests which are threatened by movements of social reform: the adoption of Imperialism thus serves the double purpose of securing private material benefits for favoured classes of investors and traders at the public cost, while sustaining the general cause of conservatism by diverting public energy and interest from domestic agitation to external employment.

Reading Ernst Mayr's *This Is Biology: The Science of the Living World* (1997). I don't know enough about current issues in biology, and Mayr is a good source of information, being "one of the great figures of modern biology," as Chomsky has said. Early in the book, incidentally, he champions holism in biology, or emergence, or the philosophy of "organicism" as opposed to reductionism, which is a nice validation of my own proclivities as crudely expressed in my paper "Holism in the Sciences."¹

Here are my two final papers:

Causes of the Industrial Revolution: An Overview

Eric Hobsbawm did not exaggerate when he opined that "the Industrial Revolution marks the most fundamental transformation of human life in the history of the world recorded in written documents."² If one wants to understand the origins of modern society, one has to understand the origins of Britain's Industrial Revolution. Teasing apart the causal factors is no easy task, considering that one has to determine the roles of colonialism, international trade, American slavery, the Scientific Revolution, the Glorious Revolution, environmental factors, population growth, enclosures of farmland, low interest rates, war, and many other things. Nonetheless, in the last hundred years historians have clarified matters immensely, such that it now seems possible to understand at least in broad outlines the causes of Britain's industrialization. In this paper I will survey explanations put forward in four books published between 1948 and 2009: *The Industrial Revolution, 1760-1830* by T. S. Ashton (1948), *The First Industrial Revolution* by Phyllis Deane (1979), *Industry and Empire: From 1750 to the Present Day* by Eric Hobsbawm (1999), and *The British Industrial Revolution in Global Perspective* by Robert C. Allen (2009). Only the last is devoted solely to the question of what caused the Industrial Revolution and why it happened in Britain rather than elsewhere, but the others, written by important scholars, have much to say on the subject. Their explanations of Britain's great economic transformation are fascinating in their own right, but it is also of interest to observe the changes in scholarship over the last sixty years—the changes in emphases, in perspectives, and in scholarly sophistication.

One of the most obvious changes is embodied in Allen's use of the word "global" in his title. While earlier historians, such as Ashton, at least passingly mention events and conditions in non-European parts of the world, they do not emphasize them in the way that recent historians do. Indeed, this generalization applies across the historical discipline as a whole. Under the impetus of modern globalization, i.e. the worldwide impinging of economies, politics, and cultures upon each other, contemporary historians have inaugurated a "transnational" turn in scholarship, which rejects the parochialism of national histories in favor of histories that analyze cross-national social movements or anything else that doesn't respect national boundaries and sometimes tends even to undermine them. Allen's book does not quite reach this non-national level, being more like a comparative than a transnational history, but it is clearly influenced by these recent scholarly trends. Ashton's book, by contrast, is decidedly "un-international," i.e. Britain-focused.

It is also less sophisticated and conscientious in its scholarly trappings than Allen's, and recent historiography in general. In part this is because it is a brief overview of the entire Industrial Revolution. Even taking that into account, though, it is relatively "primitive," so to speak, lacking in citations and in the *cautiousness* when making judgments that recent scholarship evinces. It has a breezy confidence that is out

¹ In Mayr's most concise definition, organicism is "the belief that the unique characteristics of living organisms are due not to their [i.e. the organisms'] composition but rather to their organization." It originated in the first half of the 20th century as an alternative to both vitalism and "physicalism," two failed attempts at explicating the nature of life. For the organicist, emergence is an essential concept: "in a structured system [such as an organism], new properties emerge at higher levels of integration which could not have been predicted from a knowledge of the lower-level components.... By eventually incorporating the concepts of the genetic program [which is a distinguishing mark of all life] and of emergence, organicism became antireductionist [like vitalism but unlike physicalism] and yet remained mechanistic [like physicalism but unlike vitalism]." Organicism is widely accepted now.

² Eric Hobsbawm, *Industry and Empire: From 1750 to the Present Day* (New York: The New Press, 1999), xi.

of fashion in contemporary history-writing. Current historians have so much literature to consider that they tend to narrow their focus, avoid generalizations, and discuss myriad authors to demonstrate their knowledge. This makes their scholarship more reliable but also, sometimes, less readable. Their works are more “polished,” but there is a value in directness and “roughness” too.

For example, Ashton states flatly, “The outstanding feature of the social history of the period [between 1760 and 1830]—the thing that above all others distinguishes the age from its predecessors—is the rapid growth of population” in England and Wales (from six and half million in 1750 to fourteen million in 1831). What explains this growth? Not a rise in the birth rate; “it was a fall of mortality that led to the increase of numbers.”¹ What explains the fall of mortality?

The introduction of root crops made it possible to feed more cattle in the winter months, and so to supply fresh meat throughout the year. The substitution of wheat for inferior cereals, and an increased consumption of vegetables, strengthened resistance to disease. Higher standards of personal cleanliness, associated with more soap and cheaper cotton underwear, lessened the dangers of infection. The use of brick in place of timber in the walls, and of slate or stone instead of thatch in the roofs of cottages, reduced the number of pests.... The larger towns were paved, drained, and supplied with running water; knowledge of medicine and surgery developed; hospitals and dispensaries increased....²

This brevity and forcefulness contrast with Phyllis Deane’s lengthy and cautious discussion of the same topic. Ashton displays similar “breezy confidence” when asking what relationship population growth had to the development of industry. Was it a cause or an effect of the simultaneous economic changes? The obvious answer is “Both,” since a rising population made possible greater effective demand and was made possible by greater agricultural and industrial productivity. This is the answer Ashton seems to endorse when he quickly rejects both alternatives (cause or effect) in their one-sided opposition and concludes simply that alongside the population increase occurred an increase of productive land and capital, making possible a rise in the standard of living for most people.

So how does Ashton explain the Industrial Revolution? “If we seek—it would be wrong to do so—for a single reason why the pace of economic development quickened about the middle of the eighteenth century, it is to this [lowering of interest rates] we must look. The deep mines, solidly built factories, well-constructed canals, and substantial houses of the industrial revolution were the products of relatively cheap capital.”³ Low interest rates are not the only explanation he gives, but they have primacy. They resulted from the nationwide accumulation of savings, due largely to the fact that after the Glorious Revolution the ranks of the wealthy and middle class swelled and the rich got richer—and the rich have a higher propensity to save than spend. Thus, Britain’s supply of capital increased throughout the eighteenth century—as did that of labor, due in part to population growth.

Ashton also emphasizes a factor of whose importance recent scholars have come to doubt: enclosures. He argues that the agricultural revolution that supposedly happened in the eighteenth century, which improved the land’s productivity, was made possible in large part by “the creation of new units of administration in which the individual had more scope for experiment; and this meant the parcelling out and enclosure of the common fields, or the breaking up of the rough pasture and waste which had previously contributed little to the output of the village.” Enclosures had been going on for centuries; their importance, Ashton thinks, consisted in that they made it easier to bring about changes of method in farming. For example, enterprising landowners introduced four-course crop rotation, the growing of turnips, the Rotherham plow, the production of grain and cattle rather than of sheep, and cultivation by tenants on large-

¹ Hobsbawm contests this. See *ibid.*, 22. It may well be that both factors played a role: the birth rate rose and the death rate fell, at least for people of certain ages (infants, for example).

² T. S. Ashton, *The Industrial Revolution, 1760-1830* (Westport, CT: Greenwood Press, 1986), 4, 5. This is a reprint of the 1948 edition.

³ *Ibid.*, 9, 10.

scale holdings. Gradually, the horse was substituted for the ox, and wheat was grown instead of rye or oats. At the same time, Ashton thinks, enclosures drove many peasants off the land, “freeing” them to serve as industrial laborers. (He shares this belief with Karl Marx, although, being a conservative, he puts a positive spin on it.) All these processes facilitated the Industrial Revolution.¹

Among the other factors Ashton highlights are the dismantling of feudal regulations on economic activity in the seventeenth and eighteenth centuries, and the momentous improvements in means of transport that occurred between 1760 and 1830. He calls this the “canal era,” but roads too were vastly improved—both by the government and by wealthy individuals—greatly reducing the cost of transporting coal, iron, timber, and other heavy commodities.² He acknowledges the Scientific Revolution as laying the foundation for the many brilliant inventions that swept the land, from Hargreaves’ spinning jenny to Watt’s steam engine, but he denies that trade with non-European countries played a significant role in precipitating England’s economic transformations. The volume of such trade, he notes, was minor in comparison to the volume of trade with Europe. Ashton’s conservative liberalism is revealed in his celebration of individual entrepreneurs over monopolistic organizations like the East India Company, and in his virtual ignoring of colonialism and slavery as possible contributors to the Industrial Revolution.

Phyllis Deane’s *First Industrial Revolution*, being a synthesis of much scholarship, is less partisan on many points than Ashton’s book. Deane also revises some of Ashton’s emphases in the light of new empirical work. For example, while she agrees “there is no doubt that enclosure extended the area of productive land in England,” she is careful not to exaggerate the movement’s importance. In the late eighteenth and early nineteenth centuries, enclosure of millions of acres of common pasture and waste helped make possible the land’s ability to feed a rapidly growing population, but Deane refuses to take a stand on the question of enclosures’ responsibility for the introduction of “new techniques of large-scale farming, mechanization, stockbreeding, land drainage and scientific experiment.”³ More precisely, she thinks enclosure was a necessary but not a sufficient condition for introducing these techniques. She also is skeptical that enclosing lands released an army of laborers into urban areas where they could work for industrialists, in part because some of the new agricultural techniques required more, not less, labor. Still, she concedes that *some* surplus labor was released for use in industry. The agricultural revolution was also important, she argues, in providing much of the capital that was needed to finance industrialization and to keep it going through a long period of wars. It is significant that many of the funds that financed the Industrial Revolution came from landowners.

Deane gives much more attention to colonialism, slavery, and trade with non-European countries than Ashton does. English plantations in the West Indies had extended the range of commodities English merchants could sell to Europeans in exchange for foreign timber, silk for the textile trade, pitch and hemp for ships and buildings, high-grade iron for the metal trade, etc. Thus, West Indian products such as sugar, tobacco, cotton, indigo, and dyewoods, produced by slaves on plantations (and exchanged in the West Indies for captured Africans), allowed Britain to expand its international trade and accumulate capital with which to fund industry. (Raw cotton, too, was *directly* involved in Britain’s industrialization, as we’ll see momentarily.) International trade was also important in that it provided poor, less-developed countries with the purchasing power to buy British goods, and in its causing the growth of large towns and industrial centers. “It was the growth of really big towns like London, Liverpool, Manchester, Birmingham, and Glasgow that directly stimulated the large-scale investments in *transport* which were such an important feature of the early stages of the British industrial revolution.”⁴ All these towns, especially Liverpool and Glasgow, owed much of their growth to foreign trade.

Among other preconditions for industrialization were what Deane calls the “transport revolution” and the “demographic revolution,” but, having mentioned these already, we will proceed to the industry that sparked the explosion, viz. the cotton industry. Ashton places little emphasis on it, but Deane

¹ *Ibid.*, 18-21, 45.

² *Ibid.*, 59.

³ Phyllis Deane, *The First Industrial Revolution* (New York: Cambridge University Press, 1979), 44.

⁴ *Ibid.*, 71.

appreciates its significance. (The other early industry she considers almost as important was iron production.) One reason for the decisive role of cotton is that it used factors of production with which Britain was amply supplied. It was labor-intensive, for example, and the skills it required, such as the weaver's skill, were abundant. It also used the labor of women and children, which made for an extra-abundant and cheap labor force. Moreover, the demand for cotton was highly elastic; i.e., small changes in price had large effects on the quantity demanded. In addition, it helped that there was already a high demand for cotton goods made in India, which were of better quality than those from Britain. For these and other reasons, mechanical inventions in the late eighteenth century that permitted greater output of cotton at a cheaper price and with a higher quality were quickly adopted by industrialists. An epochal consequence of these inventions was that they made feasible and desirable the concentration of workers in large factories. Deane quotes W. W. Rostow on the long-term implications of the growth of the cotton industry: "Industrial enterprise on this scale had secondary reactions on the development of urban areas, the demand for coal, iron and machinery, the demand for working capital and ultimately the demand for cheap transport, which powerfully stimulated industrial development in other directions."¹

One can cull from Deane's book a list of miscellaneous other factors that led to the Industrial Revolution. The development of the steam-engine and the iron industry had major implications, both cost-saving and demand-increasing, for producers' goods industries in general. Abundant cheap labor "promoted new investment and so maintained technical progress which, by economizing in both capital and labour [and thus making possible higher profits even as prices fell], generated a cumulative self-reinforcing expansion in economic activity."² In the sphere of finance, Britain was lucky to have, by the mid-eighteenth century, the most sophisticated system of money and banking in Europe, which allowed capital to be efficiently directed to promising business ventures. It should be clear by now, in any case, that *The First Industrial Revolution* is, on the whole, a measured and fair overview of the main scholarly trends at the time of its writing. Its particular "slant," if it has one, is merely *synthesis*.

Eric Hobsbawm's *Industry and Empire* consists of synthesis as well, but it is not quite as "neutral" a book as Phyllis Deane's: Hobsbawm is a Marxist, so his interpretations tend to reflect that position. Nevertheless, so respectable and scholarly a historian is, naturally, broad-minded and not overly partisan. His book, being an economic and social history of Britain since 1750, has a much larger subject-matter than the question of what caused the Industrial Revolution, but his views on that topic are insightful and worth considering. Right away he states two things: first, that integral to British industrialization was the country's place in a world economy dominated by Europe; second—and here his Marxism is evident—that a satisfactory explanation cannot invoke only exogenous factors such as climate, geography, or biological change in the population, or only political conditions, or only historical accidents like the discovery of the Americas. All these explanations still leave open the question of why the revolution did not occur earlier, e.g. at the end of the seventeenth century, or in some other place in Europe that shared the particular property—such as large coal deposits—that supposedly gave Britain its advantage. Instead, we have to examine, first and foremost, the nature of Britain's economic conditions and institutions in the mid-eighteenth century.³

As it turns out, Britain in 1750 was well-prepared for industrialization. A landholding peasantry had already disappeared in much of England, as had subsistence agriculture. "The country was not merely a market economy—one in which the bulk of goods and services outside the family are bought and sold—but in many respects it formed a single national market. And it possessed an extensive and fairly highly developed manufacturing sector and an even more highly developed commercial apparatus."⁴ The average income probably increased substantially in the first half of the century, so that effective demand rose. Britain's domestic market therefore was gradually and stably expanding—and this stability proved important in years when foreign demand fluctuated wildly or collapsed. However, it was foreign demand,

¹ *Ibid.*, 94.

² *Ibid.*, 144.

³ Eric Hobsbawm, *Industry and Empire*, 13-16.

⁴ *Ibid.*, 17.

Hobsbawm argues, that provided the real spark for the Industrial Revolution. If anything, he emphasizes its role even more than Phyllis Deane does.

What explains the explosive expansiveness of Britain's export industries in the late eighteenth and early nineteenth centuries? Two things: the capture of other countries' export markets, and the destruction of domestic competition in particular countries. That is, war and colonization led to Britain's industrial development. This brings us to the third major factor Hobsbawm discusses (after the domestic and foreign markets): *government*. Britain was lucky in that its government, unlike France's, subordinated foreign policy entirely to economic interests. Its eventual control of nearly all Europe's overseas colonies thus proved of enormous economic benefit. Incidentally, the wars in which it won all these colonies contributed *directly* to technological innovation and industrialization by virtue of the government's demand for guns, ships, cannon, and other such iron-built items. The figures on colonial trade that Hobsbawm quotes are striking: in 1700, Britain's colonial trade constituted 15 percent of its total commerce; in 1775 it was about a third.

In short, "our [i.e., Britain's] industrial economy grew out of our commerce, and especially our commerce with the underdeveloped world." But what exactly explains that statement? Phyllis Deane has already given much of the answer: the cotton industry was integrally connected to international, and especially to colonial, commerce. Until 1770, Hobsbawm notes, over 90 percent of British cotton exports went to colonial markets, mainly Africa.¹ (Later on, India assumed immense importance.) At times in the eighteenth and nineteenth centuries cotton penetrated the markets of Europe and the U.S., but wars and native competition always ended that expansion of the industry, and it returned to some region of the undeveloped world. While in its day it was the best in the world, Hobsbawm is surely right that it was not competitive advantage that explained the preeminence of Britain's cotton industry but "a monopoly of the colonial and underdeveloped markets which the British Empire, the British Navy and British commercial supremacy gave it."²

On other matters, Hobsbawm dissents from the views of Ashton and Deane. For example, while they date the Industrial Revolution from about the 1760s, he dates it from the 1780s. One can argue, however, that the perennial debate among scholars over when exactly the revolution began and ended is not of much consequence. More substantive is the historians' disagreement over the importance of the iron industry during the first phase of industrialization. Deane and Ashton consider it to have been, even early on, of almost comparable importance to cotton, whereas Hobsbawm argues that, like coal, "it did not undergo its real industrial revolution until the middle decades of the nineteenth century, or about fifty years later than cotton; for while consumer goods industries possess a mass market even in pre-industrial economies, capital goods industries acquire such a market only in already industrializing or industrialized ones."³ (He does not deny, however, that far-reaching technical innovations occurred in the iron industry during the eighteenth century, such as the smelting of iron with coke instead of charcoal and the inventions of puddling and rolling.) On the question of whether low interest rates triggered the Industrial Revolution—which Ashton effectively answered in the affirmative—Hobsbawm follows Deane in not even dignifying it with an answer. This is one issue on which recent empirical research has apparently refuted traditional historiography.

With each of these authors we have observed ever-greater rigor, sophistication in scholarship, and reliance on empirical data,⁴ as well as greater emphasis on Britain's integration into the world economy. These trends are arguably taken further in Robert Allen's work *The British Industrial Revolution in Global Perspective*. Not only does Allen focus on the global context; he also incorporates the relatively new field

¹ Exports from Britain's somewhat backward cotton industry vastly expanded after 1750, giving the industry the impetus that culminated in its "industrialization" in the 1780s.

² *Ibid.*, 32, 36. His next sentence is, "Its [i.e., Britain's cotton industry's] days were numbered after the First World War, when the Indians, Chinese and Japanese manufactured or even exported their own cotton goods and could no longer be prevented from doing so by British political interference."

³ *Ibid.*, 49.

⁴ In a short paper we cannot convey the thoroughness with which Hobsbawm treats empirical records.

of environmental history. The main argument of his book is that the reason why industrialization happened in Britain rather than elsewhere was the unique combination of high wages (compared to other countries) and cheap energy. In China, for example, energy was expensive and labor was cheap, so it made no sense to use inventions like the steam engine and the coke blast furnace that substituted coal and capital for labor. That is, industrialization was *profitable* in Britain and unprofitable everywhere else; that is why it happened there. “The prices that governed these profitability considerations,” Allen argues, “were the result of Britain’s success in the global economy after 1500, so the Industrial Revolution can be seen as the sequel to that first phase of globalization.”¹

England’s high wages of the seventeenth and eighteenth centuries, a consequence of vigorous economic growth, were important also in that they ensured high levels of consumption and education, as manifested in literacy and numeracy. Likewise, they point to a pertinent difference between the England of 1750 and the England of 1450, which helps explain why the Industrial Revolution did not happen earlier despite the presence even then of relatively high wages: the Scientific Revolution had led to the “Industrial Enlightenment” of the eighteenth century (in addition to making possible new technology on the basis of insights relating to atmospheric pressure and time-keeping). As Joel Mokyr defines it, the Industrial Enlightenment was “that part of the Enlightenment that believed that material progress and economic growth could be achieved through increasing human knowledge of natural phenomena and making this knowledge accessible to those who could make use of it in production.”² By analyzing the biographies of 79 inventors of the eighteenth century, Allen shows that social and economic links existed between intellectuals and producers, “the *savants* and the *fabricants*,” indeed that the social circles of shopkeepers, proto-industrialists, artisans, and the wealthy were permeated by “scientific writers, tinkerers, engineers, lecturers, and experimental philosophers.” He thereby demonstrates the soundness and significance of Mokyr’s conception of the Industrial Enlightenment as contributing to the Industrial Revolution. More generally, the decline of superstition and rise of a scientific worldview seems to have been a precondition of Britain’s industrialization.

As stated above, environmental history has a major role in Allen’s book. He uses it to explain not only the course of the Industrial Revolution but also the success of England’s early modern economy. To summarize his argument very briefly, the Black Death of the mid-fourteenth century slashed England’s population. England’s comparative advantage had already been the production of wool, but with the post-plague reversion of millions of acres of arable land to pasture, sheep had more nutritious diets, which made their wool grow to greater length. Long wool was better suited to making worsted cloth, which was the material of the “new draperies” whose export benefited from the commercial revolution of early modern Europe. The very important export of draperies and other woollen fabrics caused London, their export point, to grow in the seventeenth century, and it continued to grow as trade with the Americas, Africa, and Asia expanded. London’s growth encouraged the rise of coal mining, and eventually the application of coal to more and more industrial technologies. “Metal refining and fabricating industries, among others, took off and provided a basis for economic development outside of London.” Given the presence of cheap coal in northern Britain, wages could rise rapidly in that region—ultimately converging with London levels—without hurting the international competitiveness of industries there. High wages meant high demand, which further stimulated economic growth. Allen sums it all up in one sentence: “The success of the British economy was, thus, due to long-haired sheep, cheap coal and the imperial foreign policy that secured a rising volume of trade.”³

Coal was important not only as a source of cheap energy but also for its “technological spin-offs,” the steam engine and the railway. Without the coal industry, after all, there would have been no point in inventing the steam engine—which by the late eighteenth century was used in cotton mills—and so

¹ Robert Allen, *The British Industrial Revolution in Global Perspective* (New York: Cambridge University Press, 2009), 2.

² Quoted in *ibid.*, 239.

³ *Ibid.*, 111, 130.

“scientific discoveries would not have flowered into the technology of the Industrial Revolution.”¹ The French invented technologies too, for example in paper production, but they were not as transformative as the steam engine and cheap iron. They did not lead to widespread mechanization and globalization. The difference between France and Britain, according to Allen’s rather simplified account, is just that the latter was luckier in its geology. Only after British engineers in the mid-nineteenth century had made the steam engine more fuel-efficient, so that it consumed less coal, did it become profitable for other countries with less abundant supplies of coal to use it—and they did so.

Allen also has much to say about the agricultural revolution. In the standard narrative, to which the other authors we have considered (including Hobsbawm) essentially subscribe, “enclosure of open fields and the replacement of peasant cultivation by capitalist farming” were largely responsible for the agricultural revolution, i.e. the revolution in the land’s productivity. “These changes,” Allen continues in his description of the narrative, “increased output and (in Marxist accounts) reduced farm employment. The extra output made it possible to feed a larger urban or proto-industrial population and so fostered the growth of manufacturing. Institutional change in the countryside caused the growth of the city and propelled the economy forward.”² Allen concedes there is some truth to this narrative, but he thinks causation ran more strongly in the opposite direction, from expansion of cities (resulting from international trade) to increased agricultural productivity. That is, the process involved more “pull” than “push.” In the seventeenth and eighteenth centuries, as the growth of international trade was precipitating the expansion of cities and improvements in the urban standard of living, farmers, whose incomes began to stagnate, felt left out of the economic boom. Many sold their land and moved to London, a process that facilitated the growth of large estates. Others invested in productivity improvements, whether by increasing crop and livestock yields or by farming with fewer people, which was done by “amalgamating small holdings into large farms and enclosing open field arable and converting it to pasture.”³ Both landlords and well-off farmers did this. — Notwithstanding these minor corrections to the standard narrative, it seems that the four authors we have reviewed agree on the fundamentals, that a revolution in agricultural productivity that coincided, at least in the long run, with depopulation of the countryside was an essential foundation of Britain’s Industrial Revolution.

A peculiar thing about that world-historic event is that no matter how much one studies it, there remains something mysterious about it. There are so many factors to take into consideration that true understanding always seems out of reach. In this short paper we have barely been able to gesture at such understanding, but at least we have seen how some of the historiography has evolved. It is true that the four books discussed here focus, perhaps a bit too much, on economic history, saying little about the cultural and intellectual context. This charge is least justified, however, with regard to *The British Industrial Revolution in Global Perspective*. As we have seen, Allen considers the Industrial Enlightenment to have been important in undermining a culture of superstition and exalting science instead; he is interested in the social and intellectual circles in which inventors moved. “Scientific lectures,” he notes, “were popular in eighteenth-century England, as were books explaining the discoveries of Newton and other natural philosophers. The hoi polloi became familiar with the discoveries of science and with the scientific worldview.... This worldview was conducive to the improvement of technology.”⁴ More than any of the other authors, Allen appreciates the positive lesson of postmodernism, that the cultural and intellectual environment influences what happens in society and even the economy. In fact, Allen’s book is an intriguing synthesis of technological history—he discusses in minute detail the functioning of the most significant inventions associated with the Industrial Revolution—economic history, environmental history, and cultural history. The latter is mostly ignored by the other three books, although Deane mentions “changes in entrepreneurial attitudes to innovation,” quoting Samuel Johnson’s sardonic comment that “The age is running mad after innovation. All the business of the world is to be done in a new way: men are to be

¹ Ibid., 157.

² Ibid., 78.

³ Ibid.

⁴ Ibid., 241.

hanged in a new way; Tyburn itself is not safe from the fury of innovation.”¹ Insofar as the three earlier authors (Ashton, Deane, and Hobsbawm) ignore the cultural and intellectual environment of Britain’s industrialization, that is surely a flaw in their works.

All four authors rely largely on secondary sources, although, again, this is least true of Allen, who uses many contemporary drawings of eighteenth-century inventions and quotations from writers of the day. Ashton’s and Deane’s books are introductions to the subject, so they make no apologies for relying on secondary sources; Hobsbawm’s is an introduction not only to the Industrial Revolution but to British economic history as a whole from 1750 to the present. The main difference between the four studies summarized here is probably their growing *comprehensiveness*, from Ashton’s little 1948 book (111 pages) to Allen’s incorporation of at least four different fields of study. In this sense, Allen’s is probably the best work to emulate—although Hobsbawm’s thorough familiarity with 250 years of history, as well as his writing style, are remarkable. In any event, after reading these four works and contemplating the path of historiography from the 1940s to the present, one is left with a sense of satisfaction at the state of historical scholarship today. It does not degenerate, as some things in human culture do; it ascends.

*Deskilling on the Disassembly Line: Technological Change and Its Consequences in
Beef-Packing Since the 1960s*

One way to interpret the economic history of the West, and even of much of the “Rest,” since the Second World War is in terms of the demise of the “proletariat” and rise of the “precariat.”² The latter concept has been invoked in recent years to refer to the billions of people worldwide who, as the economist Guy Standing says, “must survive through insecure jobs and unemployment, with insecure homes, without an occupational identity, with volatile wages, without company benefits and with fragile access to state benefits.” The precariat has been a product largely of the West’s neoliberal policies: flexible labor markets, retrenchment of the welfare state, repression of labor unions, offshoring of production, the shifting of the economy’s momentum into the service and financial sectors, in short the accumulation of ever-greater wealth and power in the hands of a tiny elite. In the age of the “Great Recession” and Occupy Wall Street—a movement occurring against the background of ballooning corporate profits—this diagnosis has become a truism. However, the state of affairs it describes presupposes and gives rise to something that is rarely explicitly mentioned: increasing automation and the systematic deskilling of work. By now we take these phenomena for granted, hardly even noticing them, but they condition modern life to such an extent that they deserve more attention from historians than they have received. In this paper I will outline the recent history of labor’s deskilling and its implications for workers in a single industry, or rather a sub-sector of one: beef-packing, especially work on the kill floor. Even in such labor-intensive work as this, mechanization and deskilling by one means or another have proceeded since the early 1950s. An indirect consequence has been the creation in the last thirty years of a meatpacking precariat, whose conditions of work and life are frequently miserable.³

It used to be thought that automation *increased* the skill requirements of workers, due to the necessity of handling sophisticated machinery. Harry Braverman demolished this argument in his classic *Labor and Monopoly Capital: The Degradation of Work in the Twentieth Century* (1974). Probably one needed only common sense, not tremendous Marxian sociological intelligence, to recognize the falseness

¹ Deane, *The First Industrial Revolution*, 123.

² [That is, first the proletariat gave way to the mass-unionized working class, which became, arguably, part of the middle class. Then this unionized workforce succumbed to neoliberalism, and the mass precariat emerged even in the West.]

³ “Guy Standing: ‘Precariat’ of Insecure Workers Is Stirring,” *The Cap Times*, November 6, 2011, http://host.madison.com/ct/news/opinion/column/article_54c036b6-123e-5917-b45f-82947a3133c8.html (accessed November, 2011); Yepoka Yeebo, “Corporate Profits At All-Time High As Recovery Stumbles,” *Huffington Post*, March 25, 2011, http://www.huffingtonpost.com/2011/03/25/corporate-profits-2011-all-time-high_n_840538.html.

of the argument; after all, an article in *LIFE Magazine* in 1963 reported an executive describing one of his machinists' jobs as follows: "All he has to do....is press the button to start the machine and then monitor it. All he has to know is what his machine looks like so he can find it when he comes to work." The machinist in question remarked that "the job gets boring. You spend most of your time loading it, rewinding the tape, and sometimes you spend 45 minutes just watching it." Nonetheless, Braverman performed a valuable service by placing automation in its historical context. As he interpreted it, it was essentially a continuation of Frederick Winslow Taylor's scientific management by other means, and so was but another stage in the capitalist's perennial project of wresting control of the labor process from the laborer. Moreover, Braverman saw automation as only one manifestation of the broader contemporary phenomenon of deskilling. He defined "deskilling" by reformulating several principles enunciated by Taylor.¹

The first principle, he says, is "the dissociation of the labor process from the skills of the workers. The labor process is to be rendered independent of craft, tradition, and the workers' knowledge. Henceforth it is to depend not at all upon the abilities of the workers, but entirely upon the practices of management." The second principle is that of "the separation of conception from execution." The worker is the "hand," management the brain. Braverman distinguishes this idea from the more common one of the separation of mental and manual labor, because "mental" labor, too, such as clerical and even managerial, becomes subject to the same differentiation between conception, or knowledge and planning, and execution. The third principle, which is perhaps redundant, is "the use of [management's] monopoly over knowledge to control each step of the labor process and its mode of execution." Ultimately the point of these principles, and of management itself, "was to render conscious and systematic, the formerly unconscious tendency of capitalist production. It was to ensure that as craft declined, the worker would sink to the level of general and undifferentiated labor power, adaptable to a large range of simple tasks, while as science grew, it would be concentrated in the hands of management."²

From this Marxian perspective, the modern "precariat" is not a surprising or even a new thing but a logical outcome of certain basic tendencies of capitalist production. Indeed, the classical proletariat was little else but an *industrial* precariat, characterized by insecure employment, terrible working conditions, low pay, etc. Over time it was integrated into the dominant social order by the agency of labor unions and the state (through welfare programs, economic regulation, Keynesian boosting of demand, and adjudication of disputes between capital and labor), but after the 1950s the so-called "capital-labor accord" began to unravel under the impact of intensified international and domestic competition between units of capital. That is, in order to compete it became increasingly necessary for businesses to cut costs, which entailed a stepping-up of their campaign to reduce workers' pay and autonomy. A return to precarious conditions of life for the latter ensued, but since "deindustrialization" was happening in the West, the new precariat was not principally an industrial one but existed also in the service sector—and has lately been extending into other sectors, such as real estate. A new "reserve army of labor" is growing, a global army of cast-off or intermittently employed workers whose labor power is, more or less, at a "general and undifferentiated" level. They are available to do whatever unskilled or semiskilled work appears, but much of the time they are forced to sit around and wait.³

Even in the U.S., however, many of them work in industry. Among these are the meatpacking workers. I chose to write this paper about them not only because—perhaps paradoxically—beef-packing is still rather labor-intensive, but also because analysis of an industry as fundamental to society as *meat* can reveal much about the society in question. Unfortunately, what meatpacking tells us about ourselves is not

pretty. The secrecy in which the industry is kept by its owners exists for a good reason: if consumers knew what goes on inside slaughterhouses, they might not want to eat meat.

While this paper draws on Braverman, I do not want to emphasize the negative aspects of technological change quite as much as he does. As a good Marxist, he would be the first to admit that technology itself is not the problem, or certainly not the main problem; it is the capitalist social relations, which use technology in a certain way, that are the “problem.” Many of the technologies mentioned in this paper, far from being bad for workers and consumers, are more sensibly seen as beneficial. In a particular social context, however, work-related technological advance can be either empowering or disempowering vis-à-vis workers; and in a capitalist context, the tendency is for it to be disempowering, often by eliminating the need for certain skills and so eliminating a crucial source of employees’ bargaining power. Accordingly, technological progress in recent decades has reinforced the policies of “neoliberalism” to produce a society that is hostile to labor and the labor movement.

The purpose of this paper is to survey the history of recent advances in mechanization on the beef kill floor and describe some of their repercussions for workers. I also try to give some context, so I do not ignore developments outside slaughtering—for instance, in processing the eviscerated and cooled carcass—or outside beef-packing. The scholarship suffers from a dearth of systematic discussions of technological advance in meatpacking. It is, admittedly, a dry subject, but it is surely an important one, considering the impact technology has had on workers and consumers.

Background

Aside from the railroad, the most important invention in the history of meatpacking was refrigeration. By the 1880s it was in widespread use; by the 1890s, mechanical refrigeration had, on the whole, superseded the use of natural ice. The epoch-making significance of refrigeration—in railroad cars, for example, which were used to transport meat—was not only that it made possible the rise of Chicago and the Midwest as centers of slaughtering and meat-distribution for the country and much of the world. It also led to a decline in demand for skilled butchers, since meat could now be cut up (at least partially) at central packing plants by mostly unskilled or semiskilled workers and distributed in refrigerated cars to distant markets. And because it made possible a year-round, as opposed to seasonal (wintertime), meatpacking industry, it heightened incentives for companies to invest in labor-saving and division-of-labor-increasing devices at slaughterhouses, thereby intensifying trends toward the deskilling of work.¹

Meatpacking was harder to mechanize than other large industries due to the heterogeneity of size, weight, and quality among cattle, hogs, and sheep. As a result, it was and is relatively labor-intensive—which has entailed low profit-margins, which in turn has entailed that companies drive their employees hard and fast in order to produce more output. This is why meatpacking was the first industry to use assembly-line production, which originated in Cincinnati’s pork packinghouses in the 1830s. The “assembly line” was quite primitive then: hogs were driven up to the top floor of the building, several stories high, where they were killed, after which their carcasses slid down an overhead wooden rail on hooks attached to rollers. Workers progressively disassembled them along the way. By the end of the nineteenth century, as historian James Barrett remarks, changes had come “in the extent of the division of labor, in the mechanical conveyance of the carcass, and in minor improvements like the substitution of steel for wood in the construction of the overhead rails.”²

Things were more complicated with cattle than hogs. While rails were widely used in the late nineteenth century (as they have been ever since), it took a long time to discover an efficient and relatively

humane way of killing and bleeding the large animals. A butcher who had worked in the Chicago Stock Yards in the 1870s and '80s later testified that in those early decades “There were various ways of dispatching the poor brutes. One was to spear them in the back of the neck, severing the spinal column and causing almost instant death. Another was to shoot them [with a rifle] from the top of the cattle pens. Still another way was to rope them and haul them down to a bull ring fastened in the floor, and then hit them with a sledgehammer in the forehead.” None of these methods was ideal. “Roping and knocking them with a hammer,” for example, “was too slow. It took up too much time....and when the cattle were ‘onery’ [sic] and wild often they would get out from the pen and cavort about the slaughterhouse, knocking down beef from the boxes and chasing the men hither and yon...” Eventually the system that is still in its essence used today spread widely, whereby, instead of killing and bleeding the animals on the floor, they were knocked unconscious with a hammer, hoisted up to the overhead rail, and bled by having their throats cut. By the turn of the century a “shackler” could hoist dozens of stunned cattle every minute by “simply clipping the shackle around the hind foot, while steam power does the rest” (according to an observer of the day).¹

In all industrial-scale slaughtering the overhead rail is crucial, since it allows the animal to be carried easily from worker to worker (or from team to team, as the case may be). However, until the early twentieth century the rail was not automated; instead, workers had to push the carcass by hand at various stages of the process. Only in 1908 did this change, with the introduction of an automatic conveyor system that used a moving overhead chain. In ending the need for manual power, the moving chain ended most of workers’ control over the pace of their work (although cattle carcasses still had to be removed from the rail in order to be skinned). The foreman used a lever to control the speed of the conveyor, hence the speed of work.²

These and other inventions, such as moving dressing tables (1908) and a machine to scrape off hogs’ hair (1876), already illustrate the morally and socially ambiguous character of technological progress and the deskilling of labor. On one hand, as David Brody notes, the ever-more-minute division of labor in meatpacking greatly improved the quality of delicate tasks, such as skinning and splitting (i.e., cutting the carcass down the middle). Output per man increased enormously: “in 1884, five splitters had handled eight hundred cattle in the course of a ten-hour workday; by 1894 four of them were handling twelve hundred.” Mechanization and the division of labor also made work easier inasmuch as they lowered skill requirements. On the other hand, by making possible inhuman work-paces, they made work more difficult and did little to improve its safety. They also, of course, deprived the worker of control over his labor and of the element of creativity and decision-making that had earlier given his tasks what charm they had.³

Between the 1910s and early 1950s, few important changes happened in the organization and technology of work. Especially in beef-packing, everything was done almost entirely by hand. Cattle climbed up a runway to the top floor of the packinghouse, where a “knocker” knocked them unconscious with a hammer. The shackler attached the overhead chain to the animal’s foot, so that the steer hung upside-down from the conveyor that carried it to lower levels in the plant. A “sticker” cut the animal’s throat, after which another worker beheaded it. The next step was to skin the carcass, which was done by lowering it onto the skinning bed and carefully cutting between the hide and the flesh. At the same time, butchers detached the legs at the knee joints. Midway through the hide-removal process the carcass was returned to the overhead chain, where the last stages of skinning took place. A series of butchers (“gut-snatchers,” “gutters,” etc.), helped by laborers, then proceeded to remove the viscera and drop them down a chute to the offal department below, after which splitters used long cleavers (later power saws) to split the backbone down the middle. Following a few more minor operations, laborers scrubbed the carcass with warm water, wiped it dry, and sent it to a government inspector. (By the 1910s there were often several inspectors at different stages of the line.) After being chilled for twenty-four to thirty-six hours in the cooler, the carcass

¹ *National Provisioner*, Vol. 2, July 4, 1981, 32-35; Barrett, *Work and Community in the Jungle*, 24.

² Barrett, *Work and Community in the Jungle*, 24, 25, 27; Donald Stull and Michael Broadway, *Slaughterhouse Blues: The Meat and Poultry Industry in North America* (Belmont, CA: Wadsworth, 2004), 34.

³ David Brody, *The Butcher Workmen: A Study of Unionization* (Cambridge, MA: Harvard University Press, 1964), 4; Barrett, *Work and Community in the Jungle*, 27.

was moved to the cutting and trimming departments, where its halves were cut in half before being shipped to butcher shops. Work continued in the offal rooms below the kill floor and in byproduct departments that processed everything from blood to brains to bones.¹

Until the early 1950s, the most important technical innovation in cattle-slaughtering was the adoption in the 1920s of powered knives and saws in lieu of cleavers, which, as historian Ian MacLachlan notes, “improved the cut quality of the carcass....[and] greatly reduced both the skill and strength required of a butcher equipped with a cleaver.” In addition to this, the method of stunning animals changed. By the 1940s, stunners no longer simply smashed a hammer onto the animal’s head, trying not to kill it. (Death would stop the heart and so prevent the rapid draining of blood.) Instead they adopted the relatively reliable and humane method of firing captive-bolt pistols, which use compressed air to shoot a bolt either into or onto the skull (forehead). With modifications, these guns are still in use today.²

Finally, after decades of incremental advance, a truly revolutionary innovation appeared: continuous on-the-rail dressing. First applied in 1951 by a Canadian firm called Canada Packers, this system of slaughtering cattle eliminated the need to take carcasses off the overhead rail for skinning. To quote MacLachlan, it ended the “exhausting stooping over prone carcasses by floorsmen, time lost in walking around carcasses on blood-slick floors, the danger of falling overhead trolleys, and the time loss and expense of raising, lowering, and re-raising carcasses.” With the help of raised benches, power saws, mechanical hide-pullers, hydraulic platforms that could be raised or lowered depending on the size of the carcass, and other new technologies, workers could disassemble an animal while the whole time it remained suspended from the rail. The result was faster line speeds, in some cases a doubling of production.³

Since the Can-Pak (for Canada Packers) system is still used today, let’s consider a few of its innovations. The disassembly process was still labor-intensive, but now workers could remain stationary, positioned at heights appropriate to their tasks as the carcass moved past them. After stunning and sticking, as the carcass hung from the moving rail by its left hind leg, workers used knives, power saws, and power shears to skin the right hind leg and lop off the three unencumbered feet. The next step was to transfer the carcass from the “bleeding rail,” where the animal was killed, to the “dressing rail,” where most of the skinning, cutting, sawing, eviscerating, splitting, trimming, and cleaning took place. The rail-to-rail transferring was accomplished by inserting a hook through the right hind shank in order to power-hoist the carcass to a trolley attached to the dressing rail. As the weight shifted to the right hind leg, the left could be unshackled and the carcass detached from the bleeding rail. The left hind leg was then hooked up to the dressing rail (like the right), skinned, and had its hoof cut off. Meanwhile a circle was cut around the anus, “freeing the sphincter from the surrounding hide,” as MacLachlan says. “A snug elastic o-ring, the size of a Cheerio, was used to cinch the rectum and avoid contamination of the carcass by intestinal contents.”⁴

Now that the carcass was hanging from the dressing rail by both hind legs, skinning could proceed in earnest. Workers conducted its initial stages, skinning the chest, abdomen, belly, and parts of the legs while standing on a moving hydraulic platform. After that, a mechanical hide-puller—a crucial part of the Can-Pak system—pulled the hide all the way down from the rump to the nose, thus removing it from the body. The rest of the dressing remained labor-intensive, though workers now had sophisticated tools at their disposal. For example—again quoting MacLachlan—“the sawing of the brisket bone (formerly done on the floor with a hand saw or cleaver) was accomplished by a worker on a low platform using a reciprocating saw with guard to avoid piercing the paunch.” Evisceration then required only a few knife strokes; the viscera “slumped out of the body cavity in one large intact mass,” after which government inspectors

⁴ *Ibid.*

examined them for signs of disease. Another worker used a band saw to split the carcass in half down the center of the spinal column. A final trimming to remove contaminated material and imperfections in appearance was followed by a hosing-down to remove blood and bone dust. Finally, the two sides of the carcass were pushed into the cooler for a twelve- to fifteen-hour period of chilling from about 100 degrees Fahrenheit to 34 degrees.¹

The Can-Pak system so cheapened labor and improved productivity that it quickly spread to the United States. By 1954, for example, Hormel was using it in new plants. From the perspective of management, its advantages included its elimination of some of the highest-paid positions in the industry, such as skilled floorsmen and “cleaver-wielding splitters.” In 1964 a trade association estimated that the Can-Pak system reduced labor costs by almost \$2 per head. The old technology requiring interruptions of the continuous overhead chain was out of fashion in large beef plants by 1960.²

Even apart from the invention of continuous on-the-rail dressing, the postwar period was tumultuous for U.S. meatpacking, as many studies have documented. The modern highway system and the corresponding rise of the interstate trucking industry made practical the emergence in rural areas of large commercial feedlots holding tens of thousands of cattle in pens, where they were fed on special diets to fatten them up before slaughter. New packing firms in the 1950s and '60s took advantage of these developments to establish a presence in the industry, and eventually to destroy the monopoly power of the older Big Four meatpackers (Armour, Wilson, Cudahy, and Swift) and establish a new “Beef Trust.” Their strategy was to build single-story plants near feedlots, a location that made possible direct buying from livestock producers (i.e., the elimination of middlemen), more efficient shipping of cattle to the plant for slaughter, and a cheaper workforce, since these rural regions in the Corn Belt, Great Plains, and South tended to have a weak union presence and therefore lower wage standards. Lower wages meant that meat could be sold for less, which meant that the big packers based in such cities as Chicago and Omaha, whose workforces had been unionized since the late 1930s, lost profits and market share to the cheaper, smaller upstarts. But the latter’s success wouldn’t have been possible had it not been for the invention of mechanically refrigerated trailers, which allowed the new packers to bypass the Big Four’s railroad-based distribution system. All these factors combined to cause the decline of the Big Four, which entailed the decline of Chicago and other cities as meatpacking centers. Since they were the hubs of unionism, union power in the industry was in terminal decline by the 1980s.³

In this transformation of the industry, a company called Iowa Beef Packers, later IBP, played an important role. Founded in 1960, IBP’s main contribution was its invention of “boxed beef” in the late 1960s. Prior to that, the firm had been instrumental in establishing viciously anti-union and low-wage policies among the new generation of “rural” meatpackers. It had also introduced technical innovations, such as refrigerating the entire slaughter and packaging process after the kill in order to reduce shrinkage from dehydration, as well as speeding up the whole process to such an extent that one worker complained he did not “have time to sweep sweat from [his] face.” Boxed beef, however, was revolutionary. Hitherto, quarters of carcasses had been sent hanging in truck or rail cars to wholesalers and retailers; skilled butchers would then debone them and cut them up into smaller portions for consumers. What IBP did was to include deboning and cutting operations in its own plants, allowing it to pack meat in cardboard boxes and thus use trailer-space more efficiently, cutting costs. (Instead of irregularly shaped carcasses awkwardly hanging, there were now boxes stacked tightly from wall to wall and floor to ceiling.) Boxed beef also benefited retailers, in that it eliminated their need for skilled meat cutters and thereby reduced labor costs. The cutting that went on in IBP’s plants was only “semiskilled”: workers stood next to a conveyor belt, each making

one or two swift cuts as animal parts passed by. Another advantage of boxed beef was that the vacuum-sealed bags in which meat was packed before being put into boxes extended the product's shelf life by nearly a month. For all these reasons, IBP's innovation conquered the industry in the next two decades, leaving failed businesses and a new "Big Three" in its wake. (The Big Three that emerged included IBP, ConAgra, and Excel, a subsidiary of Cargill.)¹

The whole history that has just been summed up illustrates the central theme of this paper, that even in an industry as hard to mechanize as beef-packing, the deskilling of work in one form or another has been going on since the mid-nineteenth century. Under the simple imperative of cutting cost-per-unit so as to increase profit and lower prices, business has utterly transformed the nature of meatpacking. The work that people do and the ways consumers get their meat—and the kind of meat they get—have been determined largely by the evolution of productive forces, as Karl Marx would say, under the impetus of the dynamic of prevailing production relations. Workers have had to adapt as best they could to changes that have been foisted on them, to new technologies, new work-paces, and new intensifications of the division of labor. In the era of unionism, from the late 1930s to the 1980s, they had an unusual amount of power, but even then their interests were definitely subordinated to those of their employers.

Ironically, technological change and "deskilling" do not have to be to the detriment of workers. As we'll see below, the former can entail greater safety, greater comfort, and sometimes a more human environment; the latter can entail the elimination of onerous aspects of work. In the framework of capitalism, however, advances in technology and the division of labor sometimes have negative implications for workers.

Overview of beef-packing since the 1960s

Remarkable changes have taken place in meatpacking in the last sixty years. First of all, the industry has evolved from the relatively concentrated one of the Big Four to the decentralized one of the 1960s and 1970s, followed by the return to concentration in the 1980s and afterwards. In 1950 the four largest packers slaughtered 36.4 percent of commercially slaughtered cattle in the U.S. (down from 43.1 percent in 1940); in 1970 the figure was 21.3 percent. After the mid-1970s it rose again: 28 percent in 1980, 54 percent in 1987, 70 percent in 1997, and higher since then. Concentration in hog slaughter has been less extreme, the four largest firms accounting for 54 percent of it in 1997. Plant sizes, too, have increased in recent decades. In 1977, beef plants that slaughtered more than 500,000 cattle a year were responsible for 12 percent of industry production; in 1997 they were responsible for 65 percent. Correspondingly, the number of meatpacking plants has decreased: in 1977, for example, there were 2590, while in 1992 there were 1405. (For plants specializing in meat processing the respective figures were 1345 and 1260.) These bare figures suffice to show that concentration and consolidation have been on the rise since the late 1970s.²

What explains this fact? In a word, technology. More precisely (to quote a government study), "economies of scale in hog and cattle slaughter emerged in the 1980s and 1990s. The largest slaughter plants in 1992 held significant cost advantages over smaller plants." Especially in cattle slaughter, consolidation among large plants led to greater concentration (near-oligopoly) in the industry. An important reason that scale economies did not emerge in meatpacking until the 1980s is that large plants in the 1970s and earlier paid higher wages than smaller plants, sometimes 10 or 12 percent higher. Only in the 1980s

² OECD Secretariat, "The Beef Chain in the United States of America," in *Towards a More Efficient Beef Chain: Documentation Assembled for the Symposium Organized by the OECD in Paris from 10th-13th January, 1977* (Paris: OECD, 1977), 142; James M. MacDonald et al., *Consolidation in U.S. Meatpacking*, USDA Agricultural Economic Report No. 785 (Washington, D.C.: USDA/Economic Research Service, 2000), 8, 9; Food & Water Watch, "Horizontal Consolidation and Buyer Power in the Beef Industry," July, 2010, at <http://documents.foodandwaterwatch.org/BeefConcentration.pdf> (accessed November, 2011); Michael Ollinger et al., *Structural Change in the Meat, Poultry, Dairy, and Grain Processing Industries*, USDA Economic Research Report No. 3 (Washington, D.C.: USDA/Economic Research Service, 2005), 11.

did large unionized firms succeed in reducing wages to the levels paid by non-unionized firms. In that decade, too, union membership in the meat-products industry (including poultry slaughter and processing) declined from about half to a fifth of all workers, and white employees—seeking better jobs—began to be replaced by Hispanics. The general theme of the period beginning in the 1980s, therefore, has been that of manufacturing as a whole: a consolidation of power among employers vis-à-vis employees and unions, and a consolidation of power among big businesses vis-à-vis smaller competitors. Through mergers this power has increased even further: Conagra, for example, purchased Swift in 1990, and Tyson purchased IBP in 2001.¹

In this context of business concentration and union disintegration, it is no surprise that line speeds and output in meatpacking (and poultry) plants have dramatically increased in the last thirty years. “The old meatpacking plants in Chicago,” Eric Schlosser observed in 2001, “slaughtered about 50 cattle an hour. Twenty years ago new plants in the High Plains slaughtered about 150 cattle an hour. Today some plants slaughter up to 400 cattle an hour—about half a dozen animals every minute....” At the same time, beef consumption in the U.S. has declined. As chicken consumption increased from 20.8 pounds per capita in 1950 to 83.9 pounds in 2008, beef consumption declined to 64.1 pounds in 2008 from a peak of 88.2 in 1975. Foreign demand has helped ensure that U.S. beef production continues to be a healthy industry.²

Technological change on the beef kill floor since the 1960s

In the years and decades after World War II, the age of automation began in many industries. In the meat-products industry, poultry slaughter and processing became more automated than that of hogs, which was more automated than that of cattle. A 1966 study listed some of the recent technical innovations: “rail dressing of cattle; moving-top inspection tables; antioxidants for lard; a continuous list of improvements in packaging materials and equipment; many new products such as skinless, boneless hams; electronic smoking; needle pumping of bellies [to inject brine, water that contains salt, curing substances, and additives]; electronic data processing; mechanical boning knives; low-temperature, centrifugal separation of fats; continuous frankfurter machines; and new beef-tenderizing methods.” One can follow the introductions of these and other inventions by perusing the pages of the monthly (originally weekly) industry journal *The National Provisioner*, especially the frequent advertisements for every kind of meatpacking-related machine conceivable.³

Let’s look at a few of these advertisements, specifically those pertaining to the beef kill floor. The common threads running through them are *speed* and *reduction of labor*, though improvements in cleanliness and safety are often emphasized as well. In 1962, for example, we encounter the “Seitz Eviscerating Drop,” which “drops beef from high rail to low position and simultaneously spreads hind quarters. Enables fast, convenient eviscerating....” There is also the “Pneudraulic Head Splitter,” described as follows: “This compact and rigidly built machine efficiently splits heads, leaving brains intact. Low installation, operating and maintenance costs make it a real profit maker on any Kill floor.... Each stroke is controlled by twin operating handles which require the placing of both hands well out of danger.”⁴ In 1964 we see an advertisement for a stun gun (made by Koch Supplies) that doesn’t injure the animal’s skull or brain:

This Cash knocker is *bulletless!*

¹ MacDonald et al., *Consolidation in U.S. Meatpacking*, 6, 9; James MacDonald and Michael Ollinger, “Consolidation in Meatpacking: Causes & Concerns,” *Agricultural Outlook*, June-July, 2000: 24, 25.

⁴ *National Provisioner*, April 14, 1962, 53; April 7, 1962, inside back cover.

There is no shooting gallery in this plant! It is not possible for a stray bullet to drop a human target here, because *no bullets* are used.

Special .25 caliber blank cartridges, made without wadding of any kind, activate a devastating, short piston-stroke that drops largest bulls. (Discharge seldom startles because a ventless chamber muffles most of the sound.) A long handle makes it easy to reach animals that duck into far corners.

Bulletless Koch stunning makes it more practical to save brains (there are no bullets or fragments to pick) and brains may add thousands of extra income dollars every year.

Safe—easy—no installation—saves brains! Practical for any size plant....¹

One of the disassembly-related machines advertised in 1965 is the “‘Boss’ Hide Remover,” which “handles up to sixty (60) cattle per hour when carcass properly prepared. It is complete, easy to install, and the ‘heart’ of more profitable Rail Cattle Dressing. Approved by the U.S. Dept. of Agriculture. Has a free turning roller that is hydraulically operated. Simple to operate. Increases production. Reduces cost. Almost no maintenance required. More sanitary....” Incidentally, one can see how much more automated is meat processing than the initial phase of cattle disassembly by considering an ad for “*Butcher Boy* Automatic Feed Grinders & Hydraulic Lift Mixers”: “ONE MAN HANDLES THIS ENTIRE GRINDING OPERATION”; below that we’re told to “*Speed up production!* To 6 tons per hour or more per machine.” Even more impressive is the “Frank-O-Matic,” which “PRODUCES 9600 FRANKS PER HOUR—COMPLETELY AUTOMATICALLY.” The order of the day for the last sixty years or so has been automation, wherever, whenever, and however possible.²

An article in 1968 reports that a beef plant in Texas has achieved a production rate of 150 head per hour and is striving for 250 per hour, with the help of such innovations as clocks that record downtime on the lines in the dressing department—somewhat in the manner of F. W. Taylor, with his time-and-motion studies. In the late 1960s we also see illustrative advertisements for meat-processing machines, such as one that can produce 250,000 pounds of ground meat per week with only one man overseeing it. An ad titled “The automated hamburger” tells us, with some exaggeration, that “You put the meat in one end. Throw the switch. Then sit back and watch as the hamburger patties, sausage patties, chopped steak and other portioned products roll out the other end.” The “Bettcher Power Cleaver,” which has a capacity of 12,000 cuts per hour, “automatically cuts frozen steaks, chops....and other formed meat”—“no skill required. Operator training can be accomplished in a matter of minutes.” On the beef kill floor, an on-the-rail breastbone opener—a small power saw—“reduces miscuts and eliminates [the] need for skilled labor. Handles up to 200 beef per hour....”³

The monthly magazine *Meat Industry* (later *Meat & Poultry*) is informative as well. An article in August, 1977, for example, gives advice to management on when and how to introduce greater mechanization into plants. In a session at a Food Marketing Institute convention, grocery-chain managers who had mechanized warehousing suggested that in order for employees to cooperate with labor-saving technological changes it was necessary only to treat them with respect and let them know what exactly was changing. (A reasonable suggestion.) Let the workers and their union know that they would not lose their jobs—or perhaps only a few would—but instead would be retrained. Most labor-savings would come later, when production volume increased but more workers did not have to be hired. Mechanization could have

¹ *Ibid.*, April 11, 1964, 39. “Non-penetrating” stun guns like this were invented earlier than 1964.

² *National Provisioner*, January 9, 1965, 23; April 3, 1965, 80; February 6, 1965, 38.

³ “Beef Packer Eyes High Chain Rates,” *National Provisioner*, July 27, 1968, 10 ff.; *ibid.*, September 7, 1968, 47; October 5, 1968; February 15, 1969, 45; May 10, 1969, 2.

downsides too, however, such as a loss in product quality or in labor flexibility: “an automated or mechanized system tends to need the same amount of operators no matter what the volume is.”¹

One example of successful automation occurred in the electrical stimulation of carcasses, showcased in *Meat Industry* as long ago as 1979. Stimulating carcasses electrically as they hang from the overhead rail has many benefits, including improving the tenderness, palatability, and color of the meat. Before the automatic system was invented, workers on the kill floor had to insert a metal probe into each carcass and turn on the electrical control, and then sterilize the probe before inserting it into the next carcass. It was an inefficient and relatively unsafe system. Automation in 1979, at Sam Kane Beef Processors (in Texas), allowed producers to go from tenderizing about 25 carcasses per hour to 107. The way the system worked was that the rail passed through a large “cabinet” containing electrical equipment; as carcasses moved on the rail through the cabinet, they slid along bars through which electric current flowed. “These bars impart[ed] a pre-set number of electrical jolts, and their action [was] set off automatically by a switch which [was] tripped by the movement of carcasses on the rail.” Since then, the system has been improved.²

Perusing the meat industry’s articles and the bewildering array of advertisements for “all-new” technologies, one can be coaxed into the illusion that things have mostly gotten better, and easier, for workers in the last sixty years. Consider ads in the 1970s for a new “band-splitter,” a saw to cut carcasses in half: “Faster.... Quieter.... Smoother with less down time.... Splits entire [beef] carcass in 12 to 14 seconds; reduces bone dust approximately 66%; vibration-free.... Less operator fatigue....” Or a new air-pressure captive-bolt stunner that was smaller, lighter (weighing nine pounds), and easier to handle than older stunners. Or the “Whizard glove,” a safety glove ostensibly more comfortable, safe, and cheap than older “metal mesh” gloves.³ (“Insulative properties provide warmth for working in cold areas. Helps keep fingers more limber. Reduces common occupational health ailments caused by cold metal and chafe. 85% lighter than metal mesh glove....”) Or, after the onset of the “ergonomics” age from the 1980s to the present, the “carpal tunnel splint,” an uncomfortable-looking thing that “restrains excessive wrist movement while permitting optimal hand function.” Or the “ergonomic boot,” which includes a “self-cleaning sole,” a “pre-formed insole that is removable for hygienic cleaning,” and an “ultragrip sole design that provides maximum slip resistance.” Or the “safe rail system,” an overhead rail that prevents hooks and rollers from falling onto workers below. And so on. A seemingly endless list of inventions nearly all of which are designed to make things cheaper and faster for employers and easier and safer for employees. It is ironic, then, that, for workers, the industry has effectively returned to “the jungle” of the early twentieth century, in terms of safety, stress, and general disempowerment.⁴

What should be clear, in any case, is that most of this constantly-introduced new technology has not *in itself* made conditions worse for workers, even if its general tendency has been towards the deskilling of labor. The “hardhats, safety glasses, earplugs, steel-toed and rubber-soled boots, and...amazing array of additional gear intended to protect them from injury” that employees were required to wear by the 1980s were certainly to their benefit. Likewise, Temple Grandin’s invention in the mid-1980s of a new conveyor to carry animals from the entrance chute into the stunning area made the stunner’s job easier and reduced stress for animals. In 1972 the “V-restrainer” system had been invented for restraining cattle during stunning and shackling. It was a decided improvement, according to safety and humane considerations, over the old-style knocking box, but it had flaws: stunners had to reach excessively and uncomfortably in order to place the gun on the animal’s forehead, and sometimes cattle simply refused to enter. So Grandin invented a double-rail restrainer system that is still used today, whereby the animal walks down a ramp that maneuvers it into a comfortable straddling position atop a double rail conveyor, which carries it to the

³ The name “Whizard” first referred to an air-powered circular knife invented by Lou Bettcher in the 1950s, which made meat trimming much easier and is still in widespread use today. See Bettcher Industries, Inc., “History & Mission,” <http://www.bettcher.com/about-us> (accessed November, 2011).

⁴ *Meat Industry*, August, 1977; January, 1978, 27; September, 1977, 33; *Meat & Poultry*, August, 1989, 136; August, 1990, 48.

stunning pen. The stunner does not have to lean far over, so his job is easier, and the shackler, standing below the elevated conveyor, can easily attach the shackle to the animal's hind leg.¹

Proceeding to the 1990s, the heart of both the ergonomics and the automation era, new technologies entered the market at seemingly an even greater rate than before. As always, most of them pertained to the more-easily-mechanized processing and packaging, not the slaughtering, end of the production line. For example, fully automated vacuum-packaging machines were advertised, as were machines that processed sausage links at a rate of up to 122 a minute. In 1997 we see an ad for an “ergonomic worktable” for packing and unpacking cartons, and another for knife handles that are “ergonomically designed to fit the natural contour of the hand, providing a relaxed, comfortable grip”—and improving safety, for they are “heavily textured and slip-resistant.” Regarding slaughtering technology, there are constant improvements to all the basic tools from decades ago, including hide pullers, head splitters, brisket saws, pneumatic stunners, hoof shears, bung droppers, dehorners, bleeding rail switches, moving platforms, steam vacuums that remove pathogens and spinal cords, and so forth.²

In the heady days of the “New Economy,” with computers and high-tech equipment seemingly unstoppable in their conquest of the world, some meat-industry observers got a little carried away in their prognostications. “By the year 2035,” one declared in 1995, “human line labor [in the meat and poultry industries] will have followed bank tellers into antiquity....” Another observer stated, “I think the human role in the manufacturing facilities of the future will be to supervise the machines.” He continued, “In 40 years I think the industry will make the transition from fixed to intelligent forms of automation. With intelligent automation we’re talking about systems that will sense what is coming in and use that information to make a decision and perform a particular function. Near-term examples already emerging on the market are the automatic portioning devices that use a vision system to scan the product and then use that information, as well as other pieces of information relative to product mixture, to cut it into nuggets or shape it into a perfect breast.” Given Mother Nature’s stubborn refusal to create her cattle and hogs in uniform shapes and sizes, it is hard to imagine that kill floors will ever be completely automated. And workers in 2011 would probably dispute that their obsolescence is on the horizon. Nevertheless, the presence of such attitudes among management since the 1990s shows how far mechanization has progressed in the last sixty years.³

It is true that robots have recently been introduced into the apparently uncongenial world of meatpacking. In 2008, a robot was invented that is capable of “picking, packing and palletizing” in food washdown environments. Six years earlier it was reported that a robotic unit had been invented at an IBP facility that could “lift-pivot-and-place 1-pound rolls of case-ready ground beef, nine at a time, into cradling sheets of plastic it lays into the box in alternating layers with the beef. The result is 36-unit boxes of beef ready to ship.” Among other inventions credited to this IBP facility is the Intellijantor, which lifts and cleans heavy conveyor belts every day, thereby saving morning cleaning crews from the “awkward, backbreaking task they used to do, manually lifting and holding the 3-foot-wide belts while they were washed with hoses.” Another machine, perhaps the most impressive, can adapt to individual cuts of meat: it “identifies the small dimple at the end of the bone in a T-bone steak, then triggers a cutting blade to trim the meat at just the right spot” in order to make uniform steaks. So far, however, the robotic units used in the industry seem to be, if not exceptions, at least rather lonely pioneers. In any event, slaughtering cattle

² *National Provisioner*, October, 1995; July, 1996; October, 1997; May, 1997; June, 1998; August, 1997.

³ Keith Nunes, “Technology: ‘We Haven’t Seen Anything Yet,’” *Meat & Poultry*, January, 1995, 22; cf. Roger Horowitz, *Putting Meat on the American Table*.

is a less pleasant thing than packing and palletizing, or pivoting and placing, and robots would doubtless not find it to their liking.¹

Since at least the 1990s, as consumers have become more alert to the dangers of tainted meat, a good deal of engineering ingenuity has been devoted to the problem of how to clean up the filth endemic in slaughterhouses and so reduce the incidence of food-borne illness among the population. In 1995, for instance, Cargill and a Swedish firm called Frigoscandia announced that they had developed a method to nearly eliminate bacteria in beef, pork, and poultry. The process used a blanket of steam to pasteurize the surface of carcasses. Because of its health benefits and the fact that it used less energy and water than the hot-water bath technology that was then used to clean carcasses before they were cooled, Excel, IBP, and other beef processors quickly integrated it into their slaughtering lines. The method has by no means eliminated bacteria or the need for periodic recalls of meat, but it is an improvement.²

Skimming issues of the *National Provisioner* and *Meat & Poultry* since the 1990s, one has the impression that, while automation in pork and poultry continues to advance steadily, technological change has slowed a bit in beef-packing, especially on the kill floor. There are fewer articles and advertisements that address it, *much* fewer than in the 1960s and '70s. This is probably because beef consumption has been experiencing a decades-long decline, as mentioned above. Instead what we encounter are more advertisements pertaining to poultry and pork, and sometimes beef processing. A recent ad shows how sophisticated machines have become:

New system stuffs 400 links per minute

Handtmann has launched its new 400 links/minute Natural Casing Automation system with robotic orientation and loading. The system features high-speed, high-resolution photo scanning whose data drives the seamless integration of automated robotic orientation and loading functions with Handtmann's precise VF stuffer and high speed PVLS 125 revolving head/paired nozzle linker. The stuffing/linking system operates with patented digital servo-electronic controls.... [etc].³

Four hundred links per minute is pretty miraculous. Such machines demonstrate that human labor in meatpacking continues to be superseded—day by day, month by month, with each new invention launched on the market.

What has all this technological progress from the 1960s to the present amounted to? From one perspective, the answer might be “Not much.” A 1982 government report was prescient:

Technological change will probably be limited in the meat products industry in the 1980's, with the possible exception of more sophisticated equipment for processing retail cuts of beef. Improvements to existing machinery are being made, but design concepts or functions are not expected to change. In meatpacking and poultry processing plants, new technologies were introduced in the 1960's that mechanized processing to some extent and reduced unit labor requirements. However, most cutting tasks must still be performed manually, and the industry remains relatively labor intensive.⁴

Mutatis mutandis, every sentence in that paragraph—at least as applied to meatpacking (not poultry), especially beef-packing—is still more or less true today. With regard to the beef kill floor, there have been no major changes in the basic concept of continuous on-the-rail bleeding and dressing of carcasses, only incremental improvements in its implementation. The Can-Pak system has been a serviceable one for management, since, as stated above, it takes most of the control over the pace of work away from employees. To a great extent, the obstacle to faster speeds is no longer employees' wills but simply nature, i.e. the limits of human endurance and the heterogeneous character of bovine bodies.

In another sense, however, technological change has had fairly impressive results. Combined with employers' speeds-ups and layoffs, which it has helped make possible, it has increased productivity substantially in certain periods over the last half-century. Between 1967 and 1972, output per hour in the red meats industry advanced at an annual rate of 2.2 percent; between 1975 and 1980, it rose at an annual rate of 4.2 percent, as output itself rose 3.4 percent and hours declined 0.7 percent. The corresponding annual figures for productivity gains were 2.9 percent (1967-72) and 3.7 percent (1975-80). These were higher than the gains in manufacturing as a whole. Similarly, from 1977 to 1986 productivity increased a bit more in meatpacking than in all manufacturing, at average annual rates of 3.4 and 3.0 percent, respectively. (For these ten years, however, meatpacking output rose only 0.7 percent a year, most of the productivity gains being accounted for by a 2.7 percent annual decline in employee hours.) According to one study, if we measure labor productivity by the index of output per employee hour and use 1987 as the base (100), in 1970 productivity was 57.7, while in 1998 it was 103.8. Thus, over this period labor productivity increased nearly 80 percent. (This study shows, though, that the growth of productivity has slowed of late, perhaps in part as a result of increasing concentration in the industry.)¹

The consequences of technological change have been equally “impressive” with regard to employment levels and the conditions in which workers must labor. We turn now to the human side of automation.

Implications for workers

The comfortingly impersonal survey of technological advance provided above gives little hint—aside from the sanguinary names of instruments for slaughter—of the messy realities of workers' lives. One might think that all this progress would have largely positive ramifications for workers, but on the whole, the contrary has been the case. The consequences have been mostly negative—not because of the supposedly intrinsic “anti-human” nature of technology, but because of the embeddedness of technology in capitalist social relations.

First of all, automation has made it possible for more and more workers to become economically redundant, resulting in declining levels of employment—particularly in manufacturing. In other words, greater productivity has allowed employers, individually and in the aggregate, to hire fewer workers (especially relative to the growth in the country's population). Statistics tell the story. In absolute numbers, employment in U.S. manufacturing increased (with occasional drops) from 15,438,000 employees in 1960 to 19,426,000 in 1979, then declined (with occasional, temporary increases) to 17,695,000 in 1990, 16,441,000 in 2001, 13,879,000 in 2007, and 11,524,000 in 2010. In meatpacking, employment decreased from 274,000 in 1947 to 189,000 in 1972, about 120,000 in 2000, and 98,400 in 2008. These numbers are

¹ Richard B. Carnes, “Meatpacking and Prepared-Meats Industry: Above-Average Productivity Gains,” *Monthly Labor Review*, Vol. 107, No. 4 (April, 1984): 38; Martin Personick and Katherine Taylor-Shirley, “Profiles in Safety and Health: Occupational Hazards of Meatpacking,” *Monthly Labor Review*, Vol. 112, No. 1 (January, 1989): 7; *Choices: The Magazine of Food, Farm, and Resource Issues*, 4th quarter 2003, <http://www.choicesmagazine.org/2003-4/2003-4-06.htm>.

more striking when one recalls that U.S. population has more than doubled from 1950 to the present, going from 152,271,417 in 1950 to 312,000,000 in 2011.¹

Compare these numbers for manufacturing to those for the service sector, which has lower labor productivity (due in large part to the greater difficulty of mechanizing): from 26,650,000 in 1960 to 89,582,000 in 2010. In fact, the greater productivity of manufacturing has made possible since 1950 an average annual increase in output of 3.4 percent, even as the sector has declined as a share of total non-farm employment from 31 percent in 1950 to 20.7 percent in 1980, 13.1 percent in 2000, and 9.1 percent in 2009. This latter trend has been called “deindustrialization.” It is not directly caused by technological advance, but such advance has helped make it possible by permitting the gradual supersession of human labor. (The causes of deindustrialization are complex, involving heightened international competition and declines in the growth-rates of manufacturing profitability, investment, and demand. As suggested above, greater international competition and diminished growth of profitability have necessitated feverish cost-cutting, which has meant more automation, employee layoffs, wage-cuts, and offshoring of production—which in turn, by reducing purchasing power, or effective demand, in the domestic economy, have in the long run reinforced trends toward lower sales and profits, which have themselves reinforced the need to cut costs, thus creating a vicious circle of American “de-development.”)²

Workers and unions in the 1950s and '60s clearly understood the destructive potential of automation, and they warned against it. Their attitude, however, was not one of unqualified and reactionary rejection. Instead, unions such as the United Packinghouse Workers of America presented intelligent analyses and constructive proposals for remedies to problems posed by technological advance. The pages of *The Packinghouse Worker*, the newspaper of the UPWA, are replete with articles weighing the perils and potentials of automation. For example, upon the establishment in 1961 of a subdivision of the U.S. Department of Labor devoted to the problems of automation, the newspaper’s editor observed that more government action is required than “the retraining or the redirection of workers who have been displaced by automation.” He continues:

Technological advance should be a boon to humankind and not a curse. It is not enough to assume that technological advance should proceed undirected, unregulated and ruthlessly, while government limits its function to applying economic first aid to the injured workers. Government has the far broader responsibility of attempting to guide, plan and regulate the entire process in a manner which will be conducive to economic growth but which will, at the same time, avoid economic catastrophe before it occurs.³

The nature of such “economic catastrophe” is explained elsewhere in the same issue: automation could become “a suicidal device; for it makes possible increased efficiency and increased production, but it destroys the very market which that same increased efficiency and increased production make more necessary than ever before.” That is, by destroying jobs it reduces purchasing power. This is a far-sighted and probably correct analysis, at least according to Keynesians and Marxists, for whom a major problem with capitalism is its chronic insufficiency of demand.

³ *Packinghouse Worker*, June, 1961.

Ralph Helstein, president of the UPWA from 1946 to 1968, had made a similar call for government intervention a month earlier at the UPWA Food and Allied Conference. The problems of automation, he said, could not be solved within the framework of collective bargaining; instead, “tax policy is at the center of possible government techniques for making the transition from the mechanized economy we have known to the period of automated economy into which the nation is entering.” Through changes in tax policy, government could shift the onus of paying for new buildings and machinery from the individual tax payer to corporations. Helstein also proposed that Congress set up minimum wage levels for each industry so that differences in wage rates could not serve “as a basis for competitive advantage between employers.” The July, 1960 issue of *The Packinghouse Worker* summed it up: “Organized labor’s position on automation, briefly, is this: Automation can’t be stopped. But that does not make it desirable. For, on balance, automation does create large-scale unemployment. Any beneficial results from automation for all the people—and not just corporate stockholders—will have to be planned for. And, in all likelihood, fought for.”¹

Organized labor evidently understood the enormity of its problem. Indeed, by the early 1960s much of the country was apprehensive about the automated future. In 1963, a major article in *LIFE Magazine* (quoted above) captured the mood with its alarming headline: “The Point of No Return for Everybody”—subtitled “Automation: Its Impact Suddenly Shakes Up the Whole U.S.” This exciting but frightening phenomenon, we learn, “displaces men. It has thrown hundreds of thousands of people out of work and will throw out many more. It is at the base of all the big recent labor trouble: the dock strike, the New York newspaper strike, the bitter railroad dispute...”² The UPWA, a particularly militant union, issued many reports on the dire possible consequences of increased mechanization. In 1957, for example, after surveying its members at some mechanized plants, it tabulated the data on their employment:³

<u>Type of machine introduced</u>	<u>No. of workers employed</u>	
	Before	After
Conveyors, tractors, lifts, etc.	339	83
Injecto-cure	80	23
Bacon slicing operations	69	31
Other wrapping-packing operations	124	44
Hair scraping [of hogs]	95	87
All other types of machinery	149	78

The report concludes that through mechanization, plant closures, and speed-up, meatpacking lost 36,000 jobs between 1952 and 1957—even as levels of output increased.

What was to be done? Collective bargaining provided palliatives, such as lower retirement ages, larger pensions, longer vacations, and transfers to new plants when old ones shut down. But these were not long-term solutions. Sometimes they were not even short-term solutions, as the UPWA and the Amalgamated Meat Cutters and Butcher Workmen’s experience with Armour shows. In 1959, representatives from the company and the two unions formed, with great public fanfare, an Automation Committee to help retrain and transfer (to new plants) employees laid off by plant closings. A study it conducted of laid-off employees’ experiences in four cities—Columbus, Fargo, East St. Louis, and Oklahoma City—found, for instance, that a year later in East St. Louis 56 percent were still unemployed, and that 61 percent of black workers, as opposed to 36 percent of whites, could not find jobs. Similarly, 52 percent of women, compared with 39 percent of men, remained unemployed. As for the transfer program, even when it was “successful” the employees typically lost their seniority and accumulated severance pay

³ “How Mechanization and Plant Closures Are Holding Down Packinghouse Employment,” UPWA Papers, box 382, folder 5.

and pensions. But in fact, Armour systematically undermined the program, in order, as the UPWA charged, “to rid itself of the ‘nuisance’ of [current employees’] accumulated rights with respect to such matters as vacations and other benefits, and to rid itself of union contract provisions of its employees.” As a result, the UPWA withdrew from the committee in 1963, proclaiming that “Our continued silence on the failure of the Committee would only result in maintaining a facade of decency and humaneness that would conceal a ruthless program of mass termination of employees of long service and cynical manipulation of the natural fears of its employees to accomplish drastic cuts in wages and working conditions.” The union went on strike, demanding that Armour accept transferred employees at six new plants; after six weeks the company acquiesced.¹

Nevertheless, in the long run, as we know, unions lost the war. By the 1980s they were frequently compelled to engage in concession bargaining, acceding to employers’ demands that, in particular, wages be lowered or else the company would close the plant or just go bankrupt. The result was that, while meatpackers’ wages had for a long time been higher than the average manufacturing wage—15 percent higher in 1960, 19 percent higher in 1970, and 17 percent higher in 1980—the trend reversed: wages were 15 percent lower than the manufacturing average in 1985, 18 percent lower in 1990, and 24 percent lower in 2002. Between 1980 and 2007, real wages in the industry dropped by an incredible 45 percent. In May, 2010 the median hourly wage was \$11.24, with at least ten percent of workers (probably more) making about \$8.32 or less—less even in nominal terms than the base wage of \$8.66 that Armour and Swift had paid in their Texas plants in the 1970s.²

Aside from its indirect impact on wages, reduced employment, and reduced union density, the use of more efficient machinery has influenced shopfloor dynamics, for instance gender relations. From the time when they entered the meatpacking industry, in the 1890s and early 1900s, women worked in processing departments, not in the production of fresh meat. They worked in sausage, bacon, offal, casings (for sausage), pork trim, and other such low-status, low-pay departments usually located one floor below the slaughter area. Men dropped leftover meat down chutes to the women below, who did the unpleasant work of “processing” it. Due to the physical separation between the sexes and women’s unambiguously lower status, men did not show as much resistance as might have been expected to the presence of women at the workplace. Things started to change in the 1950s. First of all, the UPWA succeeded in eliminating the disparity between male and female starting pay, although jobs were still segregated and women had fewer opportunities for promotion. As technological change accelerated, though, eliminating many traditionally female jobs in processing departments, women began to protest against their exclusion from the less-easily-automated male jobs. At the same time, the new rural packers’ construction of single-story plants in the 1950s and ’60s brought women and men physically closer together, sharpening conflict (and encouraging sexual harassment). Roger Horowitz observes that the replacement of vertical chutes by horizontal conveyor belts as mechanisms of transferring meat to women’s departments eliminated an old symbol of women’s being “beneath” men. After the Civil Rights Act of 1964 gave women a means of legal redress, the old sexual division of labor finally collapsed.³

By the 1980s, women no longer had to work in their own subordinate departments. Even in the late 1960s, IBP was already recruiting them to work on its cut and boning floors, though that was only because it paid them less than men. Despite the advances women have made, however, they have yet to attain the

same status as many male employees in the industry. It is true that they moved into jobs that required the operation of machines—but, as Horowitz says, these were in processing departments that had always been open to them. It is true they could move into butchering jobs—but now, after the automation and boxed-beef revolutions, these were more unskilled than they had ever been. It seems that even today women rarely work on kill floors, except in menial positions. Ironically, their low-paying jobs in processing departments, despite being called “unskilled,” are quite difficult, due to the necessity for precision cuts at high speeds. Some typically-male kill floor jobs, on the other hand, such as “bung dropper” in hog plants (a job that consists of placing a small machine into the body to cut out the anus), are comparatively easy and yet tend to pay well. Such are the injustices of gender roles.¹

Automation has had major implications not only for gender relations but also for the ethnic composition of the industry’s workforce. In the 1970s the workforce was still overwhelmingly European-American; as IBP and other companies automated, deskilled, and forced down wages, white people left in droves and Hispanics and Asians took over. By 2005, the United Food and Commercial Workers union claimed that immigrants constituted 50 percent of the industry’s workforce; the Pew Research Center estimated in that year that about 27 percent of butchers and food processing workers were undocumented immigrants. Since the 1990s, the entrance of North Africans—Sudanese, Somalis, Muslims from various countries—has added to the ethnic mix and heightened the potential for conflict. For example, at a Swift plant in Grand Island, Nebraska that has 2500 hourly workers (66 percent of whom are Hispanic), ten languages or dialects are spoken daily. Among the inter-ethnic problems reported there is discrimination from the more established Hispanic immigrants against the newer Somali and Sudanese workers. Language problems add to the tension, although apparently most of the workers are bilingual. The main source of conflict is cultural division. For instance, in 2009, “about 500 Swift workers, all Muslim and most Somali, walked off the job and marched a mile to Grand Island City Hall to protest for religious freedom. They wanted prayer time during the holy month of Ramadan.” When the plant moved to accommodate the requests, counter-protests were staged by whites, blacks, Hispanics, and Vietnamese. The company then created a human relations committee that meets weekly and is open to attendance by all employees.²

Judging by the reports of investigative journalists and anthropologists, plants are sometimes steeped in racial prejudice. Mutual animosity, aggravated by stress, can saturate the workplace. In 2000 a *New York Times* reporter investigated conditions in a Smithfield hog plant in Tar Heel, North Carolina. What he found was that the few whites tended to be mechanics or supervisors, American Indians were supervisors or had “clean menial jobs like warehouse work,” and blacks and Mexicans had the dirty jobs—black women being assigned, for example, to the chitterlings room, “where they would scrape feces and worms from intestines,” and black men working on the butchering floor. Mexicans were given the painful, dreary jobs of cutting pieces of meat every few seconds on the conveyor belt. What united the groups were ties of contempt and resentment. The other races had contempt for the Mexicans, and the blacks resented them for allegedly driving down wages; Mexicans considered blacks lazy and disliked them; both groups hated their white supervisors. Reports from other parts of the country tell similar stories.³

The predominance of immigrants in meatpacking plants, many of whom do not speak English (although that seems to be less common now than it was in the 1990s), has had mostly negative consequences on unionization rates. In part, this is because of the high proportion of undocumented immigrants: Latinos who are worried about deportation are not eager to complain about poor working conditions. In part it is because of language difficulties. In part it is because of the hostility and misunderstanding that prevail in an environment of many different races, ethnicities, cultures, and

languages. And in part it is because of “the frequent movement of immigrant workers.” In fact, annual turnover rates in some plants are 100 percent, and in the 1980s and 1990s they occasionally went as high as 400 percent. Since the deskilling of work has made possible very quick training sessions for new employees, such high turnover rates do not overly inconvenience companies. They do, however, make it difficult to unionize—so companies have little incentive to reduce them.¹

Why such high turnover? One factor above all is responsible, for it leads to most other complaints workers have about their jobs: *the speed of production*. Here, finally, we get to the heart of what automation has meant for the average worker in his or her job duties. Many studies have documented the appalling speeds of production and their consequences on workers’ physical and emotional well-being, but they are worth considering again here. The terrible significance of *speed*, of companies’ obsessive quest for faster and faster line speeds, cannot be overemphasized. It, too, has been a result, in part, of technological progress in the profit-driven framework of capitalist production relations. The main task for any would-be reformer of conditions in the meat industry is to find some way to force companies to slow down their pace of production.

The figures on meatpacking output quoted above (from Eric Schlosser) give some sense of the degree to which management has increased line speeds since the 1960s. More evocative, however, is the surge in repetitive motion disorders, such as carpal tunnel syndrome. Meatpacking has always been a dangerous industry, but the nature of its injuries and their frequency have changed over time. In 1943 a government report found that, while meatpacking accidents causing absence from work were twice the national average for manufacturing, “wrist and hand afflictions” (in which category most repetitive motion disorders would fall) constituted only 11 percent of injuries. Nearly all the others were cuts, bruises, fractures, and strains. In the 1940s and afterwards the UPWA succeeded in dramatically improving meatpacking’s safety record, but by 1970, after years of intensive mechanization and the anti-union policies of firms like IBP, things had deteriorated again: the injury rate had climbed to three times the average for all manufacturing. This trend continued over the next twenty years. In 1985 the industry had an injury-and-illness rate of 30.4 per 100 full-time workers, whereas the rate for all manufacturing was 10.8. By 1991 the rate for meatpacking had increased 40 percent over 1981. “Much of the increase,” Roger Horowitz remarks, “can be traced to a cascade of repetitive motion disorders classified under industrial ‘illness.’ The incidence of occupational illness—primarily carpal tunnel syndrome—grew an astonishing 442 percent between 1981 and 1991. Illnesses contributed less than 10 percent to the injury rate in 1981; ten years later they were more than one-third of the total injury rate.” With some workers having to make as many as five precision cuts every 15 seconds, this appalling “illness” rate is no surprise.²

The horrors of meatpacking work are well-known, having been documented in such industry exposés as Eric Schlosser’s *Fast Food Nation* (2001), Gail Eisnitz’s *Slaughterhouse* (1997), a Human Rights Watch report entitled *Blood, Sweat, And Fear: Workers’ Rights in U.S. Meat and Poultry Plants* (2004), and numerous newspaper and magazine articles from the 1980s to the present. An article in 1989, for example, notes that “meat and poultry workers, some of whom have testified before Congress, have complained about treacherously fast production lines, where meat flies off damaged conveyor belts and blood splatters in their faces. They have described cysts, infections and crippling hand and back pains that make it hard to lift their children, comb their hair or hold a glass.” Such misery is to be expected when, according to the UFCW, meatpacking production climbed 20 percent between 1984 and 1989 even as production employees dropped by almost 10,000. Understaffing has continued in many plants, as revealed

¹ Associated Press, “Meatpacking Injuries Spawn Union Drive,” February 18, 2007; Tanya Golash-Boza and Douglas A. Parker, “Human Rights in a Globalizing World: Who Pays the Human Cost of Migration?,” *The Journal of Latino-Latin American Studies*, Vol. 2, No. 4, Fall 2007: 40; Eric Schlosser, *Fast Food Nation*, 160.

² Roger Horowitz, “‘That Was a Dirty Job!’ Technology and Workplace Hazards in Meatpacking over the Long Twentieth Century,” *Labor*, Vol. 5, No. 2, Summer 2008: 13-25; “Here’s the Beef: Underreporting of Injuries, OSHA’s Policy of Exempting Companies from Programmed Inspections Based on Injury Records, and Unsafe Conditions in the Meatpacking Industry,” Committee on Government Operations, U.S. House of Representatives, Report 100-542, 100th Congress, 2nd session (1988), 8, 22.

for instance by wildcat strikes in September, 2001 and February, 2002 at IBP and Excel plants over low pay and chronic staff shortages.¹

The ergonomics wave of the 1990s, however, reduced injury rates, showing that technology, if used properly, can be a force for good in the workplace. As Roger Horowitz notes, “1991 marks the high-water mark of injury [as opposed to illness] rates; within ten years, aggregate levels dropped by 50 percent.” Amputations and cuts were less common than they had been in the 1970s, due in part to the more extensive use of safety equipment, including not only hardhats, goggles, and earplugs, but also, as one expert states, “stainless-steel mesh gloves, plastic forearm guards, chain-mail aprons and chaps, leather weightlifting belts, even baseball catcher’s shin guards and hockey masks.” On the other hand, the incidence rate of repetitive motion disorders in 2001 was *thirty times* higher than the average for all private industry. In the same year, to quote Human Rights Watch, “the reported injury and illness rate for meatpacking was a staggering 20 per hundred full-time workers in 2001. This is two-and-a-half times greater than the average manufacturing rate of 8.1 and almost four times greater than the overall rate for private industry of 7.4.” Government-reported injury rates in meatpacking have not been reliable since 2002, when the Bureau of Labor Statistics adopted new, business-friendly ways of recording data. Even with the new recording methods, though, occupational illness rates in meatpacking are almost twenty times higher than in manufacturing as a whole.²

The degree of government underreporting of injuries is highlighted by a 2009 study conducted by Nebraska Appleseed, a nonpartisan public-interest law organization. In its survey of 455 workers in Nebraska meatpacking plants, the organization found that *62 percent* of workers had been injured in the past year. Seventy-three percent of workers stated that line speeds had increased over the year, while, according to 94 percent, the number of staff had decreased or stayed the same. About half of the respondents claimed that there were ways in which their workplace had become less safe in the previous year, the vast majority blaming line speeds.³

The speed made possible by automation and deskilling is harmful not only for the injuries it causes and its tendency to make government inspection of carcasses more difficult, but also because its increase of pressure on supervisors to make employees work harder leads to considerable verbal and emotional abuse. A common form is the denial of bathroom breaks. Examples could be multiplied without end. According to one union official, when in 1997 he met with a large group of employees who worked at an IBP plant, “[p]eople were crying, talking about being covered in diarrhea the entire shift because the supervisor wouldn’t let them go to the bathroom.” The above-cited report by Nebraska Appleseed quotes comments such as the following: “The supervisors scream at you without having any reason.” “I know of three people who urinated and pooped in their pants and afterwards they just laugh at you.” “It would be good if they trained the supervisors how to manage personnel. There is a lot of screaming and that isn’t good.” “They treat you worse than animals...” Sexual harassment of women is also common.⁴

All these phenomena, as already stated, are manifestations and consequences of “deskilling,” which is really just another word for worker disempowerment. It has been going on to some extent since the Industrial Revolution and will continue as long as industrial capitalism persists. The reason, as Harry Braverman said, is simply that it is in the interest of owners to control as much of the labor process as they can. Technological change does not have to entail deskilling, just as the latter does not have to entail the former—it can be accomplished through intensifications of the division of labor—but in the meatpacking industry since the 1950s, most advances in technology have, as we have seen, indeed had the effect of

depriving workers of ever more autonomy. From mechanical hide pullers to automatic feed grinders, power cleavers, electrical stimulators, and Intellijanitors, inventions have made possible faster speeds and reduced worker control over his or her job. At the same time, tasks have become easier (although the increase of line speeds has made them difficult again, and added new health and safety problems). Technological progress is neither “good” nor “bad”; what matter are the uses to which it is put, and the interests it serves.¹

The more I think about it, the less convinced I am that some sort of semi-fascist movement and/or regime probably won’t achieve major power in the West during the next few decades. I’m sure nothing remotely on the scale of Nazism or even Italian Fascism will happen, but something less extreme.... As economies descend into crisis and governments lose legitimacy, who knows? Business and conservatives in power may want to foment or reach out to popular anti-democratic movements. They’ve already done that with the Tea Party, but the Tea Party isn’t on a big enough scale to qualify even as semi-fascism. It’s more like the first tentative gropings towards something that might eventually approach something like a fascist movement.

One thing to keep in mind is that the fear of Communism, which helped make possible classical fascism, is gone. Any kind of revolution except the evolutionary kind probably won’t be in the cards; correspondingly, the fear of it won’t be as profound as it was eighty to ninety years ago.

*

It makes no sense to praise someone for something over which he has no control. Since people have very little control over who they are, it makes little sense to praise someone for his personality or his “noble mind” or his wit or his talent or his natural propensity to work hard or any such quality. And insofar as his acts express his propensities, it is senseless to praise or condemn him for them. In fact, similar reasoning probably leads to the conclusion that *any* act of condemnation or praise is, in a sense, misguided. (Other chains of reasoning also lead to that conclusion. For example, if the principle is that an act ought to be “praised” insofar as it is motivated by concern for others, then no act ought to be unreservedly praised, since all acts are motivated by at least as much self-regard as other-regard. Or, rather, they—at best—implicitly express both self-love and other-love. There is no “purely unselfish,” or “purely unself-ish,” act.) The paradigm for all these value-judgments, their “form” and real meaning, is revealed in something silly like the implicit approval that people project towards a good-looking person. It is a cognitively senseless² emotional reaction. Properly speaking, it has the form “I like” or “I am impressed,” not “You deserve” (even though *for the admirer*—i.e., in the phenomenology of his mental state—the form is the latter, the objective statement, not the former, the subjective statement).³ When we judge a person’s worth we’re trying to say something about *him*, but, ultimately, the more meaningful—and *sensible*—thing is what we’re saying about ourselves (such as the implicit statement “I don’t like him” or “I am in awe of him” or whatever).⁴

*

¹ [I was so sick of the paper by the end that I was incapable of writing a proper conclusion. And yes, I know the paper is inadequate. Too ambitious and unfocused.]

² [That word is ambiguous. It could mean either meaningless or not sensible. Actually, this whole discussion is a little ambiguous. I know I meant at least “not sensible,” and maybe “meaningless” too.]

³ What is senseless, or empty, is the word “deserve.” [I think the reason I chose the example of a good-looking person is that our appreciation is for something so obviously not under his control—similar in that respect to his intelligence, his talents, and ultimately most other things about him.]

⁴ Insofar as our judgment, however, incorporates a *description* as opposed to an *evaluation*, it is meaningful. For example, the statement “He’s an idiot” is meaningful insofar as it gives, or half-gives, a value-neutral description of his intelligence.

After reading a feminist blog.— Feminists often say that pornography, even the “clean” kind, is misogynistic. If you understand “misogyny” in a very broad sense, that’s true. But really it’s a silly, naïve judgment. Porn is just a reflection of male desire,¹ as a female columnist for Salon.com wrote today. There are pathological, violent and extra-degrading kinds of pornography, but those aren’t what I’m talking about. Men naturally want to, and typically *do*, dominate women in the sex act, so porn usually involves male domination of women. Misogynistic? If so, then nature is misogynistic. And so are women, because most have always wanted to be dominated during sex. (Sometimes they are unaware of that desire or convince themselves it is absent. But self-deception is a ubiquitous human capacity.)²

*

In the past I’ve suggested that the difference between mind and body can be expressed in terms of the difference between “private” and “public.” I’m still sympathetic toward that view, since it perfectly articulates the intuition behind the mind-body problem. (For example, scientists can conceivably observe the workings of my brain, the neural activity and so on, but they cannot conceivably observe my *thoughts*, at least not in the same first-personal way I do. My thoughts are private, my brain is not.) But I’ve also suggested, following Descartes, that the difference can be expressed by saying that matter is extended, i.e. space-occupying, while mind isn’t. Disregarding the paradoxes of quantum mechanics, this Cartesian view seems eminently sensible to me. Why do contemporary philosophers ignore it? It seems somewhat senseless, after all, to say that thoughts and sensations literally take up space, while it is senseless to deny that one’s body does. So, that’s the difference.

...I asked Chomsky why we can’t use the concept of extension to coherently distinguish mind from matter. He wrote back, “The problem is that Newton’s demolition of the concept ‘material’ (etc.) postulated forces of attraction and repulsion, which do not fall within the concept of matter (body, etc.), then or since. And since then even more exotic entities have been postulated.” I figured he’d say something like that. It remains the case that in our commonsense, non-Newtonian, non-quantum-mechanical world of experience, the idea of extension is one way to explain our intuition that mind and body are somehow different.

*

Returning to the thoughts on judging people’s value.... While what I said above is true, I suppose it makes sense to judge the value of someone’s whole “being,” as opposed to his *self*, according to some standards or other. For instance, I might say that Chomsky is an amazing person, amazingly talented and kind and so on, yet at the same time I might deny *him* full credit for these qualities. He happened to be born with them, or whatever. But that fact doesn’t have to prevent me from admiring and trying to emulate the “ensemble.” In other words, it’s possible to ignore the question of *responsibility* even while judging that somebody is good or bad or whatever.

Still, in most cases the attribution or denial of value to someone, e.g. for the way he habitually treats people, implicitly incorporates the idea that he is responsible for his behavior. And, after all, in a sense he is. He has a self, he is self-conscious, so he is the sovereign of himself. But, in other ways, he is *not* the “sovereign” of himself, of his talents and propensities and past experiences that have led him to feel and act in certain ways. He is free, but he is unfree. Oy vey!

*

¹ And female desire too. According to one study, a third of viewers of porn websites are women.

² Granted, *some* women are dominatrices. But in many of them that is probably explained by some unusual biological fact.

A strange thing about “freedom” is that it emerges in the animal kingdom *gradually*. Lower life-forms act in ways that are *caused* by their environments, that are *stimulated*—stimulus and response, etc. Dogs’ behavior is not just *caused* but, to an extent, is “*encouraged*” by a given situation. Dogs, that is, have *some* freedom. Monkeys and apes have more, in that automatic stimulus-and-response is less true of them. Humans are the freest of all, for our behavior is *appropriate* to situations, not *caused* by them. Not coincidentally, the gradual emergence of freedom coincides with the gradual emergence of self-consciousness, or internalization of the other and so the ability to consider oneself and one’s situation from the outside, to choose different paths, reason through consequences, etc. (The connection between self-consciousness and rationality, both manifestations of freedom.)

What’s even stranger is that some kind of mysterious alchemy goes on in the human brain to bring freedom out of causation (neural, chemical, electrical). Similarly, the brain brings the private (consciousness) out of the public. And to the extent that an animal is free, it has private experience, or consciousness. The divorce between mental and physical (or non-mental) emerges along with freedom (self-causation). You could say that consciousness, or the mental, is how an organism experiences self-causation—freedom—and is what makes possible self-causation. For, in order for there to be such causation, there surely has to be a self (i.e., consciousness) that is doing the causing. [No, I’m not sure about that. What about “structural” causation, e.g. a cell’s structure—the inter-location of different kinds of molecules, etc.—as in some sense causing what goes on in it? The cell’s structure perpetuates itself, so to speak.] Anyway, that’s the basic paradox of freedom: how is self-causation possible? What does it mean?

*

I don’t see myself pursuing a career in academia. I see myself joining the global movement against corporate capitalism. Joining activist circles, maybe after I finish my Ph.D.

*

I have to agree with Ernst Mayr (e.g. in his paper “The Objects of Selection” (1997)) that what natural selection “acts on” are not genes or species but just individual organisms, and in some cases groups. These are the only things it *could* act on; phenotypes are what directly interact with the environment, so they have to be what are directly selected or eliminated. Certain kinds of group behavior can be selected too, such as “when a pride of lionesses splits up to block the escape route of an intended victim.” That aids the survival of individuals, so it is selected. An individual’s genotype, however, or some part of it, is *indirectly* selected by virtue of the phenotype’s selection. Obviously!¹ Individual genes can’t be objects of selection, *pace* Dawkins, because “naked genes” don’t exist. Not being “independent objects,” genes are not “visible” to selection. They’re embedded, so to speak, etc.

I’m not even sure anymore that organisms are usefully considered “survival machines” for their genes, or for their genotypes, as Dawkins argues. Mayr seems to make a good case that “*replication of genes*”—or “genes as replicators”—isn’t the main point, and in any case is un-Darwinian. “What is important in selection is the abundant production of new phenotypes to permit the species to keep up with possible changes in the environment. This is made possible by meiosis and sexual reproduction. The replication of DNA has nothing to do with this.... Since the gene is not an object of selection (there are no naked genes), any emphasis on precise replication [of genes] is irrelevant....” On the other hand, maybe the word “precise” sets up a straw man. If the environment does indeed change over time, then minor changes in the genotype (to keep up with environmental changes) could be advantageous for its survival. And animals could reasonably be considered survival machines for (or “tools of”) their genotypes-plus-minor-mutations. But I don’t know. I forget most of *The Selfish Gene*.

*

¹ I suppose you could say that *species* too are indirectly selected by the success or failure of their individual members.

From the perspective of natural selection, it would be very surprising if men *weren't* more “objective” and “sober,” less “personal” and “devoted” (not to mention “subordinate,” etc.) than women. You already know about the necessity of males throughout the animal kingdom to dominate and so forth in order to spread their genes. Females choose (it's known in evolutionary biology as “female choice,” aptly enough), males are chosen. And they're chosen on the basis of whether they dominate—although of course among humans things are more complicated than just “dominance or non-dominance.” But also, the evolutionary advantages of a male's spreading his seed as widely as possible entail that most males will be interested not only in one female but in many, and so, at least among the highest mammals, will have a somewhat “detached” or “sober” attitude in relations with the opposite sex (and probably with the same sex as well, and thus with *themselves* too). They will be prone to mentally stepping back and considering things in a more distanced way, evaluating their options, looking at other females—other members of the species in general, just looking around and observing the world, looking for opportunities or interesting situations—thinking about things (and acting) more “abstractly.”¹ Females, on the other hand, are naturally selected to be *less* object-ive than males, since utter female devotion is essential to her offspring's survival and, moreover, sexually her task is not to spread her seed but to choose a male and, ideally, keep him with her. Her devotion to him is a good evolutionary strategy to keep him interested. (In humans, if it goes too far it might have the opposite effect.) When talking about a species as advanced as humans, caveats have to be inserted with regard to all these statements, but they're broadly true.

As I've said before, men's object-iveness in the sphere of interpersonal relations will tend to spread into other spheres, such as their relative enjoyment of object-ive intellectual pursuits like philosophy, mathematics, and natural science. Plenty of women enjoy these things too, but there's a more pronounced tendency for them to enjoy psychology, anthropology, art, dance, etc.

*

Continued.— When women complain about men's being “emotionally unavailable,” “closed,” “unfeeling” and all that, they're referring to something that's a product of both modern socialization and the natural facts I just mentioned.

*

Ultimately, the things people do are done essentially, on some basic level, for themselves. Necessarily. In that half-empty sense, everyone is “selfish.” The moral project is to incorporate others into oneself—as deeply as possible—and to incorporate as many others into oneself as possible, so that in acting for oneself one is also acting for others. *That* is morality, and that is how morality is possible.

*

One way of expressing the impossibility of achieving your goal as a human being is to say that you implicitly want to be surrounded by projections of your self, of your self-love—or *proofs* of it, reflections of it—but that these have to be, by necessity, “objective,” or *through the other, in the world, through other people*. So basically what you want is to enact the world's dependence on you, its love for you, its need for you, not only through *independent* things—people, objects, the world in general—but through the *independence* of things. You use their independence to try to prove their “dependence,” to make them part of you. And the more independent something or someone is—the more opposed to you, the more

¹ Cf. Jerry Seinfeld's comedic bit: he asks the audience, “Ladies, do you want to know what men really think about?” “Yeeeessss!” they all shout. “...Nothing,” he answers. “We're just walking around, observing the world, taking it all in....” Profound truth. Men tend to be less *personally interested* or *personally involved* than women and children (hence less excitable); their stance is relatively objective, or object-ive. Separation between self and other.

challenging—the more you want to make it or him a part of you, so to speak, or attain power over it/him, get recognition from it (through it), confirm your self-love through it.¹ Reduce or conquer its otherness.

I'm not expressing this very well. There are actually several reasons why the fulfillment of the human project is impossible. First, the world and things in it will always be independent of you, whatever you do. They will never be mere reflections of your self-love; you will always be frustrated to some extent in your endeavors. But second, you don't even *want* them to be mere reflections of you, even though in another sense you do. You want them to be independent because the way you confirm yourself is by "testing" yourself against their otherness. If the world were not other than you, there would be nothing on which or through which you could enact your self-love, and you'd live in a nightmare of lack-of-confirmation. As I said in the footnote, people who do not project independence from you, who do not seem confident or rather "whole in themselves" or "self-certain" (which isn't synonymous with "self-confident" but incorporates that), tend to matter less to you regarding your desire for recognition than people who do and are, because the latter are truly *other*.² You desire this otherness but at the same time want to negate it. (You desire it in order to negate it, i.e. to use it to prove your worth. By at least partially negating it (by getting it to recognize or "value" you) you enact your selfhood.) Third, the otherness is in fact *in you*, in your consciousness; you are your own other. So, without "transcending yourself"—an absurdity—you will never be able to transcend otherness. You will never be able to confirm your self-love in the *complete* way you desire. There will always be "doubt," due to the nature of consciousness.

*

As capital has become more mobile internationally [since the 1970s], undermining national boundaries and cultures, and has accumulated in ever-larger concentrations, undermining the "relative autonomy" of the state, the world has approximated ever more closely the pure model of capitalism that Marx described in *Das Kapital*. The West slowly sinks to the level of the Rest, and the Rest slowly approaches the industrialized level of the West. The latter deindustrializes and eventually sees its infrastructure deteriorate, the former industrializes and sees its infrastructure build up, though not sufficiently. Class polarization in the West approaches levels in the Rest. Conditions everywhere tend to equalize, with a hyper-elite set against an enormous reserve army of labor. A revolutionary situation ripens as the world becomes more uniform and the middle class, that historical bastion of conservatism, disintegrates.

*

2011 has been the most globally revolutionary year since 1968. The Arab Spring, the Wisconsin demonstrations, protests in Greece, Italy, Spain, and England, Occupy Wall Street (around the world), and protests in Russia against Putin. And probably a lot of other stuff I don't know about. I'm looking forward to 2012.

*

¹ This explains, for example, the frequent success, or at least the popularity, of the romantic strategy called "playing hard-to-get." If you too quickly show someone that you're a little dependent on them, that you really want them or need them, they might lose interest in you because, in a sense, they've already achieved their goal. They don't feel the need to impress you anymore; they don't "emotionally care" much what you think of them; your lack of independence has made them lose a kind of "emotional respect" for you. They want someone who is truly an *other*, independent (confident, etc.), so that they can enact their self-love and make him or her dependent....but not *too* dependent! There's a perpetual tension, you see.

² For instance, Aniela is more of an other for me, more of a *weighty self*, than Zhilan because of her relative independence, her self-confidence, maturity, and sophistication. In other words, I desire her approval more than Zhilan's.

January, 2012

What would I do without the refuge of “universality,” of music, books, art, my journal? A lot of similarly rejected people don’t have such an asylum. They can’t escape; they’re imprisoned in a world of *stupid particularity*. I’m very lucky. Nonetheless, with universality on one side and the hyper-particularity of thoughtlessness on the other, is it any wonder my emotions have atrophied?

Reading Anthony Brewer’s *Marxist Theories of Imperialism: A Critical Survey* (1980). Sometimes my living in a postmodern culture makes me forget just how obvious the economic interpretation of history is. “The motives for imperial expansion,” Brewer says, “were predominantly economic. Some historians now seek to deny this, but the men of the East India Company, the Spanish *Conquistadores*, the investors in South African mines and the slave traders knew very well what they wanted. They wanted to be rich. Colonial empires were exploited ruthlessly for economic gain as sources of cheap raw materials and cheap labour, and as monopolized markets.” Of course, “economic interests are filtered through a political process, policies are implemented by a complex state apparatus, and the whole system generates its own momentum.” So economic explanations alone do not suffice.

What Brewer says offhandedly about the two world wars is true, I think. Aside from everything I’ve said about the social causes, economic crises and so on, the wars were a consequence of the fact that “once the division of the world was complete, any further territorial expansion had to be at the expense of rival colonial empires. There was a sharp increase of tension between the main powers, especially between Germany (the rising power) and Britain (with the largest empire), which culminated in two world wars.” Britain was the declining hegemon, Germany aspired to be the next one. Hence its being the main aggressor in both wars. To a large degree they resulted from economic dynamics built up over decades (from the 1870s) relating to which European country [or, rather, which national agglomeration of “finance capital”; see below] would be economically dominant. The explosive social conflicts culminating in fascism heightened Europe’s inter-state instability and ultimately fed into the struggle between national power-structures over which nation would dominate. The “dialectics” of international competition and intra-national social conflict reinforced each other, since economic and political elites were able to channel social discontent into nationalist jingoism.

Another observation: in retrospect it isn’t surprising that in the twentieth century the world capitalist system “contracted as a result of the subtraction first of Russia, then of China, then Cuba, much of southeast Asia and so on,” nor is it surprising that later these subtracted areas would return, like repentant prodigal sons, to the fold of capitalism. The enormous social dislocation caused by capitalism led to revolutions and withdrawal from the capitalist world, hence to experiments with semi-capitalist, semi-statist modes of production, which inevitably failed in the long run because of their lack of dynamism compared to capitalism, so that in the end these countries had to reenter the world with their tails between their legs.

Thoughts on why capitalism tends to geographically expand:

The [development] of capitalism constantly expands the demand for natural resources....and this is one motive behind the geographical expansion of capitalism. Even with a static demand, development of means of transport together with the search for cheaper sources of goods will tend to draw new areas into the capitalist orbit. Capital accumulation by itself tends to increase the demand for labour power as well, but the adoption of labour-saving methods tends to offset this. The search for cheap labour is another motive for geographical expansion.

Marx’s comments on Ireland in the mid-nineteenth century pertain on a broad scale to the twentieth century too. Why couldn’t Ireland develop industry? Why was it so poor? Because of English oppression and exploitation. As Brewer says, channeling Marx, “The expulsion of the peasantry [in Ireland] and the creation of capitalist farms under the aegis (and to the benefit) of the (English) landed aristocracy followed essentially the same course as in England (primitive accumulation), though it was carried out with even

greater brutality, but: ‘every time Ireland was about to develop industrially, she was crushed and reconverted into a purely agricultural land.The people had now before them the choice between the occupation of land *at any rent*, or starvation.’” The main cause of industrial failure in Ireland “was the absence of protective tariffs; Irish industry could not survive English competition.... Just like workers from rural areas of England, the Irish were forced to migrate to seek work in the industrial cities of England.” It was basically the same thing with the global South in the twentieth century (and to an extent it still is). The absence of protective tariffs. One difference is that nowadays the West directly invests in production in the global South, thus building up some kind of industry there. But infrastructure usually doesn’t benefit much because foreign companies own the profits.

Interesting observations on England’s trade patterns in the nineteenth century: “England had a trade surplus with India (as a result of cotton exports), which India financed from its surplus with China (the opium trade), while China in turn exported tea and other products both to England and to Australia and the USA, which had surpluses in trade with England, closing the circle. Marx analyses the way in which the opium trade was a lynchpin of this pattern of trade, and therefore had to be protected and expanded (by force), while at the same time the effects of the opium trade in China actually diminished China’s capacity to import goods from the west.”

Let’s skip ahead to Hilferding. Finance capital. Not to be confused with financial capital. “Hilferding argues that the separation of industrial and financial capital, which was characteristic of the era of competitive capitalism, disappears in the epoch of monopoly capitalism. *Finance capital is the product of the fusion of industrial and financial capital.*” To quote Hilferding, “Finance capital marks the unification of capital. The previously distinct spheres of industrial capital, commercial capital and bank capital are henceforth under the control of high finance, in which the magnates of industry and the banks are closely associated.” Brewer notes that multinationals, the head offices of which “perform many of the functions of financial capital in raising money from many sources (including small shareholders, by means of share issues), and also channel flows of capital from one subsidiary enterprise to another,” can be considered a part of finance capital, whose epoch has therefore lasted over a hundred years.

Finance capital seeks the help of the state in its desire to gain the benefits of monopoly: specifically, it wants protective tariffs that shield it from international competition. The artificially high prices made possible by tariffs lead to super-profits, which can subsidize exports artificially cheap enough to undercut the prices of competitors in the importing country. (Think of WTO agreements or NAFTA provisions that allow Western corporations to be protected at home but force “free trade” on other countries, which undermines industry (and sometimes agriculture¹) in those countries.) But also, the benefits of protection cause finance capital to agitate for national territorial expansion, so that it can have access to more protected markets and more super-profits. This requires a strong, militaristic state, very different from in the era of competitive capitalism (when liberal, laissez-faire ideologies were popular).² Quoting Hilferding:

The demand for an expansionist policy overthrows the entire world view of the bourgeoisie. It ceases to be pacific and humanitarian. The old free-traders saw in free trade not only the most just economic policy, but also the basis for an era of peace. Finance capital gave up this belief long ago. It does not believe in the harmony of capitalist interests, but knows that the competitive struggle becomes more and more a political struggle. The ideal of peace fades, and the idea of humanity is replaced by the ideal of the grandeur and power of the state.... The ideal is to insure for one’s own nation the domination of the

¹ That’s what happened to Mexico after NAFTA, which allowed U.S. agribusinesses but not Mexican farmers to be subsidized. Hence the inability of Mexican agriculture to compete, an exodus from the countryside, increased crime and drug activities in cities (because of a lack of jobs), increased illegal emigration to the U.S., Clinton’s heightening of border security, etc.

² In addition to protected markets, finance capital wants “exclusive fields for capital export.” As Hobson said. Incidentally, all this stuff about monopoly capital and protected markets is “the classical Marxist theory of imperialism,” of which Hilferding was the real founder.

world.... Founded in economic needs, it finds its justification in this remarkable reversal of national consciousness.... Racial ideology is thus a rationalization, disguised as science, of the ambitions of finance capital.

Typically reductive but no less perceptive for that.

While finance capital continued to exist after World War II, it had learned that aggressive militaristic expansion—at the expense of great powers, that is—was not in its long-term interest. (The U.S. continued to be militaristic around the world, but not at the expense of major European powers—except for the Soviet Union. The latter’s existence explains the cautiousness of America’s war-making in that era.) In fact, in the U.S. its interest was in *helping* Europe, helping it rebuild, so tariffs were repealed. Once foreign competition got strong again, however, tariffs were re-instituted—though not militaristic expansion at the expense of great powers.

Moving on to Sweezy and Baran. I don’t see how Sweezy’s underconsumptionism can really be questioned. “With the development of capitalism, the share of wages, and hence of wage-earners’ consumption, in total output falls [I would say has a *tendency* to fall], while the concentration of capital into fewer hands means that a falling share of total profit is consumed. Consumption therefore absorbs a falling share of total output. (This prefigures the ‘law of rising surplus’ set out in *Monopoly Capital*.)” Stated this way, the argument seems obvious. For one thing, it is clearly true as a description of the contemporary world. Less money in the hands of the masses, hence less consumption, i.e. effective demand, hence less incentive for business to invest (because of poor prospects for profit), hence stagnation. Brewer argues against Baran/Sweezy, but he’s unconvincing. If income levels are extremely disproportionate between the elite and the masses—i.e. if there is an excessive and rising “surplus”—it’s logical to expect economic dysfunction. What you’ll get is not productive investment but elite gambling, speculation, money market bullshit, people and institutions in the elite playing the game of transferring wealth between each other in their financial bubble. Incidentally, all this is surely compatible with Brenner’s emphasis on a fall in the growth-rates of profitability (especially in manufacturing). It has to be, because both Baran/Sweezy’s and Brenner’s arguments seem basically right.

You may recall, too, that another reason for Baran and Sweezy’s indictment of monopoly capitalism—a reason derived from Hobson—is that “monopolies” tend to invest less than they might (for reasons I won’t go into), so that there is a chronic lack of demand unless other factors take over.

Summary: “Baran argues that monopoly leads to a diversion of the surplus of output over necessary consumption away from productive investment towards wasteful uses. It is thus a cause of stagnation in both advanced and underdeveloped countries.... Underdeveloped countries are dominated by foreign capital with its local hangers-on, and by mercantile and [semi-feudal] landlord interests. All are hostile to development.” All this is obviously true. Military Keynesianism, undertaken in the phase of monopoly capitalism (because it doesn’t threaten powerful interests), is more wasteful than productive investment in infrastructure. In the 1950s and 1960s, largely external factors counteracted tendencies towards stagnation, factors such as Europe’s and Japan’s reconstruction, the high level of demand in the U.S. that was a legacy of World War II, the extension of New Deal programs, and the stimulus of the *automobile* to infrastructural development. As these factors wore off, stagnation began to set in. At the same time, the situation was made much worse by the intensification of foreign competition. (Brenner.) As I see it, this—ironically—sharpened certain tendencies of monopoly capitalism. Income polarization increased as businesses cut costs, which reduced aggregate demand, which reinforced monopoly capital’s tendency towards meager investment (in the absence of offsetting external factors), etc. Wasteful uses of the constantly increasing surplus (increasing in part due to cost-cutting) became more common as capital finally got its way in dismantling New Deal regulations and programs; financial speculation and Reagan’s military Keynesianism are examples.

....It’s surprising that few of the “dependency theorists” and their kin seem to argue that the stifling of labor movements in the global South—made possible by support from the North for reactionary governments and corporations—has been one cause of underdevelopment. After all, low demand is one of the reasons for limited industrial development in these countries (i.e., there are limited incentives to invest),

and effective labor movements would raise demand, as they did in the West. Instead, income polarization is so extreme that tens of millions of people live in gigantic shantytowns while a tiny minority are multimillionaires.

It's true that higher wage-levels might eventually cause foreign companies to invest elsewhere, but insofar as demand increased, wouldn't domestic business step up investment [in *non-export* activities]? Without protective tariffs, of course, it wouldn't get very far. So what's really necessary, to repeat, is that the state and its economy not be subordinated to the interests of foreign capital.

As for labor unions, their effectiveness is surely vitiated by massive overpopulation. That must be another reason (though I don't know how important) for the South's underdevelopment. (Conversely, underdevelopment worsens overpopulation.)

Anyway, the South's subordination to foreign capital causes the survival, for a long time, of pre-capitalist modes of production, in part because (1) wages are so low that laborers have to supplement their income with peasant-work on the land (as in parts of Africa for a long time) and (2) cheap foreign goods prevent the development of domestic industry, ensuring a lack of economic opportunities in cities and thus the persistence for many decades of a huge agricultural sector. Much of this sector becomes capitalist, though, using hired labor.

Arghiri Emmanuel's theory: "unequal exchange." Inequalities between countries can arise not only as a result of monopolies etc. but also through free trade, as a result of inequities in the terms of trade. "Emmanuel's arguments mainly come down to asserting that high wages are the key to development." That's reductive, but it surely contains a lot of truth. Relatively high wages, as in England and the U.S. during their industrialization, entail both high demand and incentives to mechanize, i.e. to improve productivity, thus making possible higher wages in the future. It's a virtuous circle. In Latin America, Africa, Asia, and much of Europe for a long time, wages were a lot lower. (See Robert Allen.) It seems to me, though, that the "virtuous circle" of high wages is bound to end sooner or later: as mechanization gets sophisticated enough to become automation, more and more workers are thrown out of work, and the army of the unemployed or underemployed grows. This makes it harder for unions to maintain high wages, so wages start to fall. Etc. Tendencies towards stagnation are worsened if the economic context is one of increased foreign competition and thus pressures to cut costs. And since the cost-cutting reduces aggregate demand, firms are forced to rely, in large part, on more cost-cutting (instead of increased sales) in order to boost profits, aggravating the underlying problem. That's where we are now, for example with 2010's "greatest recovery of corporate profits on record," due to the corporate sector's capture of all the spoils of recent productivity advances (or cuts in costs). Without a labor movement, productivity improvements can actually be *counterproductive* regarding long-term growth and development, that is if they're due largely to massive layoffs or wage-cuts. That's how I see it anyway.

In any event, as Brewer presents it, Emmanuel's theory is quite complicated, so I won't discuss it. Same with Samir Amin's (which is partly just a synthesis of other theories).

If you set aside all the complicated academic debates and just think through things, they're often not terribly confusing. Consider the patterns of economic specialization between countries in the last two centuries. In the global South there has been a lot of specialization in agriculture and mineral extraction, while in the North there has been more emphasis on industry. Why? One reason is simply that the North became capitalist first and then industrialized first, and from there continued to invest in productivity improvements, thus getting farther and farther ahead of the South in industry. At the same time it forced "free trade" on the South, i.e. prevented it from instituting protective tariffs, thereby preventing infant industries from growing. The South was forced to specialize in agriculture and raw material exports. (Its agriculture wasn't very productive, due to technical backwardness and the persistence of pre-capitalist structures.)¹ Internationally capital wasn't very mobile in the nineteenth century, and productivity was high in the North, so the North's capital didn't migrate to the South and set up industrial production there. It had

¹ Apparently this ended with the Green Revolution of the 1960s and '70s, which caused the eviction of much of the peasantry from the countryside and the growth of enormous, sprawling slums all over the world.

few incentives to do that, and it was beyond its capabilities anyway. By the 1970s, though, capital was mobile internationally, and the rise of foreign competition gave it incentives to expand production in the South and reduce it in the North. (Labor's relative *lack* of international mobility—quite different from the situation in the nineteenth century—ensured that wage-levels differed widely between countries, making the South an attractive place to invest.) The North began to deindustrialize, and the South industrialized more. [Well, that statement is simplistic. Not entirely true.] Much of this industrialization was still confined to export activities because of the continued absence of protective tariffs,¹ but as the South has slowly become more politically independent of the North, the situation has begun to change. Not very fast, though. It doesn't help that foreign companies appropriate most of the profits from their activities in the South.

In recent decades the IMF's structural adjustment programs have been added to the West's bag of tricks for stealing surplus from the South. But instead of contributing to the West's further development, since the onset of neoliberalism the siphoning of the South's surplus into Western hands has accelerated the West's *de*-development, because that has been in the interests of the enriched institutions. Thus, less spending on infrastructure, less redistribution of wealth to people who would actually spend it, more attacks on labor unions, more deregulation of the economy, more worthless financial speculation, etc.

Reading David Harvey's *The Enigma of Capital* (2011). Harvey, being a Marxist, has the unusual merit of exhibiting common sense.

He has some things in common with Brenner. (And with Baran and Sweezy.) For instance, he makes it clear that in one sense financial institutions are right to say they're the linchpin of the economy: because incomes are so polarized between the elite and the masses, without absurdly high levels of lending to consumers the economy would grind to a halt. Even those with very low incomes eventually have to receive mountains of credit (as they did by the late 1990s), because confining it to the steadily employed population doesn't provide enough boost to demand. Hence the subprime loans for mortgages—in part the product of political pressure on financial institutions to loosen credit strings for everyone. (Not only the home buyers but even the property developers were debt-financed! In other words, "the financial institutions collectively controlled both the supply of, and demand for, housing!") Such loans were risky, but innovations in "securitization" supposedly spread the risk around "and even created the illusion that risk had disappeared."

So that was one way of solving the demand problem. Another way was "the export of capital and the cultivation of new markets around the world." We're back to the old imperialism, you see (dressed in modern clothes), and the old ideas of Hobson and the classical Marxists. Actually, even as early as England's forcing India to buy its cotton, "the cultivation of new markets around the world" to boost demand was going on. By the 1970s, one form of capital export—a response to the lack of profitable investment opportunities in the U.S.—was to lend massively to developing countries like Mexico and Brazil. (If they defaulted, structural adjustment programs could come to the rescue of investors.) In order for capital export to become a really big industry, though, "a globally interlinked system of financial markets needed to be constructed." No more confining banks to their home country; no more "excessive" regulations; no more separating deposit from investment banking. (Repeal Glass-Steagall!) Liquid money capital had to roam the world freely, looking for locations with high rates of return. So much surplus capital to be absorbed!

Another way to absorb capital was to privatize state-run enterprises. Hence the global wave of privatization since the 1980s.

Considering all the things that can go wrong with capitalism, it's impressive the system works at all. For example, if organized labor becomes too powerful and wages are too high, the profit-squeeze might cause capitalists to reduce investment. (Alternatively, they might invest more in labor-saving technologies.) Lay off workers, etc. If this happens on a sufficiently broad scale, stagnation could set in. (But the resulting drop in wages and loosening of the labor market might lead to increased investment, ending the stagnation.) On the other hand, if organized labor is very weak, such that wages are low and unemployment is high,

¹ [Um, it wasn't really "continued." In the postwar era of developmentalism, import-substitution industrialization was the agenda in many countries. But then, apparently, a return to export promotion occurred from the 1970s on.]

effective demand might be insufficient to justify high levels of investment, and stagnation sets in. (What are the mechanisms that would lead to recovery? I guess Keynes' point was that there are only *external* mechanisms, such as government spending.) The Great Depression and the current stagnation fall, at least in part, under the latter category. (With the present stagnation there is also the problem of global overproduction-relative-to-prevailing-profit-rates, as Brenner says. This has been one cause of the insufficient demand, in that it has forced capitalists to cut costs.) The stagnation of the 1970s, on the other hand, was apparently in part the result of a profit-squeeze in the context of global overproduction. Hence business's and the government's attacks on organized labor—which, as I just said, led to the low demand of the present. This time, though, there probably isn't going to be a revival of labor unions and massive government spending, as there was in the 1930s and '40s. Instead there is going to be a slow collapse of capitalism, starting in the advanced countries. Will growth in developing countries come to the rescue? Doubtful.

...Harvey likes Baran and Sweezy. "If it takes competition to keep the permanent expansion of production going, then it follows that keeping capitalism competitive is also necessary to capitalism's survival." That's a sensible argument for Sweezy's interpretation of monopoly capitalism. The implication is that "any slackening of competition through, for example, excessive monopolisation will in itself likely produce a crisis in capitalist reproduction." The logic is pretty compelling. But it could be too simple. Harvey even attributes the stagflation of the 1970s to tendencies toward monopolization and the centralization of capital. Is that plausible? I suppose so, to an extent. But it doesn't seem *specific* enough—specific enough to the conditions of the '70s. On the basis of his Sweezyan interpretation, Harvey goes on to say that "The neoliberal counter-revolution that then occurred [after the 1970s] not only had to smash the power of labour; it had also to unleash the coercive laws of competition as 'executor' of the laws of endless capitalist accumulation." Neoliberalism unleashed competition? Hm. Maybe. But Brenner would prefer to say it was a response to competition—foreign competition.

Here's a possible compromise: heightened international competition in a global context of "monopoly capital" had the consequences that Brenner documents. (Incomplete "shakeout" of relatively unprofitable firms, enormously increased levels of government- and consumer-debt, lack of a genuine crisis (which would cleanse the economy of the least profitable companies) but instead prolonged stagnation, etc.)

Anyway, Harvey's formulations in general are illuminating. His whole explanation of economic activity revolves around capitalism's requirement that capital accumulation flow continuously. "The continuity of flow must be sustained at all times." He emphasizes this again and again. Accumulation is always looking to overcome barriers and limits. If it hits a limit of some sort, problems arise, sometimes leading to crisis. One essential role of the credit system is to stave off for a while "the problem of falling profits and devaluations [of capital] due to lack of effective demand"—but over the long term this tends to accumulate the system's contradictions and tensions, spreading the risks at the same time that it accumulates them. Credit has to grow at a compound rate (because capital accumulation occurs at a compound rate), "as indeed happened over the last twenty years. When the credit bubble bursts, which it inevitably must, then the whole economy plunges into a downward spiral of the sort that began in 2007. And it is at this point that capitalism has to create external power in order to save itself from its own internal contradictions." So it turns to the Federal Reserve, which has a power of infinite money creation.

Harvey opposes all attempts to look for one dominant explanation for the crisis-prone character of capitalism. "The three big traditional camps of thought are the profit squeeze (profits fall because real wages rise), the falling rate of profit (labour-saving technological changes backfire and 'ruinous' competition pulls prices down), [and] the underconsumptionist traditions (lack of effective demand and the tendency towards stagnation associated with excessive monopolisation)." Adherents of one school often insist that the others are simply wrong.

There is, I think, a far better way to think about crisis formation. The analysis of capital circulation pinpoints several potential limits and barriers. Money capital scarcities, labour problems, disproportionalities between sectors, natural [environmental] limits, unbalanced

technological and organisational changes (including competition versus monopoly), indiscipline in the labour process and lack of effective demand head up the list. Any one of these circumstances can slow down or disrupt the continuity flow and so produce a crisis that results in the devaluation or loss of capital. When one limit is overcome accumulation often hits up against another somewhere else. For instance, moves made to alleviate a crisis of labour supply and to curb the political power of organised labour in the 1970s diminished the effective demand for product, which created difficulties for realisation of the surplus in the market during the 1990s. Moves to alleviate this last problem by extensions of the credit system among the working classes ultimately led to working-class over-indebtedness relative to income that in turn led to a crisis of confidence in the quality of debt instruments (as began to happen in 2006). The crisis tendencies are not resolved but merely moved around.

One barrier to accumulation is repositioned at the expense of another. The crises that result are *necessary* ways of rationalizing (temporarily) an irrational, contradictory system. They are “as necessary to the evolution of capitalism as money, labour power, and capital itself.”

“A synoptic view of the current crisis would say: while the epicentre lies in the technologies and organisational forms of the credit system and the state-finance nexus, the underlying problem is excessive capitalist empowerment vis-à-vis labour and consequent wage repression, leading to problems of effective demand papered over by a credit-fuelled consumerism of excess in one part of the world [the West] and a too-rapid expansion of production in new product lines in another [much of Asia?].” Similar to Brenner (and probably a galaxy of other Marxists). Seems obviously true.

Harvey has an interesting discussion of urbanization as one of the primary ways of absorbing capital surplus. As long ago as the 1850s, governments used massive infrastructural investment for this purpose, in other words to rescue society from its economic doldrums. The Europe-wide economic crisis of 1848, which contributed to the political upheavals of that year, was a crisis of “unemployed surplus capital and surplus labour existing side by side with no clear way to put them back together again.” In France, the republican bourgeoisie failed to resolve the problem; only after Louis Napoleon became emperor was the solution hit upon, namely a huge Keynesian-style program of infrastructural investment at home and abroad, directed by Baron Haussmann. It entailed the reconfiguration of Paris’s urban landscape, which helped stabilize society by employing vast quantities of labor and capital. Paris was transformed, becoming “the city of light”—and of consumption, tourism, and pleasures galore. New financial institutions and debt instruments were used to allocate capital, and apparently they worked well....until the whole speculative financial system and its credit structures collapsed in the crisis of 1868.

A later example is the U.S. in the 1940s, ’50s, and ’60s. The war lifted America out of the depression, but what was going to happen after the war? In order to contain radical social movements, two things were necessary: repress them (as Napoleon III had in the 1850s), and solve some of the problems that had given rise to them. New ways had to be found to absorb surplus capital and so keep the economy going. Federal, state, and local governments effectively adopted Bonaparte’s solution: invest in colossal projects of remaking metropolitan spaces. The “master builder” Robert Moses, a sort of Baron Haussmann of his day, is still the symbol of all this, all the resultant debt-financed highways and infrastructural transformations, the suburbanization, the urban renewal, and so on. “Where would the capital surplus have gone,” Harvey asks, “had it not been for the making of the New York metropolitan region, Chicago, Los Angeles and other places of their ilk after 1945?” All this investment across the country, supplemented by tax subsidies for home ownership, the GI bill, “productivity agreements” between capital and labor, etc., was crucial to stabilizing not only the U.S. economy but U.S.-centered global capitalism. It also made possible the maturation of Fordist mass consumerism, thus changing people’s lifestyles.

Of course there were costs, as you know. The dismantling of public transportation, the destruction of old urban neighborhoods and the hollowing-out of city centers, the U.S.’s dependence on the Middle East for much of its oil, the degradation of the natural environment, the urban crisis of the 1960s, etc. Hence,

in part, the radical backlash of the 1960s. Another consequence, Harvey argues, was the weakening of the dollar because of excessive U.S. borrowing, and thus ultimately the collapse of the Bretton Woods system.

“After the 1970s, urbanisation underwent yet another transformation of scale. It went global. The urbanisation of China over the last twenty years has been hugely important.” China’s urbanization has in fact been partially responsible for the stabilization of global capitalism. Think of all the demand it has generated! But China is really only the epicenter of the global phenomenon of debt-financed urbanization projects. I won’t list the dozens of cities everywhere, many of them in America, that have been the sites of building booms. And this new wave of urbanization has depended, “as did all those before it, on financial innovation to organise the credit required to sustain it. The securitisation and packaging of local mortgages for sale to investors worldwide, and the setting up of new financial institutions to facilitate a secondary mortgage market, have played a crucial role.” All these developments in the financial sector had the positive effects of bringing aggregate interest rates down and spreading risk. In the end, though, what happened in the financial crisis of 1868 in Paris and in New York City in 1975 (when it [almost] went bankrupt due to all its debt) and in many other places and times happened again in the subprime mortgage and housing asset value crisis.

What happened in Paris in the 1850s and across the U.S. in the postwar era has lately been happening all over the world: undesirable or economically redundant people are being brutally pushed out of the way by states and businesses seeking to create or “renew” urban areas. Earth is becoming a planet of slums. And social movements are taking up arms everywhere.

One other thing: landowners have taken an active role in pushing all this urban development, because it raises the value of their property and thus the rents they can charge. “The power of land and resource owners has been much underestimated, as has the role of land and resource asset values and rents in relation to the overall circulation and accumulation of capital. This arena of activity accounts for as much as 40 percent of economic activity in many of the advanced capitalist countries.” Wow. That’s a lot of parasites.

...What it comes down to is that compound economic growth forever is not possible. In a finite world, capital accumulation at a compound rate has to end eventually. Crises that restore growth by destroying or devaluing excess capital can only postpone the inevitable, not prevent it from happening.

Harvey notes that, broadly speaking, two different kinds of responses have evolved to the current economic downturn. On the one hand is the West, with its policies of deficit reduction through austerity. I.e., lower standards of living for most people, etc. On the other hand is the East and the emerging markets of the South, which are following an expansionary Keynesian strategy. In China there is massive investment in infrastructure combined with moderate empowerment of labor (higher wages, etc.), resulting in an increase of demand that gives a boost to the export economies of Latin America, Southeast Asia, Germany, and so on. —History’s twists and turns are fascinating! The erstwhile victors rot from the internal contradictions of the economic system that made possible their global domination, while the erstwhile victims *rise* by virtue of the dynamics of this system that ground them under its boot for so long. Poetic justice! The formerly “independent” economies come to depend more and more on their former dependencies. But ultimately it’s all unsustainable anyway.

Tonight I looked through a lot of photographs, letters, and notes from many years ago. All those memories.... People from my past, now only memories buried in scar-tissue. So I sat there, immobilized by emotions. (Appropriately but coincidentally, my family and I watched the movie *2046* later. No escaping the past, only pale attempts to recapture it or heal its wounds.) Wrote a short, sad email to Zhilan. [...]

2046. All the women in the man’s life—time measured by women, women flowing by like time—but no linear time at all, only a sort of swirling around endlessly a void in concentric circles, or a spiral, or rather a fog of avoided memories that prevents you from seeing clearly. (Yes, the void, the first and last image of *2046*.) Time measured by the ebb and flow of longing, and the compulsive repetition of loneliness. “All memories are traces of tears.” You peer back through the fog of upwelled memories and see....human androids as in the film, secrets unshared, time-slices of attempts to share secrets, traces of kisses and stronger traces of loss. All the women in my life.... The imagined women....

Books I'm reading or half-reading for my two courses this semester (Latin America and World History): Alejandro de la Fuente, *Havana and the Atlantic in the Sixteenth Century* (2008); Steve Stern, *Peru's Indian Peoples and the Challenge of Spanish Conquest: Huamanga to 1640* (1993); Stuart Schwartz, *Sugar Plantations in the Formation of Brazilian Society: Bahia, 1550-1835* (1985); Gregory Cushman, *Lords of Guano* (2012); Paul Gootenberg, *Andean Cocaine: The Making of a Global Drug* (2008); Emilio Kouri, *A Pueblo Divided: Business, Property, and Community in Papantla, Mexico* (2004); Gillian McGillivray, *Blazing Cane: Sugar Communities, Class, and State Formation in Cuba, 1868-1959* (2009); Jeffery Paige, *Coffee and Power: Revolution and the Rise of Democracy in Central America* (1997); John Soluri, *Banana Cultures: Agriculture, Consumption, and Environmental Change in Honduras and the United States* (2005); Greg Grandin, *Fordlandia: The Rise and Fall of Henry Ford's Forgotten Jungle City* (2010); Myrna Santiago, *The Ecology of Oil: Environmental, Labor, and the Mexican Revolution, 1900-1938* (2009); Suzana Sawyer, *Crude Chronicles: Indigenous Politics, Multinational Oil, and Neoliberalism in Ecuador* (2004); Elizabeth Fitting, *The Struggle for Maize: Campesinos, Workers, and Transgenic Corn in the Mexican Countryside* (2010); Martin Lewis and Karen Wigen, *The Myth of Continents: A Critique of Metageography* (1997); Jerry Bentley, *Old World Encounters: Cross-Cultural Contacts and Exchanges in Pre-Modern Times* (1993); Marcus Rediker, *The Many-Headed Hydra: Sailors, Slaves, Commoners, and the Hidden History of the Revolutionary Atlantic* (2001); Janet Abu-Lughod, *Before European Hegemony: The World System A.D. 1250-1350* (1991); James C. Scott, *Seeing Like a State: How Certain Schemes to Improve the Human Condition Have Failed* (1998); Geoff Eley and Ronald Suny, eds., *Becoming National: A Reader* (1996); Walden Bello, *The Food Wars* (2009). Also a lot of articles. And for the class I'm TAing: John M. Thompson, *Russia and the Soviet Union: An Historical Introduction from the Kievan State to the Present* (2009).

Most of the arguments in *The Myth of Continents: A Critique of Metageography* (1997), by Martin Lewis and Karen Wigen, are fairly convincing. It is undeniable that such concepts as "East and West," "Orient and Occident," and even the sevenfold continental system are cultural constructs that have no clear objective referents. They are mere conveniences, and their mutual delimitations are to some extent arbitrary. Over the last five hundred years the accepted meanings of these geographical schemes have changed many times, as the authors demonstrate. Moreover, thinking in these simplistic binary and continental terms can cloud one's understanding of the world—of its diversity and of the many parallels between "Eastern" and "Western" societies (as well as African, Asian, European, American, etc.)—and thereby perpetuate myths, stereotypes, and prejudices. Postmodernists can be just as guilty of these sorts of reifications as old-fashioned Eurocentrists. However, it's possible that the authors go a little too far in their third chapter, "The Cultural Constructs of Orient and Occident, East and West," in rejecting traditional notions of how Western Europe has differed from China, for example, and India. Doubtless it is absurd to identify "the West" simply with reason, progress, freedom, dynamism, individualism, and materialism, and "the East" with the opposites of those concepts. I will argue, though, that, if qualified, similarly sweeping contrasts are not wholly off the mark.

It is worth noting, first of all, that to reject out of hand ideas that attracted some of the greatest minds in Europe, America, and parts of Asia for over two hundred years seems intellectually lazy. Thinkers from Voltaire to Hegel to Marx to Weber and beyond have contrasted European societies with Asian societies. At the very least, one has to explain how it was possible for them *all* to have been so horribly wrong. One has to theorize the phenomena that misled them. But of course it is silly to say that they were all simply *wrong*; rather, they grasped certain truths in perhaps exaggerated ways. In recent decades, as countries in the so-called East and Middle East have become deeply capitalist, the old notions of Oriental stagnation, despotism, spiritualism, scientific non-rationality, and so forth, have lost whatever plausibility they once had. Nonetheless, from at least the late eighteenth to the mid-twentieth century, Western Europe and North America were clearly more rapidly developing, more culturally individualistic, and more

scientifically progressive than the so-called Orient—because they were far more intensively capitalist.¹ Not even Lewis and Wigen deny this. Whether Europe and America in this period were also more *democratic* and *free* (politically and culturally liberal, etc.) than the “Orient” is a difficult question, but a strong case can be made that the answer is yes.

The natural question then is, “Why did Western Europe become dominated by capitalist production relations before other societies did?” The authors do not answer this question, but they treat several important elements of an answer in a rather dismissive way. “Carlo Cipolla,” they note, “powerfully argues that the tradition of urban self-government, based essentially on merchant and craft-guild oligarchies, was uniquely European, and, more important, that its emergence in the High Middle Ages represented nothing less than ‘the turning point of world history.’” Cipolla also maintains that Europe was unique in the high social position it afforded members of the medical, legal, and notarial professions.” After conceding the importance of these points, they state with no explanation, “Cipolla probably grants them more significance than they deserve.”² It is quite possible, however, that these phenomena both were largely unique to Europe and contributed to the rise of capitalism.

Similarly, Lewis and Wigen deny that “parcelized sovereignty,” which has often been thought to have played an important role in Europe’s development, was truer of Europe than elsewhere. They argue that governments throughout Eurasia were not as centralized, despotic, or powerful as we are wont to think, that instead they were “segmentary” in structure and “had to come to terms with local power holders.”³ Even if this is true, though, the sort of parcelized sovereignty it indicates is different from the European proliferation of autonomous states in a relatively small area. It is this kind of political fragmentation that was surely most conducive to European development. It meant, for example, that Columbus could roam the continent in search of a political sponsor, trying Portugal, Genoa, Venice, England, and finally Spain. An adventurer in China had no such options. Competition between states also stimulated the advance of military technology in the late Middle Ages and early modern period. Even more importantly, the differences in political, economic, and environmental conditions between Britain and the rest of Europe caused feudalism to decline first in Britain and industrial capitalism to rise.⁴ In addition, the growth of relatively autonomous cities in the Middle Ages, sometimes governed by merchant oligarchies (as in northern Italy), helped make possible the Renaissance, which provided the cultural context for the printing revolution, which was a precondition for the Reformation, the Scientific Revolution, and ultimately the Industrial Revolution. All these consequences flowed, in part, from Europe’s unusual political fragmentation [and parcelized sovereignty].⁵

Lewis and Wigen also dismiss Marx’s concept of the “Asiatic mode of production,” an idea that has been, or used to be, taken seriously by generations of Marx-influenced thinkers and scholars. Were they all totally deluded? Was the Asiatic mode of production merely a figment of their imagination? Again, at the very least it is necessary to theorize the things that supposedly misled them, not just to say “They were

¹ [Next to this word (and many others throughout the paper) the professor wrote, “Meaning what?” Hopefully the reader knows what I meant: relative predominance of the capitalist mode of production (viz., wage-labor vs. capital owners), competitive capital accumulation, a more deeply “marketized” economy, and so on.]

³ *Ibid.*, 99.

⁴ See Robert C. Allen, *The British Industrial Revolution in Global Perspective* (New York: Cambridge University Press, 2009).

⁵ [Barrington Moore says the following (on p. 174 of his major book): “Imperial Chinese society never created an urban trading and manufacturing class comparable to that which grew out of the later stages of feudalism in Western Europe, though at times there were some starts in this direction. Imperial success in uniting the country may be advanced as one of the more obvious reasons for the difference. In Europe the conflict between Pope and Emperor, between kings and nobles, helped the merchants in the cities to break through the crust of the traditional agrarian society because they constituted a valuable source of power in this many-sided competition.” In other words, kings, nobles, emperors, and popes had an incentive to let relatively autonomous cities thrive. Very different from China. Parcelized sovereignty, you see.]

wrong” and leave it at that. Moreover, it does not strike me as ridiculous to argue that private property in land gave modern European landowners—under particular economic conditions—an incentive to improve agricultural productivity and expel peasants from the land (contributing to the rise of a proletariat), whereas the absence of a legally protected system of private property in China and India, where land was often in effect possessed by the state, prevented such capitalist incentives from emerging. More generally, one would think that the absence, or at least the profoundly limited power (compared to that of the state bureaucracy), of a private landowning class would make for a very different society from that in which such a class had immense power, as it did in medieval and modern Europe. Even if, as Lewis and Wigen argue, the “Oriental” state was not as despotic as Marx thought, the concept of an Asiatic mode of production could still be suggestive, as could the thesis of a relatively cyclical Asiatic history (compared to Europe’s). Indeed, *prima facie* this latter hypothesis seems obviously true. A cursory glance at the last 2200 years of Chinese history [except the last 150 years] reveals that, aside from invasions and dynastic struggles, China has had a more stable social order than Europe. Postmodernists like Lewis and Wigen appear not to notice this, so they don’t try to explain it. But it does beg for an explanation.

Some arguments in chapter three of *The Myth of Continents* are very plausible. For instance, it is misleading to identify Western culture with reason or rationalism, because religion and various forms of irrationalism have been at least as prominent throughout its history. The authors quote William McNeill approvingly: “The striking transformation of the culture of the Roman world from the naturalism and rationalism of Hellenism to the transcendentalism and mysticism of the fifth and sixth centuries had no real parallels elsewhere in the [Afro-Eurasian] ecumene.... Unusual instability, arising out of a violent oscillation from one extreme to another, may in fact be the most distinctive and fateful characteristic of the European style of civilization.”¹ Again, though, such instability has to be explained, and if it is distinctively European (as McNeill claims), the explanation is going to have to postulate significant differences between European and Asian societies. Moreover, environmental factors—which many historians prefer not to invoke because they supposedly justify “Eurocentrism”—will probably play a role in the explanation.

The point is that sometimes it is justifiable to make generalizations about “the West” and “the East,” or at least parts of the East, and that there *are* major historical differences between societies that exemplify the West and the East. At the same time, *The Myth of Continents* serves as a useful reminder that we should be cautious in our generalizations.

Alejandro de la Fuente’s *Havana and the Atlantic in the Sixteenth Century* (2008) is a close study of Havana during its formative period, in the latter half of the sixteenth and beginning of the seventeenth centuries. As the author notes, historians have given a lot of attention to the functioning of Atlantic trading networks in the eighteenth century, in particular those associated with the slave trade; less attention has been paid to the Spanish imperial system in the sixteenth century, and still less to the history of specific “imperial outposts” such as Havana. In light of the paucity of colonial sources, this is not surprising. De la Fuente, however, makes very profitable use of such sources as notarial records, town council records, and parish registries—so much so, in fact, that the resultant picture of Havana is at times tedious in its incredible detail. Underlying the author’s intricate reconstruction of the town in its era of growth is a polemical purpose: he argues that historians have been mistaken to see Havana in this period as merely an imperial military outpost at the service of Spain’s merchant fleets. While that was the function assigned it by Spain’s imperial planners, the lived experience of the town was much richer and in constant tension with the one-dimensionality of its prescribed role.

Havana indeed was catapulted in size and vitality during the years de la Fuente studies. From a town of only 30 vecinos, or heads of household, in 1553, and only 60 in 1570, Havana grew to 1200 vecinos in 1620. At the same time, the city’s service economy grew tremendously; massive new fortifications were built; African slaves and their descendants came to represent nearly half of Havana’s population; and the city “created [an agricultural and mining] hinterland to serve its needs” (p. 118). All this resulted from the fact that Havana was the port at which merchant fleets gathered before and after their trips across the

¹ Lewis and Wigen, *The Myth of Continents*, 86.

Atlantic. Because of its privileged location and function, the city was also granted numerous concessions from the crown, including tax exemptions, loans, subsidies, and the town council's unrestricted ability to distribute land. Some farms produced foodstuffs, such as cassava, for local demand; large ranches proliferated for raising pigs and cattle; lumber was produced for export, shipbuilding, and to meet local needs; copper mining occurred in eastern Cuba, and Havana became one of the most important shipbuilding centers in the Spanish Atlantic; and sugar was produced on plantations [and in mills] by African slaves, though not on anything like the scale of two centuries later. De la Fuente remarks that, while Havana was unique among port cities in having created a hinterland rather than being created by it, sugar pointed the way to a future in which the port would serve the needs of the hinterland, i.e. of plantation slavery and monoculture.

Appropriately, the book starts off with discussions of the port and the fleet system that determined Havana's rise, shaped its urban landscape, and created a service economy to provision the ships and cater to the needs of crews and passengers. The succeeding chapters fill out a progressively richer picture of the city and its place in the Atlantic economy. Havana's growth accelerated after the 1570s, in large part due to policies designed by the Crown to augment the population and bolster the city's defenses against pirates. The chapter on "Production" extends the analysis to the city's hinterland and its growing manufacturing sector, describing the rise of agriculture, shipbuilding, and sugar production. This leads seamlessly into the next chapter, "Slavery and the Making of a Racial Order," in which de la Fuente traces the processes through which race became a fundamental organizing principle of Cuban life. As is true throughout the book, the author makes a major contribution to scholarship here in the remarkable *detail* of his analyses. He looks closely at—among other things—the ways in which slaves were bought and sold, their prices, the diversity of occupations they engaged in (often working alongside poor whites), their culture and adaptation to life in Havana, the practices relating to manumission, and the many regulations local elites imposed in order to create a racially stratified society. In general, de la Fuente confirms what scholars have long known, that to be a slave in Cuba was not quite as horrible a fate in the sixteenth century as it later became.

The last chapter (aside from the Epilogue) consists of a typically rich and nuanced analysis of the changes that occurred in Havana's social structure as a whole between the 1550s and 1610s. Traditional social hierarchies based on the old medieval society of orders proved impossible for elites to fully re-create in the New World, especially in port cities like Havana. As the author notes, "Port cities experienced a constant demographic turnover and housed large transient populations, elements that did not contribute to the reproduction of traditional links of deference" (p. 187). Because of its centrality to the Caribbean and Atlantic economy, Havana in particular became a fluid and dynamic society. As throughout, an especially valuable aspect of de la Fuente's discussion is his illustration of the extent to which Havana was a creation of trade.

Broadly speaking, one of the author's main goals in *Havana and the Atlantic in the Sixteenth Century* is to transcend the traditional "Eurocentric, British-centered vision" of Atlantic colonialism, in other words to fulfill the potential of the relatively new field of Atlantic history by "transcend[ing] national and imperial boundaries" (p. 226). From this perspective, the decision to study Havana was an apt one, given that by 1610 the city "had become a collection of African and European 'nations' living by the sea" (p. 107). De la Fuente's masterful reconstruction of how this cosmopolitanism came about and what it looked like is the book's chief merit, and ensures that it will be a standard work for a long time to come.

The history of cocaine intersects with major topics in modern history, including, among others, Latin American and U.S. politics, American imperialism, indigenous peasant life in the Andean region, America's Progressive movement in the early twentieth century, the two world wars, the modern drug war, the history of medicine, and popular culture in the West. Remarkably, Paul Gootenberg delves into all these topics and many, many more in his ambitious book *Andean Cocaine: The Making of a Global Drug* (2008). As he states, the book's main contribution "lies in its systematic effort to tie together the disparate global threads of cocaine's history, using the hitherto unknown story of Andean cocaine as the central strand" (p. 6). He takes a Peruvian perspective in part because he wants to emphasize Peruvians' agency in the construction of the cocaine industry. The fact, moreover, that Huánuco, Peru is the drug's "historical

homeland and haven” is in itself sufficient justification for framing a study around this region, as Gootenberg does. While Latin Americanists and specialists in “the new drug history” (as Gootenberg calls it) will be fascinated by this work, its recounting of cocaine’s history from the late nineteenth to the late twentieth centuries is of such interest that even non-specialists will surely find it engrossing.

Gootenberg divides the history of cocaine into three periods: first, the drug’s birth as a successful medical commodity between 1850 and 1910; second, its decline from 1910 to 1945; and third, its reemergence as an *illicit* good between 1945 and 1975. Throughout, its story has been a decidedly transnational one. For example, it was a German doctoral student who, in 1860, isolated alkaloidal cocaine from the coca leaf that had been pivotal in Andean cultural history for millennia. Over the next few decades, but especially after the mid-1880s, German, French, British, and American scientists experimented with cocaine—and the coca leaf—to discover its practical applications, which included its use as a stimulant, an anesthetic, an antidote for stomach and respiratory ailments, and, in the case of coca, an antidote for the era’s widespread “neurasthenia.” Coca was also used in various beverages, including, after 1886, Coca-Cola. In these years, too, a Peruvian “nationalist science” emerged around coca and cocaine, based on the idea that these were national commodities—Peru’s gifts to the world—“modernizing goods” that would help integrate the country into the Western world. The Franco-Peruvian pharmacist Alfredo Bignon contributed immensely to cocaine’s later future by inventing a method for extracting so-called crude cocaine in the same places as coca cultivation, whereas previously coca leaves had had to be shipped abroad first, which created supply bottlenecks and other problems. Bignon’s invention made possible the birth of a true Peruvian cocaine industry.

The industry’s heyday did not last long, however. After about 1905, several factors combined to undermine it. First, more efficient coca production in Java, organized and controlled by the Dutch, cut into Peru’s markets. Second, medical opinion turned against cocaine because of its dangerous side-effects and the discovery of alternative anesthetics. Third, the U.S. went from being cocaine’s main consumer market to leading a global crusade against it. The reasons for America’s dramatic shift in this respect are not entirely clear, as Gootenberg admits, but he gives a plausible explanation. Physicians and pharmacists sought to rein in use of the drug after becoming fully aware of its dangers and recreational possibilities, and local laws against it proliferated partly for this reason. At the same time, the popular demonization of the “cocaine fiend” spread, especially due to the drug’s association with African Americans. In addition, the Progressive movement seized on cocaine as a symbol of the power and greed of pharmaceutical corporations—which, however, joined the anti-cocaine crusade in order to maintain their clean image. In any case, by the 1920s a uniquely harsh anti-drug regime had evolved in the U.S., which fought to extend that regime all over the world. Until after World War II its success was limited, the League of Nations more or less tolerating the legal international cocaine trade. Still, both the drug and its source the coca leaf suffered gradual delegitimization—even, to an extent, in Peru—in the interwar era.

Because of its absolute world dominance after the Second World War, the U.S. was finally able to consummate its anti-cocaine crusade, in part by using the UN as its tool. Gootenberg’s discussion of the postwar period is masterful. The task he sets himself is forbidding: he aims to describe how the U.S. tried to extirpate the cocaine trade everywhere on the planet but how its efforts in Latin America backfired by the 1960s, leading to the explosion of an illegal commerce that would come to dwarf the earlier legal one. Along the way, he describes in some detail the roles that Peru, Brazil, Ecuador, Cuba, Argentina, Mexico, Panama, Bolivia, Chile, and finally Colombia played in the rise of illicit cocaine, as well as how the drug’s destiny intersected with the Cold War, the “war on drugs” that Nixon inaugurated, and American popular culture in the 1970s and 1980s. With regard to the criminal actors themselves, Gootenberg focuses—wisely—not so much on the Pablo Escobars as on the earlier and lesser known trailblazers. One wishes he had devoted more attention in this final part of the book to the central question of why the cocaine industry has proven so resilient in the Andean region, but he does raise the issue and speculate plausibly on answers.

In his conclusion Gootenberg remarks, aptly, that “the subject of Andean cocaine has been viewed here through a dizzying array of lenses” (p. 323). This statement can be made the basis of a criticism, that the book is downright bewildering in its lack of focus. It touches on so many issues that the reader gropes for a central argument. There are, nonetheless, unifying threads, in particular Gootenberg’s fusion of the

local and the global so as to create a sort of dialectic of Peruvian agency in the context of powerful transnational forces. Considering his emphasis on agency, Gootenberg could have gone into much more depth on the nature of production relations on coca plantations, and the lives of workers. This, however, would have been to add even greater length to a book that already threatened to get out of hand. Despite its flaws, *Andean Cocaine* is an excellent work—a good read and a product of admirable scholarship—which historians of all persuasions will appreciate.

The historian of Central America's civil wars in the 1980s faces an obvious question from the outset: what explains the divergent experiences of the countries in the region? Jeffery Paige frames his study *Coffee and Power: Revolution and the Rise of Democracy in Central America* (1997) around this question; in particular, he wants to explain why the ideology and behavior of the respective elites differed so profoundly. He focuses on El Salvador, Nicaragua, and Costa Rica (the only country that did not succumb to civil war), tracing the origins of their experiences in the 1980s back to the 1930s and even earlier. "The revolutionary crises of the 1980s," he argues, "were crises of the coffee elites and the societies they made at the end of the nineteenth and the beginning of the twentieth centuries" (p. 5). While he is most concerned with elite ideology, such that the bulk of his empirical research consists of interviews with members of the coffee elite conducted while the civil wars were raging, he devotes much of his book to analyses of the economic and political structures of each country as crystallized in the 1930s and 1940s. It is all expressed in Marxian terms, as Paige both adopts and critiques the framework that Barrington Moore puts forward in *The Social Origins of Dictatorship and Democracy*.

Crucial to Paige's analysis of the civil wars is his distinction between two fractions of the coffee elite in each country: the agrarian fraction, i.e. the landowners who organize production, and the agro-industrial fraction, which controls processing and export. "The more land the elite control[s] or the more productive its system of growing coffee, the more powerful the agrarian fraction of the coffee elite.... The greater the technological and commercial development of processing and exports under elite control, the stronger the agro-industrial fraction" (p. 57). As implied by Moore's model, the agrarian fraction tends to be the more reactionary and authoritarian because of its reliance on "labor-repressive agriculture." According to Paige, the countries' different histories in the last century have been a consequence largely of the different degrees of power each fraction has had. Until at least the 1980s, he argues, the Guatemalan elite was overwhelmingly agrarian: "debt servitude, serfdom, and other forms of legal bondage created class relations similar to those of the European feudal manor: the Spanish and European immigrant landlord class ruled over an unfree Indian labor force" (p. 87). In El Salvador, the agrarian fraction benefited from an efficient production system, although the agro-industrial fraction was also quite strong. Costa Rica's elite was characterized by a weak agrarian fraction, due to the proliferation of small farmers. In Nicaragua, for a long time neither fraction was very highly developed because U.S. intervention in the early twentieth century and then the Somoza dictatorship interrupted economic development. Only in the postwar period, with the development of a mechanized cotton and sugar economy, did the agro-industrial class gain disproportionate power.

Applying Paige's ideas, Costa Rica's social democratic state was made possible by the presence of many small farmers and the dominance of agro-industrialists in the economy; El Salvador's ferocious civil war resulted from the great power of its agrarian elite, which tended to support the death squads and the hardliners in the military; and the Sandinistas were able to come to power in Nicaragua because a large portion of the agro-industrial fraction hated Somoza so much that it supported them (although later it turned against them). In the end, neoliberal democracy emerged in each country because agro-industrialists split from agrarians to support it—just as Moore's model predicts would have to happen. Paige argues, however, that in a sense Central America discovered a historically new route to democracy: through "socialist revolution from below," which is what finally forced the split between the hitherto-united agro-industrial and agrarian fractions.

The heart of the book is the discussion of the elite's ideology, specifically its evolution from a statist version of liberalism (which incorporated anti-communism after the 1930s) to—among agro-industrialists—neoliberalism in the late 1980s. Paige recounts the events of the 1930s and 1940s that

hardened each country's ideology around a central "myth" or "narrative": in the case of El Salvador's elite it was the idea of *progress*, in that of Nicaragua's it was the idea of *liberty* (the freedom to buy and sell without interference from the government), and for Costa Ricans it was *democracy*. In his examination of the narratives that emerged from his interviews, Paige fruitfully applies Fredric Jameson's theory of the political unconscious, the essence of which, "like Marx's theory of ideological mystification, is that resolutions in the narrative [or ideological] order depend on resolutions of real contradictions in the social order" (p. 359). For example, Paige argues that part of the unsayable "political unconscious" of the old order was the contradiction that two classes—agro-industrialists and authoritarian landowners—were fused into one unified elite; this contradiction was resolved when the revolutionaries of the 1980s effectively forced a split between the two, which eventuated in the triumph of the agro-industrialists' neoliberal vision in the 1990s.

On the whole, *Coffee and Power* is an excellent book. One might argue, however, that Paige's focus on ideology or "narratives" is misplaced, and that the most interesting parts of the book are the analyses of class relations and politics. Paige seems to sense this, for after his long discussion of the elite's self-perception he asks the important question whether narratives matter at all. "Is there anything that the narratives and their ideological distortions add to our understanding of the transformation of Central American society that is not equally well or better rendered by close attention to the underlying transformations in class relations and politics?" (p. 355). He concludes that there is, that political behavior is not solely an expression of economic interests. He is surely right about this; nevertheless, whether his long exposition of elite ideology is really worth it remains an open question. That aside, the book is fascinating, well worth reading and rereading. It is in the tradition of Marx's *Eighteenth Brumaire of Louis Bonaparte*, in terms of its materialism, its sophistication, and its profundity.

The Food Wars (2009), by Walden Bello, presents both a damning indictment of the neoliberal world food system and a vision of an alternative system based on small-scale agriculture, which Bello argues can be more efficient, socially responsible, and environmentally sustainable than capitalist industrial farming. Indeed, according to Via Campesina, such alternative agriculture (and hunting and gathering) is responsible for most of the world's food.¹ Not only is it an ideal, therefore; it is an incredibly important reality. However, Bello does not really *theorize* the hoped-for supplanting of corporate monoculture by what he calls "peasant" agriculture; he simply says, or implies, that Marxists have been wrong to predict the end of the peasantry, that instead this category of producers can represent the post-capitalist future. In this paper I will provide some of the theory that is lacking in *The Food Wars*.

In my Master's thesis, entitled *Worker Cooperatives and Revolution: History and Possibilities in the United States*,² I tried to update Marxism, specifically its outmoded theory of revolution, so as to explain how a transition to a post-capitalist civilization could occur. The essence of the revision is the replacement of Marx's statist vision—his prediction of a dictatorship of the proletariat that plans and directs social and economic reconstruction from above—by a more grassroots-oriented, quasi-anarcho-syndicalist vision, according to which decentralized [or *relatively* decentralized] networks of workers, farmers, consumers, and communities gradually build up the new society within the shell of the old. Ironically, this anarchist vision is, I think, more compatible with the fundamental tenets of Marxism than Marx's own statism is, for several reasons, of which I will mention two. First, the idea of a state organizing a new, egalitarian mode of production in a society that, after a merely *political* revolution, is still dominated by authoritarian capitalist relations of production, is inexplicable in Marxian terms. According to Marxism, after all, political relations are conditioned by economic relations; the state cannot simply organize a wholly new economy out of thin air, purely by an act of bureaucratic will. That would reverse the order of dominant causality. Given an already existing authoritarian economy (namely capitalism), the "new" economy organized by the post-revolutionary state will necessarily be authoritarian as well, in fact will reproduce many of the

¹ Via Campesina, "Sustainable Peasant and Family Farm Agriculture Can Feed the World" (Jakarta: September 2010), p. 5, at <http://viacampesina.org/downloads/pdf/en/paper6-EN-FINAL.pdf>.

² Available at http://scholarworks.umb.edu/cgi/viewcontent.cgi?article=1020&context=masters_theses.

essential relations of the old economy. This is what happened in the Soviet Union, when the Stalinist bureaucracy organized an economy based on the exploitation of workers, the accumulation of capital, and other essential features of capitalism. Socialism means workers' control of their own economic activity, which is the exact opposite of both capitalism and the Soviet economy. What has to happen, in other words, according to a properly understood Marxism, is that the economy be substantially transformed—in a gradual process—*before* any political revolutions,¹ as was the case during Europe's transition from the feudal to the capitalist mode of production. (The French Revolution, for example, happened after capitalism had already made significant progress in France.) The same will have to be the case with regard to a transition from capitalism to a properly understood socialism.

Second, Marx theorizes social revolution in terms of the “fettering” of productive forces by an obsolete mode of production. As he says in the famous Preface to the *Contribution to the Critique of Political Economy* (1859),

At a certain stage of development, the material productive forces of society come into conflict with the existing relations of production or – this merely expresses the same thing in legal terms – with the property relations within the framework of which they have operated hitherto. From forms of development of the productive forces these relations turn into their fetters. Then begins an era of social revolution. The changes in the economic foundation lead sooner or later to the transformation of the whole immense superstructure [of politics, culture, etc.].²

This hypothesis is basically true, but it is expressed in a sloppy way that tends to support Marx's invalid statism. It is virtually meaningless to say, as he does, that a specific set of production relations starts to fetter the productive forces at some point in its history, thus finally triggering a revolution that sweeps away the old society—by means of a dictatorship of the proletariat, as Marx says elsewhere. For most or all of its history, the capitalist mode of production has both promoted *and* obstructed the development and socially efficient use of productive forces, by encouraging technological innovation but wasting resources in periodic economic crises, wars, socially useless advertising and marketing campaigns, an inequitable and irrational distribution of wealth, and so on. “Fettering” and “development” can therefore happen simultaneously, in different respects. In order to make any real sense of the notion of fettering, it has to be considered as *relative to* an alternative mode of production emerging within the bowels of the old society, a new set of production relations that is *more* productive and socially rational than the older set. Feudalism fettered, in a sense, the development of productive forces for eons, but it collapsed only when this fettering was *in relation to* a new, more dynamic mode of production, namely capitalism. Similarly, capitalism has in some ways obstructed the development of productive forces for a long time; it will collapse, however, only when it can no longer effectively compete with a more advanced, cooperative mode of production. Then, and only then, can a post-capitalist *political* revolution occur—i.e., after the (gradual) *social* revolution has already reached a fairly mature level.

In short, the approach of Via Campesina, the World Social Forum, and other such organizations to fighting capitalism—their decentralized, federated, grassroots, un-Leninist and un-Maoist approach—is right. Moreover, it is a truly Marxist approach, if Marxism is cleansed of its quasi-Leninist and un-Marxian elements.³ The notion of peasant activism as having a role to play in a transition from capitalism to socialism is not particularly un-Marxian, as long as it is understood that such activism has to work in tandem with

¹ [I.e., before any final “seizing of the state.”]

² Available at <http://www.marxists.org/archive/marx/works/1859/critique-pol-economy/preface.htm>.

³ [I now think I was too hard on so-called “Leninism” in this paper and my thesis. A revolutionary political party can have a positive role to play if it doesn't try to remake the economy from the top down, by bureaucratic fiat as it were. If Leninism entails something like “voluntarism”—attributing immense historical importance to human agency and the leadership principle at a putative “moment of revolution”—that aspect of it is wrong. And I don't like its authoritarian overtones. But it can be understood in more innocuous ways too.]

urban, industrial activism in order really to lead to a new society. It is simplistic, however, to equate peasant agriculture with all small-scale farming, as Walden Bello seems to. A Marxist does not have to be committed to the idea that small-scale farming is doomed or has no role to play in an advanced capitalist or socialist society. All he is committed to is that the explosive growth of capitalism tends, in the very long run, to undermine or destroy feudal class structures and subsistence agriculture. These may persist for long periods of time, and subsistence farming in particular may last in some regions for all of history. It does tend to become less widespread, though, as industrial capitalism conquers the globe—a fact that Bello does not deny. Whether various forms of small-scale agriculture might be essential to the functioning of even late capitalism or socialism is a separate question, to which a Marxist can coherently answer “Yes.”

Questions about Marxism aside, Bello is right that the way to a new society is represented by the economic and political activism of the downtrodden classes in all sectors of the economy, be they agriculture, industry, public education (under attack across the West), the service sector, or whatever. The Marxian injunction that “workers” all over the world unite should be understood as referring not only to the industrial proletariat but to the exploited and marginalized of all stripes, non-capitalists in whatever form. Whatever Marx’s original intention was, this is the proper understanding of the revolutionary path. If peasants, industrial workers, students, small farmers, the unemployed, environmental activists, victims of discrimination, and dispossessed indigenous peoples all join hands to carve a new economy and politics out of the collapsing ruins of the old, it is possible that humanity will live to see another era.

Indigenous protest movements have in recent decades become regular features of Latin America’s political landscape. In *Crude Chronicles: Indigenous Politics, Multinational Oil, and Neoliberalism in Ecuador* (2004), Suzana Sawyer provides a rich ethnography of such resistance in the Ecuadorian province of Pastaza during the 1990s. She focuses on the struggles of the Organization of Indigenous Peoples of Pastaza (OPIP) to defend ancestral lands and communities from the incursions of a neoliberal state in alliance with transnational oil corporations, particularly the Atlantic Richfield Company (ARCO). In addition to the state’s oil concessions that resulted in destructive outside interference in their social and natural environments, indigenous peoples had to contend with a 1994 revision to the country’s agrarian laws that endangered communal holdings and deepened monoculture production. Throughout her account, Sawyer does not stray from her main themes: first, that globalization is not “equalizing, democratizing, and homogenizing” but quite the opposite; second, that it constantly produces oppositional movements that themselves help to shape its trajectories; third, that corporate capital and the state use abstract discourses of liberalism, democracy, and equality to erase history and to neutralize and depoliticize social inequalities; and fourth, that neoliberalism does not entail a reaction against state intervention in society (as is often claimed) but rather a reconfiguration of such intervention so that the state can “relinquish many responsibilities for overseeing the welfare of its citizens” (pp. 16, 116). All these points are both provocative and, in the light of *Crude Chronicles*, surely true.

For the uninitiated reader, Sawyer places the Pastaza Indians’ struggles against oil companies and the neoliberal state in their historical context. Texaco exploited oil reserves in the northern provinces of Nabo and Sucumbia from the 1960s to the early 1990s, leaving behind a legacy of environmental destruction. Knowing that their own province would eventually be threatened by oil exploration, Pastaza Indians founded OPIP in 1978 to defend and gain legal title to their lands. This effort culminated in a 1992 march on Ecuador’s capital, Quito, which Sawyer is able to describe in detail because she participated in it. Its outcome was that the state granted the Indians communal land title to 55 percent of the territory they claimed, arbitrarily dividing it up into nineteen zones whose boundaries ultimately served to fragment indigenous authority and create new divisions among indigenous peoples. Sawyer gives a nuanced Foucauldian analysis of how this map effectively erased history and culture and fostered new power dynamics through which to “discipline” native resistance.

Less than two years later, in January 1994, Indians again marched to Quito, this time largely in response to recent changes to the Hydrocarbon Law that made the regulatory regime much more friendly to multinational corporations. Just a few months after this, the national government also passed the epochal, business-friendly revision to Ecuador’s agrarian laws mentioned above, which inflamed *indigenas* and

campesinos across the country. Thousands occupied transportation routes and set up roadblocks to protest the legislation; their nation-paralyzing action ended only after the president declared a state of emergency nine days later and dispatched the military to quell the protests.

Sawyer, who lived among Pastaza Indians for years and was a trusted companion of OPIP's leaders, relates all these events and many others in a decidedly "interested" way, making her book all the more engaging. Perhaps its most intriguing parts are the descriptions of meetings she attended between representatives of OPIP, ARCO, and the state; she is excellent at exposing the disingenuous tactics used by ARCO to counter OPIP's claims on behalf of native communities. For example, ARCO, which was given an oil concession in Pastaza in 1988, bribed (with school lunches, blankets, plane rides, etc.) a hundred or so natives who lived in the vicinity of its oil-drilling operations to support it against OPIP, which wanted to forge a united front of all *indigenas* against the company. ARCO then denied in meetings with OPIP that it was fomenting divisions between natives, arguing on the contrary that these divisions were merely "democracy at work" (p. 6). It pretended that DICIP—the artificially created group of a few dozen indigenous ARCO-supporters—had as much legitimacy as OPIP, an organization with a long history that represented many thousands of Indians. Sawyer therefore argues that ARCO used the language of democracy and liberalism to deny realities of history and culture.

The state is at least as much of a villain as ARCO in Sawyer's story. Not only does it enable the corporations that wreak havoc in Indians' lives; it uses the very tactics of these corporations to disingenuously claim it is being fair. That is, it uses "the purportedly neutral language of liberal law such that it reinscribe[s] difference and inequality" (p. 183). These tactics are on ample display in the two-week, televised commission that was formed to address Indian grievances against the new agrarian law. On one side (figuratively speaking) is the government and the landed oligarchy, with huge teams of legal advisors; on the other are Indians with a much smaller team of advisors, because many indigenous representatives are simply denied entrance. The government and oligarchy argue that everyone must respect laws equally, exceptions or special laws cannot be made for indigenous groups who want to preserve communal control of land; the *indigenas* argue that particularity, created by history, does exist, that social inequality has created an "uneven playing field" that demands recognition of historical specificities if justice is to be served (p. 194). Needless to say, the outcome of the commission is merely cosmetic change to the new agrarian law.

One of the reasons *Crude Chronicles* is such an enjoyable read is that it fuses analytical history with a compelling narrative. It is a story, told from the intimate perspective of someone who knows the central actors well, of an oppressed group fighting for its rights against sprawling institutions and faceless bureaucrats. Interweaving the narrative, though, is insightful analysis and a sophisticated understanding of the implications of neoliberalism. Sawyer is unquestionably partisan, but sometimes moral imperatives are so clear that partisanship is necessary. In short, *Crude Chronicles* is sure to be of both intellectual and human interest to specialists and non-specialists alike.

*

However talented filmmakers are, film itself is inherently an inferior art form—like photography, though for mostly different reasons. Adorno remarked that "Every visit to the cinema, despite the utmost watchfulness, leaves me dumber and worse than before." In part that was directed against the shallowness of "sociability," but it applies to film itself too. In a word, the problem is that when one sits in the dark watching images and sounds flit by, one is forced to be relatively passive. And there is something "instantly gratifying" in a vulgar way about fleeting sounds and images. Even the best movies are....*unreal*, separated from the viewer—a flat screen of *stuff happening* as you sit there looking at it. There is something more interactive and more *real* about theater than film. Also, film is by necessity more *atomizing* than other art forms. People sitting in the dark, each in his own world, looking at electronic images and having noise blared at them, no performers present, no watching the art *enacted right in front of one*, an inorganicness....a "splicing together," an artificiality about the situation and the art itself. And then the experience is over and you rub your eyes and try to become active and whole again. It's different from watching plays.

*

A New Year's resolution.— The child is father of the man, and the child is still in me. The enthusiasm and hope are still in me. Youth! Desiring change, turning my back on the past, having lived a thousand years but feeling newborn as the days get longer and First Night is here. Christmas presents, shiny new things, books and CDs and clothes, the tuned piano in the living room beckoning me when I walk past, Chicago with its gaiety beckoning me. New shiny clothes to show off, new people to meet. The clothes really do make the man. I'm going to start dressing well, not being as lackadaisical about my appearance as I've always been. Generally I look decent but not particularly classy. I just wear whatever. And that must have a subtle effect on my state of mind. I have good clothes; I'll wear them more often and buy more, and I'll start socializing again after the Zhilan-induced vacation from that. [...] It's an easy resolution to maintain, and an intrinsically satisfying one. Looking good, feeling good, feeling young and healthy, reveling—it's wonderful.

*

Above I compared 2011 to 1968. But in fact the former has been more revolutionary than the latter. 2011 is just the beginning of something very big; 1968 was, in many ways, basically the end. 2011 was a manifestation primarily of *elemental economic grievances*, even in the Arab world; 1968 was a manifestation largely of the youth's cultural discontent, European universities' dysfunctionality, anti-war sentiment, and, yes, young workers' dissatisfaction with conditions of production. 2011 targeted society's central power-structures, namely big business, especially financial institutions (and, outside the West, political dictators); 1968 was directed against...authority in general. Its diffuseness indicated its political immaturity. The main point is that 2011 was a symptom of a world order's descent into long-term crisis, whereas 1968 was produced by a variety of less systemically portentous developments. 2011 was the beginning of the real revolutionary period (a hundred years long?)¹ of capitalism's decline.

*

Philosophical thinking.— According to the Great Philosopher John Rawls, "...the causes of the wealth of a people and the forms it takes lie in their political culture and in the religious, philosophical, and moral traditions that support the basic structure of their political and social institutions, as well as in the industriousness and cooperative talents of its members, all supported by their political virtues." Jesus Christ. Really? Why do academics always insist on flaunting their naïveté? And why do they have to do it in such a ponderous, easy-to-mock way? Explaining the nature and causes of a people's wealth by...their religious, philosophical, and moral traditions, and their political virtues (all of which *underlie* their political and social institutions). Brilliant. Modes of production and distribution are irrelevant to the accumulation of wealth. —No one is more predictable than an academic.

*

Some modern crises of political legitimacy: Western Europe in the mid-seventeenth century; France in the late eighteenth century; Europe in the 1840s; the West and parts of Asia in the 1930s; much of the West in the late 1960s (though to a more limited extent than in previous crises); and North America, Europe, Russia, and the Arab world now. All these periods have been transitions. None has been more important than the one we're embarking on.

*

¹ [Are you kidding? It'll be much longer than that!]

Life is not totally “meaningless.” People’s commitment to their work, to relationships, and to life itself proves that. However, it is hard to deny that life is not as meaningful as we’d like. It is the evolutionary product of “meaningless” random variation and natural selection, not meaningful teleology or some kind of cosmic purpose. The course of an individual’s life is molded to a great extent by accidents; his very existence is an utterly improbable accident. No one is as special or valuable as he thinks he is. Whether he is popular or unpopular does not mean what he tends to think it does, that he is (respectively) valuable or not valuable. There is little justice in the world. A person’s basic existential project of objectively confirming his self-love—which is ultimately what the desire for “meaning” is all about—is unrealizable. He implicitly wants to be remembered by the world forever, or at least for a very long time, because he thinks that that kind of recognition would make his life more consequential, but he will not be. And even if he were it would not matter, because he’d be dead. His life is organized around illusions, such as that of the durable, permanent substantial self, and of the special value of loved ones, and of the “necessity” of his own existence. His place in the universe is not what he likes to think it is. In the long run and on a broad scale, his achievements are inconsequential. All this is not *meaninglessness*, but it is *insufficient meaningfulness*.

[Another way of saying it is that in wanting life to be “meaningful,” people want the world to have value “in itself.” Their desire for some kind of recognition from the world (i.e., for self-confirmation)—which is inseparable from their desire to have a meaningful life—is also inseparable from their implicit belief that the world has value. (We want recognition only from things or people to which/whom we attribute value.) But it doesn’t. Nothing has value in itself; its value comes from the subject, in other words from us.¹ The world and life itself have *no* “intrinsic value,” whatever that means, which is to say they are essentially meaningless. Thus, the human project, viz. the urge for self-confirmation, is, from at least one perspective (in fact several), fundamentally deluded. It presupposes that there is some *value* in “confirming” oneself, in objectifying one’s self-love, in making it a part of reality (so to speak), which itself presupposes that reality or the world has some sort of “objective value,” which it doesn’t. In any case, the notion of objectifying one’s self-love² is nonsensical, because *freedom* and *value* are necessarily *subjective* things.³]

*

My repetition-compulsion.— Despite the conventional wisdom, Max Weber was susceptible to materialism. For example, he thought that “rational economic practices emerged in Europe precisely within the context of an epistemologically antirational religious tradition” (*The Myth of Continents*, pp. 83, 84). Rational intellectual traditions therefore followed in the wake of economic developments. It could not have been otherwise, in fact, since people and institutions (practices) with the most resources will tend to propagate throughout society their way of doing things. Economic practices, of course, have always been supported by the most resources (since they pertain directly to the accumulation of wealth), and so are effectively the foundation of society. How is it possible this can still be doubted?

¹ I should clarify that we ourselves don’t *have* value (whatever that would mean); we *give* things value. [On an unrelated topic: morality is based on the assumption that humans have value, which, from a strictly rational point of view, they don’t and can’t. Morality itself, therefore, is not “true” somehow but just a human invention, an “imaginary” thing, as I’ve said before. It’s definitely a *good* thing (for us), though, and we should heed it despite its imaginary nature.]

² Which, to quote myself, “is ultimately what the desire for ‘meaning’ is all about.”

³ More exactly, from *one* perspective it’s nonsensical to “objectify” or “confirm” your self-love. From another perspective, though, it isn’t; we do it constantly. We project our self-love into, and through, our activities and interactions with others, thereby in some sense actualizing it or objectifying it. But the goal of putting your self-love into the world so that it stays there, so to speak, i.e. so that the world from then on reflects to everyone “Chris’s value!” or something like that—something that can be *read into* the world—is nonsensical, though we all desire it (implicitly). What we desire, in other words, is to overcome the boundaries between self and world, self and other. That’s what it all boils down to, the desire for meaning and everything else. But it’s impossible, indeed meaningless.

*

I've always suspected that people give too much credit to ancient Greeks. They couldn't have been as divinely original as we're taught. Lynda Schaffer's article "Southernization" (1994) and Martin Bernal's famous book *Black Athena: The Afroasiatic Roots of Classical Civilization* (of which I'm reading only a few dozen pages) validate my suspicions. Their broader points—perhaps watered down a bit—are fairly obvious, though. Greece was hugely influenced by the Semitic, Indian, and Egyptian peoples, and by the Near East in general. This was acknowledged by the Greeks themselves, who actually thought their culture was the result of colonization by Egyptians and Phoenicians around 1500 B.C. But let's admit that the Greeks were indeed original in some respects; they're not the only ones. Far from it. Think of the Sumerians, the Indus Valley civilization, the ancient Egyptians, the so-called Semitic peoples, the Chinese, the Indians, the Romans in a few ways, the medieval Arabs somewhat, later Europeans, and Americans. And those are only the most obvious examples. Anyway, it's silly; all societies are original in their own way, though admittedly some make greater contributions than others (due largely to their integration in extensive economic networks, borrowing from other peoples, etc.). As for Europeans proudly seeing the Greeks as their ancestors, that is at best a half-truth. Even the Romans are not direct ancestors—or, insofar as they are, it is by the mediation of an un-Roman (and un-Hellenic) institution, the Church. [In fact, Christianity itself comes from the Near East!] In any case, Europeans who say that their civilization derives from the Greeks are also saying it derives from the Phoenicians, the Egyptians, Indians, the Orient in general. That happens to be true, by the way. Barbaric Europe had to be "southernized" and "easternized" (to an extent) before it could "westernize" the rest of the world. See Schaffer's article, and common sense.

*

A long time ago I quoted an author on the Hellenistic origins of Christianity, how it was just one of many mystery religions proliferating in the time of Christ. Jerry Bentley, in *Old World Encounters*, adds some tidbits on how the Judaic tradition was influenced by Zoroastrianism. "Zoroastrian doctrine promised personal salvation and eternal life to individuals who observed the commandments to think good thoughts, speak good words, and perform good acts." "Zoroastrianism was more a national or ethnic faith than a missionary religion. Even without benefit of active proselytization, though, Zoroastrian beliefs and values exercised a remarkably wide influence. Post-exilic Jews adopted and adapted many elements of Zoroastrian belief—including notions that a savior would arrive and aid mortal humans in their struggle against evil; that individual souls would survive death, experience resurrection, and face judgment and assignment to heaven or hell; and that the end of time would bring a monumental struggle between the supreme creator god and the forces of evil, culminating in the establishment of the kingdom of god on earth and the entry of the righteous into paradise. Many of these elements appear clearly in the Book of Daniel, composed about the middle of the second century B.C.E., and they all influenced the thought of the Jewish Pharisees. Indeed, in its original usage, the term *Pharisee* very likely meant 'Persian'—that is, a Jew of the sect most open to Persian influence. It goes without saying that early Christians also reflected the influence of these same Zoroastrian beliefs. Some scholars hold that Zoroastrian appeal extended even into India, where the notion of personal salvation would have influenced the early development of the Mahayana school of Buddhism." Fascinating! Zoroastrianism lives on through Judaism, Mahayana Buddhism, Christianity, and Islam! The "Judeo-Christian tradition" is really, in some respects, the "Zoroastrian-Judeo-Christian tradition." The "West" derives largely from the "East"—although lately the East has been remade by its contact with the West.

*

On Edward Said.— The gist of *Orientalism* is surely true. It's almost a truism, in fact, and has therefore been treated as revolutionary or highly controversial by postmodern intellectuals. (The book's

emphasis on high-cultural "discourses" also marks it as important in the eyes of intellectuals, who traffic in discourses.) Writers, artists, and policymakers in "the West," from ancient Greece to the twentieth century,¹ have tended to "essentialize" Arab and Islamic societies, oversimplify them, caricature them, present them as a feminized and inferior "Other." That has been one way in which Western elites, especially in modern times, have defined themselves (as exemplars of the West, the dynamic and active West) and have justified their economic and cultural imperialism. This should have been obvious to any thinking person by the 1970s—and therefore probably *wasn't* to most intellectuals, until Said came along. It is also true, however, that every major society in history has exhibited tendencies to essentialize, oversimplify, caricature, etc. other societies, just as individuals are often guilty of self-overestimating oversimplifications in their judgments of other people. It is a pronounced tendency of the human mind, this urge to simplify and to reduce the other to particular, often *negative* qualities instead of appreciating the human ambiguity and multiplicity of his or her character.

On the other hand, some abstractions and generalizations are grounded in fact, are objectively justifiable. Individuals and societies do exhibit tendencies—such as the one I just mentioned—and it's justifiable to characterize them on the basis of such patterns. It is also necessary, given that we have to *talk*, and that talking necessitates abstracting. Nietzsche and thinkers before him—probably all the way back to antiquity—already argued that language "lies" in this way, although to characterize it as lying is misleading. Postmodernism is certainly not original in its obscure recognition of this truth. Whether Arab and Islamic societies have exhibited some of the patterns that Orientalizing writers ascribe to them is another question, to which the answer in many cases (though not all) is probably no.

To return to Said: while I admire his devotion to the Palestinian cause, I'm not impressed by his thought. His rejection of Marxism, his (partial) adherence to postmodernism, his ambivalence toward the Enlightenment.... It's all confused and silly. From the criticisms I've read, *Orientalism* itself was ironically simplistic and essentializing (of the so-called West). While he made a few good theoretical points and had suggestive intuitions, Said just wasn't a rigorous thinker.²

*

It's funny that people often deprecate Marxian materialism as an explanation of society and human behavior, given that virtually no one cares much about ideas. People *think* they do, but basically they're wrong. They insist that ideas, ideological motivations, and spiritual matters are very important to people....but then proceed to ignore them in their lives. Just listen to humans talk and you'll see they're essentially unfamiliar with ideas and don't think about them very often. Their understanding of the world is utterly superficial; their ideological commitments exist mainly on the level of *words*; quotidian personal interests are what preoccupy them. Food, money, success, power, relationships, entertainment, etc. Every so often religion or politics will come up in conversation and people will get strangely animated for a few minutes, but that isn't very significant. Anyway, most of the time a person's commitments to certain ideas, such as they are, derive from their reflection of his interests, or their being a sublimation of his interests. *Some* selflessness might be involved—and with many people that's a very important element—but even then, of course, the ideas are merely abstract reifications and "universalizations" of concrete interests or feelings or modes of interaction with others. But I've strayed from my original point.

I'd also note, incidentally, that often when people object to "ideas" they're really objecting to changing their way of *doing* things. Religious conservatives oppose reformers in large part because they're used to doing things (rituals) a certain way, and the thought of changing that makes them profoundly uncomfortable. The human mind/brain, after all, like that of other animals, is a pretty "conservative" thing: it finds comfort, so to speak, in patterns, habits, routines, rituals repeated again and again, such that encountering or doing new things can be very disturbing. Not always, especially not in the case of children (although observe how they react upon meeting strangers or when their parents force them, for whatever

¹ But probably less so between the end of the Roman Empire and the Renaissance.

² See, for example, Aijaz Ahmad's *In Theory: Classes, Nations, Literatures* (1992).

reason, to change some habit or discard some toy they're used to). Curiosity and *learning* can be a source of great pleasure. But changing one's behavior or attitudes is hard, sometimes impossible. Sartre notwithstanding, the self is not "free" in this way.

*

The evolution of European political absolutism, not surprisingly, was ironic. Initially it was useful to the rising bourgeoisie, as the latter was useful to it, in both the bourgeoisie's and the monarchy's struggle against the feudal aristocracy. The monarch could act in the interest of merchants and other capitalists in order to increase his tax base and wealth (through trade and budding industry), as well as to diminish the power of feudal interests relative to his own and that of a class (or classes) opposed to feudalism. In fact, you could probably say that absolutism depended on large-scale mercantile activities and the latter (on a large scale) depended on absolutism, or at least on a powerful sovereign. But then capitalists—of various kinds, including commercial, financial, and industrial—accumulated more and more wealth and became more central to the social order, and they wanted more political power, and their demands started to threaten absolutism. The population meanwhile was getting restless for reasons related to the rise of capitalism (commercial and proto-industrial) and the state's sponsorship of it. In the end, the absolutist state turned back towards the aristocracy as an ally in its struggles against the people and the bourgeoisie (and its "representatives," such as most intellectuals), but it was too late. Absolutism was doomed, and it collapsed. The bourgeoisie was ultimately the progressive force; absolutism was progressive only in relation to the feudal aristocracy, not to the bourgeoisie.

All this relates to the *logic* of the history, not necessarily to every act by all the major actors. I have to state that obvious caveat because postmodernists will inevitably try to "problematize" my summary, find counterexamples and use them to triumphantly declare me wrong. (The postmodern mind always tries to deny "general" truths.)

*

One of the innumerable examples of most "humanistic" academics' lack of intellectual seriousness is their readiness to cast the aspersion "Teleological!" at you if you suggest there might be some kind of reason in history. No one ever explains why even a soft variant of "teleology" is necessarily false. Actually, the charge doesn't have much content; it is basically a value-judgment. Postmodernists simply have a visceral aversion to statements like "Things were almost inevitably going to happen in such and such a way," maybe because that sort of statement seems to sneak in a notion of "progress" that supposedly justifies posterity's "enormous condescension" for historical losers, i.e. legitimizes the terrible fates of massive numbers of people all over the world and "naturalizes" Europe's rise, even makes it seem *morally* good. All this is nonsense, of course. It is as nonsensical as accusing someone who recognizes that biological facts make it highly, *highly* probable that any given society will valorize masculinity over femininity,¹ of claiming that masculinity *should* be valued more than femininity. "Is" doesn't imply "ought." Not every notion of historical "progress" has to understand progress in a *moral* sense. History is an absurd tragedy, and progress, i.e. history's movement, is in itself neither good nor bad. Or rather, it is both good and bad. Any moderately perceptive analyst of history will recognize that sometimes the future *is* "present," so to speak, in its past, in the sense that it is made inevitable or nearly inevitable by it. (See the last chapter of my M.A. thesis.) Actually, maybe that Hegelian claim—that the future is somehow implicit in the past and reveals its "truth" or "meaning" (for the past can be fully understood only in the light of the future)—doesn't presuppose inevitability.... I'm getting confused.... It's very difficult to parse the idea that

¹ Even in matriarchal and matrilineal societies, people effectively *treat* women (in daily life) as more "weak" than men. Ideologically women may be objects of reverence or some such thing....but that still makes them the second sex, the "other." And Maurice Godelier remarks that "in the last analysis" it is likely that men have always "occupied the summit of the power hierarchy."

historical processes have a logic, but they unquestionably do, as retrospective analyses show. (What sort of logic? How deterministic is the logic? On what level of historical “abstraction” or “generality” does the logic operate? What is the relation between the logic and the contingencies of daily events? Etc.)

By the way, the postmodernist’s determination to see veiled value-judgments in claims that are strictly factual, and in particular to see attacks on himself or some group of people with which he identifies or sympathizes, is indicative of a somewhat totalitarian mindset. To quote Chomsky (from a different context): “The sign of a truly totalitarian culture is that important truths simply lack cognitive meaning and are interpretable only at the level of ‘Fuck You,’ so they can then elicit a perfectly predictable torrent of abuse in response.” The totalitarianism of radical postmodernists is beautifully ironic, and beautifully predictable. —But these people, after all, are a product of their culture, their paranoid, hypersensitive, suspicious, atomized culture.

*

One of the things that sets Chomsky apart is the degree to which he is not a decadent. He seems to float above his culture, as it were. Or, better: he is a rock. I’m much more of a decadent than he, though less so than most people.¹

*

Marxism applied to South American “Indian” society.— On pre-Columbian social relations in the Andes, Steve Stern says, “Reciprocity among a community of producer-relatives constituted the central institution or relationship governing the production of material life in local society.” He goes on to say this: “A society’s fundamental relations of production tend to generate a particular kind of ethos, world view, and set of values. In Andean society, the mutual obligations of reciprocally related ‘brothers’ of the community pervaded local values and lifeways. As we have seen, Andean notions of justice or vengeance were closely related to a concept of ‘balanced’ exchange among those paired together for a purpose, whatever the latent conflicts between them. Andean peoples understood and judged their relationships with themselves, their chiefs, and their ancestor-gods in these terms. Andean ideas of morality and wrongdoing expressed judgments about the quality of reciprocal relationships of mutual obligation, rather than adherence to abstract rules of behavior.”

*

An exchange with Chomsky.— Though I’m ashamed to admit it, I haven’t read many of the philosophical texts from the 17th and 18th centuries. I don’t know how that’s possible, but it’s true. I’m appallingly ignorant. When I have time, I’ll remedy that. Meanwhile, I sent Chomsky an email a few days ago:

Professor Chomsky,

I heard you say in a talk recently that empiricists such as Locke and Hume accepted the existence in human minds of "internal structures" (or something along those lines); they didn't think that *everything* comes from sensory experience. No doubt you're right. I'm just curious, then, how you would define classical empiricism. [...]

¹ In my defense, someone raised in leftist cultural milieux of the 1930s and '40s was much less likely to evince “decadent” traits [i.e., cultural pollution] than someone raised in the postmodern culture of recent decades. Look at David Foster Wallace, for example, who was almost a *complete* decadent.

Would you say that this paragraph from the *Stanford Encyclopedia of Philosophy's* entry on the subject is a bit simplistic?—"The dispute between rationalism and empiricism concerns the extent to which we are dependent upon sense experience in our effort to gain knowledge. Rationalists claim that there are significant ways in which our concepts and knowledge are gained independently of sense experience. Empiricists claim that sense experience is the ultimate source of all our concepts and knowledge."

Thanks!

Don't know what you're quoting. I've written about the topic often. There's no doubt that Locke and Hume assumed internal structure to the mind – they were not lunatics, which is the only alternative. In Hume it's quite explicit. A core part of his philosophical psychology is that a good part of our knowledge comes to us "from the original hand of nature" – what we'd nowadays call "genetic endowment." In practice Locke made quite rich assumptions of this kind, e.g., in his careful analysis of the notion *person*, relying on notions of unity of consciousness and the like, which obviously don't derive from sensory experience. As Leibniz pointed out at once, Locke's *reflection* opened the door to rich innate structure.

It's difficult to distinguish empiricism from rationalism, because they overlapped so much. Take, say, Locke's famous refutation of innate ideas. It's OK in itself, but it doesn't even address the Cartesian notion of innate ideas (basically dispositional, like susceptibility to disease). And of course rationalists assumed reliance on sensory experience. That's why Descartes broke with custom and dissected sheep, etc. I think they should be regarded as different tendencies in the history of thought. In print, I've suggested abstracting leading ideas that contrast and calling them R and E, so as not to make factually false claims about a complex tradition.

I don't think the definition you cite is consistent with the texts, but it can be taken as a kind of idealization, of the R-E sort. Maybe useful, as long as what it is is recognized.

*

With regard to the period between the 1530s and 1640s, Steve Stern divides the economic system that prevailed in the area around the city of Huamanga in Peru—and, by extension, the system in much of Spanish Latin America—into three stages. The first, lasting until the 1570s, was dominated by *encomenderos* and priests who pioneered relationships with local Andean societies. (An *encomendero* was a "Spanish colonizer in whose charge the Crown 'entrusted' Indians, from whom the *encomendero* could collect tribute and labor services in exchange, presumably, for tending to the natives' spiritual and material welfare." This system of *encomiendas*—a term that denotes the grant of Indians to an *encomendero*—was, as you see, quasi-feudal.) "Colonials [i.e., the Europeans] depended greatly upon uneasy alliances with ethnic societies and their chiefs to secure the labor and goods they needed: labor for construction, transport, mines, textile manufactures, artisanry, agriculture, and ranching, and goods ranging from precious metals to basic foodstuffs to an enormous variety of handicrafts." In the 1560s this system started to break down under Indian resistance to Europeans' demands for larger and more stable supplies of labor to work newly discovered mines. Also, radical Indian politico-religious movements threatened Spanish power. The colonial state was too weak to do much about these problems until the viceroy Toledo stepped in in the 1570s and reorganized the whole economic, political, and social system. He made the state much stronger, in fact instituted a "state form of extraction" defined by tributes and the *mita*, a "colonial forced-labor draft institution providing rotations of native laborers to selected beneficiaries of the state." "The *mitas*,

especially, made it possible to mine and refine large quantities of mercury and silver, to manufacture textiles in *obrajes* [i.e., workshops] employing the labors of a hundred or more Indians each, and to advance commercial agriculture and ranching.” Again, though, Indian resistance—and population decline—eventually caused major problems. “Huamanga’s native peoples adapted to the rise of state-sponsored extraction by engaging in aggressive, persistent, often shrewd use of Spanish juridical institutions to lower legal quotas [for tributes and mitas], delay delivery of specific *corvées* and tributes, disrupt production, and the like. Threatened with instability, legal entanglements, and a growing squeeze on their labor supply, elites had to resort to alternatives that might shield them from judicial politics, and assure more direct control over a clientele of laborers and dependents.”

By 1630 or 1640, therefore, *private* forms of exploitation had grown more important. “*Yanaconaje* [i.e., “an institution of long-term personal bondage attaching [retainers or serfs] to masters”] and other forms of peonage, wage labor and work contracts, extralegal tributes and *corvées* arranged through [Spanish magistrates] or other functionaries—these, along with African slavery, represented the dynamic, growing forces of the early seventeenth century.” All three of these forms of economic exploitation, even the “private” form (except when it involved wage-labor), bore distinct resemblances to feudalism and/or slavery.

“The labor system which matured in early seventeenth-century Huamanga thus differed sharply from the one with which the colonials began. Exploitation had evolved in three distinct stages, and in each case the transition from one phase to the next bore witness to the impact of native resistance on colonial policies and strategies. In the 1560s, Indian activity led to a crisis of the colonial system as a whole.... In the 1570s a powerful reformist state rescued the colonials and launched a new era of political control and economic prosperity. A half-century later, Indian resistance no longer threatened European hegemony or the social and economic structure as a whole. But conflict had continued, and native activity created a labor problem which, again, forced elites to modify social and economic strategies. Shortages, bottlenecks, and disruptions affecting specific enterprises, rather than a generalized crisis of colonial rule and extraction, rendered official Toledan institutions obsolete, and spurred a further evolution in Huamanga’s history of labor.”

Brilliant Marxism.

....Incidentally, the conventional narrative that Spaniards came in, destroyed Indian society wholesale, and built their own colonial structures on top of the ruins is simplistic. Traditional kinship structures and forms of social organization persisted for a long time; the colonials used them to organize the extraction of surplus labor. By the late sixteenth century, incipient class contradictions in Indian society—between chiefs and their kinfolk, for example, and between a small Indian elite and the peasant majority—were growing, such that some natives were in a “contradictory class location,” sharing certain interests with the colonial system that gave them a degree of power and wealth and other interests with their peasant kinfolk who were harshly exploited. But it took a very long time for colonial expropriations and the burgeoning commercial economy to so undermine the self-sufficiency of local Indian societies that traditional structures disintegrated. (By the early seventeenth century their slow disintegration was very visible but by no means remotely complete.)

*

Janet Abu-Lughod is probably right that industrial capitalism would not have arisen in Europe, certainly not when it did, had not the “discovery” of the Americas facilitated primitive capital accumulation and, later, the production of raw cotton to be worked up by English laborers. In general, exogenous factors obviously contributed to Europe’s rise. On the other hand, I find it hard to believe that if the Chinese, Indians, or Arabs had discovered the Americas between, say, the thirteenth and eighteenth centuries, industrial capitalism would have subsequently (within a few centuries) spread over their lands. For one thing, these peoples were not as savage as Europeans. Given the nature of their societies, it is unlikely that they would have barbarously slaughtered, plundered, and exploited Amerindians for the sake of extracting surplus, or transferred millions of Africans to the Americas and put them to work on plantations and in

mines. In the early modern period, Europe was a savage place continually at war with itself. Why? Largely because of its political fragmentation and parcelized sovereignty—together with the attempts of emerging states to triumph over this political fragmentation and parcelized sovereignty, to subordinate foreign and local powers to themselves. To do that, among other things they had to protect and encourage manufacturing and trading in cities and abroad, since this ultimately increased their own wealth and power. The accumulation of surplus (and use of it to increase power in a very competitive environment) was a driving, overriding political and economic imperative; unprecedented institutionalized brutality—soon enacted all over the world—was the means by which to carry it out.

In other words, the emergence of the nation-state [which wasn't fully accomplished even in Western Europe until the beginning of the twentieth century] was an essential cause of the rise of Europe (even before the Industrial Revolution, and to an extent even before the Americas had really started to show their potential). No such entity was emerging elsewhere, or at least not a cluster of such entities in a relatively small continental area that impelled them all to fight savagely for their survival and power. Like most old insights, this insight is still profound.

—I might almost say it would have been hard for the capitalist mode of production to become the dominant mode *anywhere* in the absence of political competition approximately analogous to that that existed in medieval and early modern Europe. Otherwise states and other powerful entities (e.g. feudal landowners and warlords) would have had little incentive, at least no *pressing* incentive, to not only tolerate but encourage the rise of relatively autonomous cities and manufacturing/trading/artisanal classes that could in the future potentially threaten the power of the entities that had initially supported them. This, of course, is what finally happened in Europe—proving that the Chinese state was, in a sense, wise never to have let urban areas and proto-capitalist classes gain substantial autonomy and accumulate enormous power vis-à-vis the state. In Europe, the bourgeoisie and its intellectual hangers-on (descendants of earlier burghers, etc.) had by the eighteenth and nineteenth centuries—even earlier, in some places—so gained the advantage over the *ancien régime* that they could, in conjunction with popular social movements, undermine and eventually topple the old order to remake society in ways more congenial to unfettered capital accumulation and bourgeois political power. See my M.A. thesis for more speculations along these lines.

*

Read this, please.—It's unpleasant to know that a lot of people who read this journal will consider me a misogynist. *Me*, the guy who loves women like John Keats did! In truth, *context* is what matters. If I made all these observations about women in “appropriate” contexts, even most feminists wouldn't find me particularly offensive. For example, if you and I were observing women, especially young women, talking to each other or to men and I pointed out the significance of their mannerisms, modes of speaking, body language, etc.—i.e., if I invoked all those old stereotypes about women that, if qualified, contain a lot of truth—you would almost certainly “understand” my opinions or even agree with me. If you were an “educated” woman you might get a little defensive, but after I disarmed your defenses by insisting, truthfully, that I'm not “judging” women, that in many ways the stereotypes indirectly indicate *strengths*, that there's nothing wrong with acting “naturally” as long as it doesn't hurt other people, you would, I think, eventually concede my points. (Maybe you'd plead “Social constructions!”, and to an extent you'd be right, but not entirely. Humans aren't *tabula rasas*.) Incidentally, I could play the same game with men—in which case I *would* be implicitly expressing mild contempt for them, justifiably or not. But *written down*, my opinions come across as offensive and untrue. Because all you see is the *words* and not the “dynamic reality” that animates them.

By the way, Chomsky argues in “The View Beyond: Prospects for the Study of Mind” that there is no legitimate scientific reason to be interested in differences between people arising out of their different races or sexes. Suppose it turns out, he says, that “a person of a particular race, on the average, is likely to have a slightly higher IQ than a person of another race. Notice first [he continues] that such a conclusion would have null scientific interest. It is of no interest to discover a correlation between two traits selected at random, and if someone happens to be interested in this odd and pointless question, it would make far

more sense to study properties that are much more clearly defined, say, length of fingernails and eye color. But here, it is clear that the discovery is of interest only to people who believe that each individual must be treated not as what he or she is but rather as an example of a certain category (racial, sexual, or whatever). To anyone not afflicted with these disorders, it is of zero interest whether the average value of IQ for some category of persons is such-and-such....” He is perfectly right with regard to race. Even if there are slight differences (say, in athletic ability) between “average” people of different races, that is of essentially no interest. Race shouldn’t even really *register* with you in your daily life. It does, unfortunately, with everyone, including Chomsky, but the less it does, the better. In any case, history has shown it to be such a dangerous area that science should stay far away from it. *Sex* is another matter, though. No one treats women and men exactly the same, as Chomsky implicitly demands in his argument; everyone is “afflicted with the disorder” of caring about sexual difference. In fact, it would be terrible and immoral *not* to treat women and men somewhat differently. If a man acted around women the way he acted around men—if that were *possible!*—he would probably end up hurting their feelings or making them hate him. Men have to be careful how they act around women, in order to be respectful. Moreover, sexual differences are so much more substantial and evolutionarily meaningful than racial differences that they *are* scientifically interesting—which is why so many scientists study them. Are they all “sexists”? Well, yes, insofar as everyone is.

Chomsky’s complete lack of decadence, the fact that he is an absolutely consistent classical liberal, helps account for whatever intellectual shallowness he exhibits. His liberal idealism is so extreme that he refuses to write or speak about the messiness of human psychology, the moral messiness and “illiberalism” of nature. A little decadence can lead to greater understanding.

*

The proper way to think about Republicans and Democrats is as follows. The Republican party is just a *slave* to conservative sectors of big business. As Chomsky says, it isn’t any longer even a true party, a coalition of diverse interests; it is just a tool of the very wealthy (who are often religious conservatives—which is the “other” set of interests the party is commonly thought of as representing). The Democratic party is not quite a slave to big business; it is more like a serf, who on the day or two when he doesn’t have to slave for the lord can do some work on behalf of the other interests he is supposed to represent, such as women, the poor, minorities, immigrants, workers, consumers, the youth, future generations (hence environmentalism and nuclear disarmament), the rule of law, and the cause of internationalism. Most of the time these other interests get short shrift, but every so often the serf will throw them a bone, like he would to a dog.

*

Part of an email I sent a girl: “Well, I’m not sure you’re thinking about it in the right way. I don’t think mankind has to rise above its “inherently selfish” desires. I don’t agree with that whole “human nature is selfish, greedy, etc.” argument. As Chomsky says, human nature is not any *one* thing like that; it “contains multitudes” (to quote Whitman). Human nature is such that people can be kind, compassionate, self-sacrificing, heroic, devoted to the common good—as *well as* selfish, greedy, and so on. There are all kinds of possibilities. Which possibilities are actualized depends, to a large degree, on the social context. In the context of capitalism, greed and selfishness are going to be rewarded because that’s how you get ahead. In other social contexts, compassion and devotion to the common good could be rewarded, and so people would act in less selfish ways than they do nowadays. The task isn’t for *individuals* to overcome their “inherently selfish” desires; it is for *social movements* to overturn the *institutional facilitators* of greed and selfishness. Your individualistic perspective is wrong. In order to defeat selfishness [at least to *some* extent], people first have to come together to destroy the economic institutions that reward selfishness. Such “coming together” isn’t a terribly hard thing to imagine; it happens all the time. In the Arab Spring, for example.”

*

What does it mean to say that some particular act is the *right* thing to do? Is there any determinate meaning to that statement? Yes, as I have implied before. What it has to mean is that such-and-such an act logically follows from certain values in conjunction with a description of the given situation. Implicit in the judgment—or rather in the act of expressing it to someone—is that you *should* hold such-and-such values, and that in fact you probably *do* hold those values. If I say to you, “The right thing to do would be to help that blind man cross the street,” I mean that given your and my values (which I’m also saying are *good* values), we are committed to helping him cross the street on pain of being inconsistent with ourselves. You, however, are perfectly free to deny that you share my values or that my values are good. There is nothing “irrational” or “false” about such a denial,¹ except insofar as it might conflict with some other value(s) you hold, in which case one could argue it is irrational. But no question of falsity, or lack of correspondence with reality, can arise in discussions of values, because there is no “reality” to which value-judgments could possibly refer [or could represent or “express”]. They are nothing but manifestations of subjectivity.

*

Sent Chomsky another email: “I’m curious what your thoughts are on the philosophical issue of causation. Have you ever written about it? Do you think (with Hume and Kant, I suppose) that reason is inadequate to fully understand it? Is it just one of those inexplicable mysteries, comparable in that respect to free will? -For instance, it would seem as though a cause would have to be either temporally prior to or coincident with its effect. But with regard to the latter possibility, one is inclined to ask, “How could something *cause* something else if they happen at the *same time—together*, so to speak?” And with regard to the former possibility, the question arises of what the time lapse is between the cause and effect. Even if it’s infinitesimal, though, the question can be posed: how could the cause give rise to an effect *after* the cause has ceased to function? Shouldn’t the effect be brought about while the cause is still functioning? But then we’re led back to the first question. In short, the whole issue is paradoxical.” He agreed that those were good questions but said he had nothing new or interesting to say about them.

It’s possible there is something sophisticated about the paradox, but I can’t quite put my finger on it. One thing that seems necessary is to distinguish between different kinds of causality.

*

In a book I’m reading, the author refers to the “classic sociological [phenomenon of] ‘labeling’ (the idea that as you call people criminals or deviants, they start to act that way).” In the past I’ve speculated on the psychological reasons for this interesting fact, and while I forget most of what I said, I’m sure it was unnecessarily abstruse. The real reasons aren’t hard to think of. If somebody praises you, likes you, respects you, you tend to want to act in such a way that he’ll keep liking and respecting you. Actually, two things are operative: you want to be *worthy* of his respect (to the extent that you value him), *and* you want him to keep respecting you. These desires are connected but not identical. What’s happening is that the person who respects you is instantiating, to a degree, the abstract other in your consciousness; in turn, the abstract other is, to that extent, consisting of an internalization of that person. In other words, you have (at least temporarily) taken that person into yourself, to the degree that you value him and his opinion of you; therefore, to that degree, his respect for you entails or equates to your respect for yourself. You want to keep respecting yourself in that way, so you want to continue to be *worthy of his* respect—for the sake of the “abstract other,” as it were. At the same time, of course, you want the *actual person* to keep respecting you. All these considerations, incidentally, help explain how it is that humans can be so easily socialized into new roles. They want people’s approval, etc.

¹ [Unless, of course, you’re lying about your values. But that’s a different kind of falsity than I meant.]

Now the opposite case: if somebody *disrespects* you, claims you're a criminal or a deviant, you're going to try to shut him out of your mind, i.e. devalue him yourself. You'll try not to care what he thinks of you. In which case you might very well ignore or flout his values. "Fuck him," you implicitly say to yourself. "If he thinks I'm contemptible, fuck him, I don't care. I'll do what I want." If "he" is in fact *society*, or rather society's mainstream institutions and spokespeople, then a predictable result will be that you flout society's values. Your need to be (or to pretend to be) contemptuous of someone or something that is contemptuous of you will quite possibly manifest itself that way.

That isn't the only factor, though. There is also the element of "suggestion." Sometimes people act in disreputable or undignified ways because that's the easiest way for them to get *some* kind of "approval" from others, some kind of attention. If people think you're a buffoon, for example, you might try to make them laugh by *intentionally* acting like a buffoon. That might be the only way you can get at least a degraded kind of approval from them. Besides, it is simply *easier* to fulfill people's low expectations of you. It is extraordinarily difficult to change who you are, even minimally; if you try to do so you'll almost certainly be terribly disappointed with yourself, thereby damaging your self-esteem even more. People probably implicitly know this, so they rarely even *try* to change (i.e. in order to "prove them wrong"). They accept low self-esteem by accepting their other-imposed identity, rather than pushing themselves into even *lower* self-esteem by trying to *change*—infinitely hard work! (in part because it requires that you *directly confront* your self-dissatisfaction)—and *failing*.

Also, the more you're criticized by "respectable" people, the more tempted you'll be to seek out a different social circle, a circle that accepts you. If it includes "unrespectable" people, well then you'll start to *really* become that way yourself. This factor is surely important in the case of many rebellious teenagers. Alternatively, you might try to escape from a world that disrespects you by turning to drugs and alcohol, so "confirming" the world's opinion of you.

Aside from these psychological considerations, there is the fact that a society that devalues a group of people usually forces them into the margins, into marginal (or disrespected) occupations or physical spaces, where they have little choice but to act in "deviant" ways.

*

As you know, I'm not a great fan of Foucault. I'll admit, though, that he can be useful as a symbol of certain intellectual tendencies, somewhat like Marx is. The latter was not totally original, but he is useful in having brought together a mass of important ideas, some of which were already in circulation before him. Foucault is like a pale version of that. His "image" draws attention to the modern state's regulation of the body, of sexuality, of discourses, of social deviants and their punishment. More generally, his image highlights the social construction of various features of life,¹ and the pervasion of power-relations throughout society. To an extent, all these ideas are truistic; moreover, they predate him. And his expositions of them are confused, obscure, and sloppy. Nonetheless, sure, it can be useful to associate them with a single thinker.

[In a sense, Foucault was lucky: his preoccupations coincided with those of emerging social movements in the 1960s and 1970s. The sexual revolution, feminism, gay rights, interest in prisons and prison reform, etc. More accurately, he was astute enough to see that materialist politics was on the wane and that a writer who wanted recognition should embrace "post-Marxism."]

*

¹ Let's not forget to take this postmodernist logic to its self-defeating conclusion: the image of Foucault as enormously important, as very original, etc., is itself a social construction, in fact a myth. The academic discourse about him is indeed a much purer example of the tainted social construction of knowledge than contemporary science is! Beautiful, magnificent irony.

Irony no. 479,853.— The U.S.’s drug war, which really began in the Progressive era, used to be directed against drugs. The suppression of the drug trade was the goal. Its dramatic intensification in the 1970s and 1980s coincided with its catastrophic failure, which coincided with its unqualified success as determined by a new set of standards. Aside from being an excellent way for the powerful, especially conservatives, to frighten the public, increase their authoritarian control over society, and get more votes—which it had always been, to some extent—the drug war became a wonderful excuse to do two things: throw economically redundant people, potential troublemakers, into prison, which then allowed corporations to profit off their cheapened labor; and intervene in the affairs of Latin American countries so as to suppress rebellious political movements. This latter function also had the benefit of giving the government revenue, through arms-sales. While the prison-industrial complex is a horrific failure from the moral and social points of view, it is such a magnificent success from *power’s* point of view that it will continue growing for the foreseeable future.

*

The parallels between the English Revolution that began in 1640 and the French Revolution are striking. The two most obvious are the decapitation of the king and the declaration of a republic. But if you delve into the two events you’ll see many more parallels.¹ That isn’t surprising, after all, since the fifty years between 1640 and 1689 did for England largely what the sixty years between 1789 and 1848 did for France.² (Another obvious parallel is the Restoration of the monarchy in both countries. And, before that, the accession to power of a dictatorial military genius.)

*

Here is a one-sentence summary of the origins, trajectory, and outcome of the American Revolution: it “ended in reaction as the Founding Fathers used race, nation, and citizenship to discipline, divide, and exclude the very sailors and slaves who had initiated and propelled the revolutionary movement.” In general, that’s how revolutions go.

*

February

Reading *From Descartes to Wittgenstein: A Short History of Modern Philosophy* (1981), by Roger Scruton. Early in the book he observes that William of Ockham subscribed to “the doctrine of empiricism, according to which reason, far from being the sole authority in determining how things are [as Plato had argued], is subordinate to and dependent upon the senses (upon empirical enquiry).” I guess that’s a reasonable first approximation of a definition. “Such empiricism was by no means unusual in medieval thought; it is foreshadowed in Aristotle, and to some extent approved by Aquinas, who lent support to the scholastic tag ‘*nihil in intellectus quod nisi prius in sensu*’ (‘there is nothing in the understanding that is not first in the senses’)....” Not surprisingly, a lot of later doctrines in Hume, Leibniz, and others were anticipated by Ockham and his fellow scholastics. —Eternal return (sort of).

....“Empiricism only began to come of age as a philosophy when it was able to align itself with a comprehensive theory of language [which Hobbes was more or less the first to attempt]. It was then, when

¹ For example, in England, “Cromwell and his propertied allies had to rely upon the radical voices of...the Levellers and the Diggers, the soldiers and sailors, the urban rioters and rural commoners, [who] proved to have an agenda of their own.” These groups were comparable to the *sans-culottes* in France. In both countries, these radicals were eventually suppressed.

² Obviously the parallel isn’t perfect. In some ways the French revolutionary era should be extended to the 1870s.

it felt able to determine what can and what cannot be *said*, that empiricism was able to challenge rationalism in what proved to be its weakest spot. Rationalism must assume that men possess ideas the significance of which outstrips the limit of any experience that might provide their content. Among such ideas were those of 'God,' 'substance,' 'cause,' and 'self,' upon which the rationalist worldview had raised its foundations. It is this assumption that the new philosophy of language was to deny.

"...Hobbes sought for a theory which would tell him how words acquire meaning, in order to demonstrate that certain metaphysical doctrines are, quite literally, meaningless. Like later empiricists [e.g. logical positivists], he was tempted to reject not just this or that metaphysical doctrine but the *whole* of metaphysics, as a science forced to use words in a manner that transcends the limitations which determine their sense..." Scruton continues:

In common with many other empiricists, Hobbes gave a genetic account of the origins of meaning: words acquire meaning through representing "thoughts," and the origin of all thought is sense-experience, "for there is no conception in a man's mind, which hath not first, totally or by parts, been begotten upon the organs of sense." In order to discover the meaning of any utterance, we must trace it back to the observable circumstances that gave rise to it; these will suffice to determine the thought that the utterance contains. Hobbes went on to argue that, because sensory experience gives us knowledge [only] of particulars, then the words (names) which express our thoughts must ultimately have reference to particulars. Thus a general term (e.g. tree) could not denote a "universal"; rather it denotes indeterminately the particular members of a class. In this way Hobbes expressed a thought already familiar in the works of Ockham. He perceived a connection between empiricism and nominalism. One of the principal preoccupations of succeeding empiricist philosophy was to determine just what this obligatory nominalism amounts to, and how far it is tenable without the simultaneous denial of scientific thought.

Locke, too, began with a theory of meaning, which was essentially a fuller form of Hobbes'. Berkeley and Hume continued in this tradition.

Now that I think about it, it's striking the extent to which Russell and the logical positivists were following in the footsteps of Hume and the earlier British empiricists. None of these thinkers has to be committed to the *tabula rasa* conception of the mind, but they all do emphasize sense-data or sense experience over anything else, including the structuring and self-projecting capacities of the mind. (It's true Hume argues that the mind "spreads itself upon objects.") Their perspective also naturally lends itself to subjective idealism (or at least *skepticism* about an external world (among other things¹)) and solipsism, since the project of constructing the world out of sense impressions can easily render the notion of mind-independent entities otiose. Hence you have Russell (and his followers) "proposing to construe every entity in the world other than sense-data as a 'logical construction.' Whether or not we *do* mean, when referring to tables, to refer to logical constructions out of sense-data, it is, Russell thought, all that we ought to mean. As he put it, 'wherever possible, logical constructions are to be substituted for inferred entities.'" But it's impossible for us not to *constantly* rely on the assumption of "inferred" entities, as when we assume that a chair continues to exist when we aren't looking at it. Or when we give a causal explanation for something. It's true that the table's appearance exists only for the subject, and is in that sense "unreal" (mind-dependent), but we don't or can't *act* on that truth. Moreover, there *must be* mind-independent things of *some* sort, because otherwise the success of science (which invokes such theoretical entities) would be inexplicable.

¹ The "other things" include the concepts of causation, identity through time, the self, etc., because, at least according to Hume, we have no distinct "impressions" of these ideas. They are constructed by the imagination "from the fragmentary deliverances of sensation."

In some ways I'm sympathetic to empiricism—to its tendency toward skepticism, for example. I disagree with its emphases and with certain doctrines to which it can lead, such as Carnap's instrumentalism and Berkeley's idealism.

It's ironic that rationalism, too, like empiricism, has been prone to various kinds of idealism. Both traditions have at times tended to “abolish the distinction between thought and reality, thus displaying the principal characteristic of idealism.”

A note on Kant: I suspect I'll always be baffled at most philosophers' aversion to the idea of the synthetic *a priori*. Leaving aside the question of whether this or that proposition falls under such a category, it can hardly be doubted that the human mind is continuously applying synthetic *a priori* “categories of the understanding” that shape experience. Substance, causality, identity through time, etc.: these “concepts” are in fact deep structures of experience and have the character of necessity, as shown by the fact that fundamentally it is impossible not to believe that this table is a self-identical object persisting through time, subject to the law of cause-and-effect. You can *say* “I don't believe in causation or this object's identity through time, etc.,” but you'll continue to act as if you do—because you do. As you act in the world, you find these concepts self-evident. Similarly self-evident, perhaps, to $2+3=5$.

By the way, sometimes I think Kant's philosophical importance is overestimated. Wasn't he basically just an idiosyncratic and particularly profound rationalist? And a skeptic about our pretensions to understand the world as it really is? Scruton thinks he was more “special” than that, but I don't see how. Indeed, considering Hume's half-appreciation of the fact that the mind structures experience, Kant's epistemology and metaphysics don't seem so vastly different from Hume's.

Scruton makes the very good point that Nietzsche's morality was largely a restatement of Aristotle's. Two “aesthetic” moralities. Human excellence is the goal. Don't suppress the passions but order them rightly. “Moral development requires the refining away of what is common, herd-like, ‘all too human.’ Hence this ideal lies, of its nature, outside the reach of the common man.... Aristotle called this ideal creature the ‘great-souled man’ (*megalopsuchos*); Nietzsche called it the ‘*Übermensch*.’ In each case pride, self-confidence, disdain for the trivial and the ineffectual, together with a lofty cheerfulness of outlook and a desire always to dominate and never to be beholden, were regarded as essential attributes of the self-fulfilled man.”

In his discussion of Frege, Scruton says the following. “Numbers [for Frege] at last fall from the Platonic heaven in which they had been enshrined. Frege moves closer to the view that numbers are, in Russell's phrase, ‘logical fictions’; the science of mathematics was soon to be construed, not as the exploration of an independent realm of timeless entities, nor as a prime example of synthetic *a priori* knowledge, but as the projection into logical space of our own propensities towards coherent thought. What appears as an independent realm of mathematical entities or mathematical truth is simply a shadowy representation of our own intellectual powers. The number one is no more an entity than ‘the average man’....” That's basically what I argued in my paper on ontology, not knowing that Russell had argued it too. I argued that *all* concepts, and all words, are essentially fictions. Actually, now that I think about it, I should have made a distinction between concepts like “the average man” or “the English nation” and concepts like “chair” or “house”: the former are fictional in a second sense too, unlike the latter. But I don't care, this stuff doesn't interest me much.

A note on Wittgenstein. On the obligatory private-language argument, the most revolutionary thing since the invention of the wheel. My hat is off to you if you can make heads or tails of this:

...In outline, it seems to me, the argument is as follows: there is a peculiar “privilege” or “immediacy” involved in the knowledge of our own present experiences. In some sense it is nonsense to suggest that I have to find out about them, or that I could, in the normal run of things, be mistaken. [So far, so good.] As a result there has arisen what we might call the “first-person illusion.” I can be more certain about my mental states than about yours. [Here we go. Get ready to abandon reason.] This can only be because I observe my mental states directly, yours indirectly. When I see you in pain, I see physical behavior, its causes, a certain complex state of an organism. But this is not the pain that you have, only some

contingent accompaniment of it. The pain itself lies hidden behind its expression, directly observable to its sufferer alone. [Yes. Did you not, in effect, admit as much in the first two sentences above?]

That is, in brief, the Cartesian theory of mind, presented as an explanation of the first-person case. Both the theory, Wittgenstein argues, and the thing that it is put forward to explain, are illusions. Suppose the theory were true. Then, Wittgenstein argues, we could not refer to our sensations by means of words intelligible in a public language. For words in a public language get their sense publicly, by being attached to publicly accessible conditions that warrant their application. These conditions will determine not only their sense, but also their reference. The assumption that this reference is private (in the sense of being observable, in principle, to one person alone) is, Wittgenstein argues, incompatible with the hypothesis that the sense is public. Hence, if mental events are as the Cartesian describes them to be, no word in our public language could actually refer to them. [Sophistical nonsense.]

In effect, however, Cartesians and their empiricist progeny have always, wittingly or unwittingly, accepted that conclusion, and written as though we each describe our sensations and other present mental episodes in a language which, because its field of reference is inaccessible in principle to others, is intelligible to the speaker alone. Wittgenstein argues against the possibility of such a private language. He attempts to prove that there can be no difference made, by the speaker of that language, between how things seem to him and how things are. He would lose the distinction between being and seeming. But this means losing the idea of objective reference. The language is not aimed at reality at all; it becomes instead an arbitrary game. What seems right is what is right; hence one can no longer speak of right.

The conclusion is this: we cannot refer to Cartesian mental events (private objects) in a public language; nor can we refer to them in a private language. Hence we cannot refer to them. But, someone might say, they may nevertheless *exist!* To which Wittgenstein replies, in a manner reminiscent of Kant's attack on the noumenon, that a nothing will do as well as a something about which nothing can be said. [The predictable fetishization of language. There is no reality outside language, etc.] Moreover, we *can* refer to sensations; so whatever they are, sensations are not Cartesian mental events.

Wow. Perversity.

After reading the *Stanford Encyclopedia of Philosophy's* article on the subject, I'll make a few comments (none of which comes from the article). First of all, let's get clear on what we can and can't do. We can refer to private mental experiences like pain in a public language; that's what I'm doing when I say, "I feel a stabbing pain in my leg." You can't feel it; only I can. But I just referred to it in a way that you understand. On the other hand, you don't "experience" my utterance in precisely the way I do, because for me the utterance is, so to speak, directed at a particular private sensation I feel in that moment. The "significance" of the utterance is different for me than for you, who only hear the words and abstractly understand that some sensation of mine "corresponds" to them. A better example is the statement, "This pain really hurts!" I have a particular feeling in mind when I say that, and the "combination" (so to speak) of that feeling and the sentence—the sentence denoting that feeling—is, for me, my utterance's meaning or significance. Its meaning/significance for you is simply the sentence's linguistic meaning together with your understanding that I'm experiencing something painful that has elicited the utterance.

Now, if a "private language" is such that (as Wittgenstein says) "The words of this language are to refer to what can be known only to the speaker; to his immediate, private, sensations," then when I refer to an "immediate, private" sensation of mine in words you understand, I'm speaking a private language.¹ The possibility of such a language, therefore, is self-evident, since people use it frequently. But Wittgenstein is

¹ [Well, if you think about the quotation carefully, it can be interpreted in such a way that that sentence is not true.]

mistaken when in the next sentence he says, “So another cannot understand the language.” You understand the language I’m speaking perfectly well when I say, “This pain in my leg is intense.” What you *don’t* grasp in quite the same way I do is the reference of the words “this pain” (because you’re not experiencing the sensation). Their sense is public, their reference is private. I don’t see any logical inconsistency there.

If, on the other hand, a private language is something you create yourself, whose words—which refer to private sensations—you try to ostensively define by making some sound and at the same time directing your attention to a particular sensation,¹ then yes, it is impossible. As I noted many years ago, borrowing from Hegel (who, I suspect, basically anticipated all this silly private-language stuff), full linguistic meaning requires *mediation*. Conceptual mediation. The bringing of concepts and sentences into *necessitous* conceptual and logical relations with each other. Their implicit interrelations have to *force* themselves on you, so to speak, so that you have no choice in the matter. That’s just the nature of meaning: in having a determinate content it has to be rule-governed, which means that your correct use of the word can’t be up to you, your “free will.” But in order for your free will to be removed from the equation, you can’t teach the language to yourself; you have to learn it from others, who *give* you the determinate meanings of words and *correct* you when you make a mistake. Or, at the very least, a community of people have to develop the language together, correcting each other when necessary. Language presupposes the internalization of others, i.e. the existence of an abstract other in consciousness. Why? Because, again, it is the other who provides the element of resistance to your free will, and linguistic meaning depends on your internalization of such resistance. It can’t be the case that whatever *seems* right to you *is* right.

The author of the encyclopedia article says the following when giving examples of philosophical notions and theories that ostensibly presuppose the possibility of the sort of private language I just declared impossible.

For example, a still very common idea, often attributed to John Locke and openly embraced by Jerry Fodor in the 1970s, is that interpersonal spoken communication works by speakers’ translation of their internal mental vocabularies into sounds followed by hearers’ re-translation into their own internal vocabularies. Again, Descartes considered himself able to talk to himself about his experiences while claiming to be justified in saying that he does not know (or not until he has produced a reassuring philosophical argument) anything at all about an external world conceived as something independent of them. And he and others have thought: while I may make mistakes about the external world, I can infallibly avoid error if I confine my judgments to my immediate sensations.... Again, many philosophers, including John Stuart Mill, have supposed there to be a problem of other minds, according to which I may reasonably doubt the legitimacy of applying, say, sensation-words to beings other than myself.

It seems to me you can deny the possibility of a private language and yet consistently subscribe to all those positions. Fodor’s idea just seems downright plausible, in fact utterly obvious, and I don’t see how it requires private languages. Same with Mill’s. (It might not be *reasonable* to doubt that others have sensations, but the possibility is at least vaguely conceivable, because you don’t experience their sensations.) Same with Descartes’. Even if Descartes’ ability to talk to himself entails that he learned language from others, those others could still, in principle, have been projections of his mind. We’re dealing with a radical skeptic, after all. If he argues that *he*—his self, his free will—did not teach himself French but was taught by some unconscious projective capacity of his mind, or by God, it is perfectly consistent for him to both accept the impossibility of a private language and doubt that other people exist.

In short, Wittgenstein’s argument isn’t as important as has been thought, though I suppose it is of *some* interest.

Modern life is predictable but governed by chance. Amusing paradox.

¹ “S means *this* feeling.”

Reading *The Prison and the Factory: Origins of the Penitentiary System* (1977), a Marxist study by Dario Melossi and Massimo Pavarini. I'm thinking of doing something relating to prison labor for my dissertation.

"This book seeks to establish the connection between the rise of the capitalist mode of production and the origins of the modern prison." It deals with northern Europe and Italy between the mid-1500s and the mid-1800s, and with the U.S. from the colonial period to the late 1800s.

It's too pithy to summarize, but I'll jot down a few things. Forty pages in is this statement: "In the proposals advanced by Jeremy Bentham, a major representative of the ascendant English bourgeoisie [in the first half of the 1800s], prison has reached its intermediate stage: the productivist and rehabilitative aims of its earlier days—aims which were revived during the Enlightenment—began to be overtaken by pure control and deterrence." Think of the Panopticon, solitary confinement, etc. Presumably Bentham's "intermediacy" is reflected in the fact that he is still attached to the notion of using prisons largely for productive work.

On the frontispiece of the volume in which the Panopticon was originally described appears this:

"PANOPTICON" or, the inspection-house: containing the idea of a new principle of construction applicable to any sort of establishment, in which persons of any description are to be kept under inspection [i.e., view]; and in particular to penitentiary-houses, prisons, houses of industry, work-houses, poor-houses, manufactories, mad-houses, lazarettos, hospitals and schools.

Dario Melossi elaborates: "One cannot sufficiently emphasize the interchangeability of the[se] various segregated institutions recently created by bourgeois society when Bentham wrote these pages. Over and above their specific functions, one overall aim united them: control over a rising proletariat. The bourgeois state assigns to all of them a directing role in the various moments of the formation, production and reproduction of the factory proletariat: for society they are essential elements of social control, the aim of which is to secure for capital a workforce which by virtue of its moral attitude, physical health, intellectual capacity, orderliness, discipline, obedience, etc., will readily adapt to the whole regime of factory life and produce the maximum possible amount of surplus labour." A few paragraphs later he provides a concise summary of Marx's theory of surplus-value, after reading which it is hard to understand how anyone could reject the doctrine.

An important theme running through the chapters on Europe is that the centuries-long expulsion of the peasantry from the land created at various times a large surplus population that couldn't find productive employment (and, in addition, often resisted the discipline of the wage-labor system). Vagabonds, beggars, thieves, prostitutes, starving families....society *teeming* with economically superfluous people.¹ A legal crackdown ensued to deal with all these unfortunates, and eventually workhouses, houses of correction, prisons, etc. popped up to help neutralize the threat they posed to "law and order" [and to take advantage of their labor power]. (Forced and encouraged emigration to the New World was another strategy.) A similar thing has been happening in the U.S. in recent decades—except that this time it's the *decline* of industry that has caused it.

....The two chapters on the U.S. briefly describe the different forms of prison labor in the nineteenth century. Here are the final two paragraphs of the first chapter:

Protests and agitation in the labour movement against penitentiary production continued right up to 1930, even if the question of competition between the two could be considered as effectively resolved by the end of the century. The official figures around the end of the nineteenth century and the beginning of the twentieth century are significant in this respect. In 1885, for example, 26 percent of all prisoners employed in productive work

¹ [Well, not always superfluous. Only in some parts of the continent, such as Italy.]

were under the leasing system [by which they were leased out to a private contractor]; in 1895, 19 percent; in 1905, 9 percent; in 1914, 4 percent; by 1923, one could consider the system as having been completely done away with. We can see the same thing occurring in relation to the contract system: in 1885, 40 percent of prisoners worked for private contractors [*inside* the prison, not out]; in 1923, this was down to 12 percent. There were other, even more important changes: in 1885, 75 percent of prisoners were employed in productive labour, whilst in 1923, the so-called productive prison population amounted to 61 percent. This last factor must then be related to the following: the public account system together with the state-use and public-works systems [according to which private companies did *not* hire prisoners] employed just 26 percent of prison labour in 1885, whilst by 1923 the percentage had risen to 81 percent.

Clearly the private exploitation of convict labour became obsolete as against the increasingly massive adoption of those systems of convict labour which did not compete with free labour. On the one hand, the basic reason can be traced back to the difficulties encountered by private capital when it came to industrializing the penitentiary productive process in forms that would still be competitive with technological innovations in the outside world. On the other hand, it was also located in the growing strength of the union organizations in the economic and political life of the United States. [Many businesses, too, opposed convict labor on the grounds that it gave their competitors an unfair advantage.] Thus at the beginning of the new century, the penitentiary ceased to be a “productive concern”; in fact budgets once again began to show growing deficits.

As unions got more powerful, the private exploitation of prison labor declined; as unions have gotten less powerful in the last thirty or forty years, prison labor has increased and prisons themselves have begun to be privatized.

March, April

Presented a much-shortened version of my meatpacking paper at a conference in Omaha, Nebraska. Only the second conference I’ve ever attended, the first being at UMSL. Nice people everywhere, some charming young ladies who unfortunately don’t live in Chicago. Mostly very arcane and boring topics being presented, but that’s to be expected. (How pious was King Edward II? Etc.) A classy event but, I don’t know, I can’t overcome my instinctive aversion to this sort of academic onanism.

Speaking of which: according to the website on which it’s posted, my Master’s thesis has been downloaded hundreds of times. Which already makes it more widely read than most academic publications.

I suggested that Chomsky post some of his old syllabi online; he wrote back, “Afraid I was never organized enough to have syllabi. Courses just evolved, week after week, often in unexpected directions. I have lots of notes, which will presumably end up in the MIT archives, for what they’re worth.” I wish I had taken a class with him!

Reading *Punishment for Sale: Private Prisons, Big Business, and the Incarceration Binge* (2010), by Donna Selman and Paul Leighton. What’s going on in the prison-industrial complex is almost literally unbelievable. Here’s a one-sentence summary of the monumental injustice: “While the United States has a long history of the rich getting richer while the poor get prison, the current situation—private prisons listed on the stock exchange and an expanding number of businesses profiting from the expansion of the criminal justice system—means that rich whites get richer *from* poor minorities being sent to prison.” In 1995 a Latino army veteran with three children was sentenced to a mandatory fifty years in prison for stealing some children’s videos on two occasions. The sort of thing that happens all the time.

How do private companies make profits by managing prisons? By viciously cutting costs more than governments can or will. The government pays them a per diem rate per prisoner, and the company does everything it can to reduce costs so that as much of the per diem rate as possible is kept as profit. (One major strategy is to slash labor costs.) The more prisoners are incarcerated, the more money the company makes. So the industry has an incentive to lobby for harsh laws, as it has done effectively. It also favors crackdowns on undocumented immigrants, since they can be incarcerated.

In addition to the fees they charge governments, companies can make money from prison labor.

As for whether privatization saves taxpayers money, the research has been inconclusive. Some reports have found that it actually costs more money, while others have suggested that privatization yields savings of about 10 percent. But these reports haven't factored in all the extra costs associated with privatization, such as the time and money it takes to review proposals by various companies, negotiate contracts, review contract terms, deal with lawsuits resulting from the terrible conditions in some private prisons, renew contracts, etc. Companies have also been known to over-bill governments and not repay them.

Reading *At Hard Labor: Inmate Labor at the Colorado State Penitentiary, 1871-1940* (1993), by Elinor Myers McGinn.

Today I attended a talk by the famous mediocrity Nancy Fraser, in which she tried to explain capitalism's current crisis by expounding and critiquing Karl Polanyi's ideas. It was pretty poor stuff, ludicrously pretentious and totally unnecessary. Afterwards I asked a question: "Given all your criticisms of Polanyi, in particular your concern with relations of domination, why don't you just use Marx instead (who I think has a much more powerful theoretical framework)? But aside from that, I don't see the need for some grand theory in order to explain the connections between the three sets of crises you mentioned (the ecological, the economic, and the 'social-reproductive'). All you have to do is invoke the Marxian idea that capital, or big business in this case, exploits labor-power and accumulates capital, and in so doing harms the environment, wrecks the economy (or causes it to go from boom to bust—for the reasons Marx gave, or his disciples, like David Harvey), and disrupts social reproduction. That intuition seems like enough of a foundation for explaining these crises." She fumbled for a while as I nodded and grunted politely.

Later I went to an Occupy Chicago meeting, specifically of its Labor Outreach Committee. About 25 people. Here's part of an email I sent Ed Hunt: "It went on for several hours, and eventually I left. It was relatively well organized (especially compared to other committees, from what I've heard), but even so it reminded me of the retrospective accounts written by 1960s activists of how frustrating and interminable all their meetings could be. Why do people always feel the need to talk, even when they have nothing to say? They just go on and on—and they all have to put their two cents in! It's definitely true that democracy can be damned inefficient. —You know, I love the idea of democracy, but when it comes to procedural, political things like this I don't love participating. I'm kind of a hermit by nature (maybe we're similar in that regard); in fact, I'm temperamentally disinclined to activism, preferring to read and write and talk to people in intimate settings. So I don't know if I'll do this Occupy Chicago thing in a sustained, intensive way. I'll have to think about it."

Nancy Fraser and some of these volunteer activists are similar in that they both like to verbally jerk themselves off. But I'll say this about the activists: at least they're trying to change the world. They may be annoying, in love with the sound of their voice, socially clueless sometimes, other times cocky and prickish, but they're doing the right thing.

Reading *Discipline and Punish*. One of the reasons for Foucault's fame is the quality of his writing: there's a creativity, a forcefulness, a style that probably overawes a lot of feeble-minded academics who are willing to be impressed by that sort of thing when it's manifested by one of their own.

But there is also the fact that Foucault's obsession with power relations, his obsessive insistence that they permeate every facet of society and even the individual's mind, and that the *subject* is wholly a product of *subjection*, can be contagious. It really drives the point home. Even the dull-witted academic reader can start to think, "Hey, yeah, *power!* And discourses, and disciplines, and the fusion of power and knowledge—and hey, I'm an intellectual, so that's great for me—and all these cool terms like 'political

technologies' and 'political anatomy' and 'vectors of power' and 'micro-physics of power'! What a magnificent theoretical vision!" It helps that Foucault avoids talking about business and class relations, which means that society's central power-structures have no particular reason to be very hostile to him. It's striking how un-original it all is, though. E. P. Thompson's work shows how the modern subject has had to be disciplined—for the [direct or indirect] sake of capital accumulation, which Foucault tends to ignore; and then there's Gramsci (whose ideas themselves are pretty obvious), and Freud, and Nietzsche, and Marx, and a galaxy of lesser-known thinkers who have dissected the workings of power. But Foucault had a gift for self-promotion, so he became a celebrity.

And what's all this blather about "the body"? He goes on and on about how important the body is. Yes, I agree, bodies are important. And they're objects of power, etc. Again, the reason this jargon became so popular among academics is that feminism and the sexual revolution turned society's attention to the body—to women's (lack of) power over their bodies, to cultural interpretations of the body and sexuality, etc. Also, this kind of talk is conveniently un-Marxist, which is always good for having a smooth and successful career. It's basically a middle-class preoccupation—as most things "subjective" are—something that middle-class people have the luxury to think about, wondering what their attitude is toward their body, whether it's healthy or whatever, how society has influenced and perverted their relationship with their body. Actually, this intellectual turn toward subjectivity and the body is a symptom of the feminization of society since the 1960s, as decadence has set in (to quote Susan Sontag). With atomization has come a preoccupation with subjectivity, the self's insecurity; hence feminization.

....A nice thing about reading Foucault is that his prose is so prolix you can skim through a lot of it without missing anything substantial.

Another nice thing, though, is that he's more interesting and substantive than his fellow postmodernist "pioneers." He actually has things to say, although it takes a lot of intellectual digestion to see what they are. The problem, again, is that his writing is diffuse and abstract, consisting of a strange stream of reflections on, in this case, crime and punishment and their evolution. It isn't really philosophy, as it's sometimes called, but it isn't anything else either. It's uncategorizable. It's like a bunch of notes to himself on how to understand the "meaning," given particular social contexts, of various crimes and punishments. Some of it makes me think of a historical phenomenology, while at other times I simply have no idea what's going on. "What *is* this stuff?" It's so abstract and self-indulgent you can't really pin it down, and after pages of reading you remember absolutely nothing of what you just read. Meaningless words passing under your eyes. It's comparable to the feeling of "zoning out" for a few minutes. (Not all of it is this bad, I should say.)

Another obvious problem is Foucault's idealism. He fixates on the opinions of reformers, philosophers, politicians, scientists, only occasionally descending to earth to note how things actually were. He's pre-Marxist, like most postmodernists. Or, if not exactly pre-Marxist, unsophisticated in ways that Marx should have reminded him not to be.

Now for Rusche and Kirchheimer's Marxist classic *Punishment and Social Structure* (1939), a more informative, interesting, readable, scholarly, and reliable book than Foucault's. They note that epochs of "entirely different systems of punishment" can be distinguished. "Penance and fines were the preferred methods of punishment in the early Middle Ages. They were gradually replaced during the later Middle Ages by a harsh system of corporal and capital punishment which, in its turn, gave way to imprisonment about the seventeenth century."

Why were things less harsh in the early Middle Ages? In part because there just wasn't much need or possibility for a system of state punishment. The law of feud and penance essentially regulated relations between equals. Even in the thirteenth and fourteenth centuries, systems of punishment didn't change much. "The relations between the warrior-landlords and their serfs were of a traditional character, tantamount to a precisely determined legal relationship. These conditions tended to prevent social tension and to provide that cohesion which was characteristic of the period. Criminal law played an unimportant role as a means of preserving the social hierarchy. Tradition, a well-balanced system of social dependence, and the religious acknowledgement of the established order of things were sufficient and efficient safeguards." Moreover, the violation of property rights "did not count much in this society of landowners." It wasn't so much theft

as offenses against decency, religion, or accepted morality that could pose a problem. But if that happened, usually “a solemn gathering of free men would be held to pronounce judgment and make the culprit pay *Wergeld* or do penance so that the vengeance of the injured parties should not develop into blood feud and anarchy.” It’s reminiscent of customs in some tribal societies. The basic point is that there wasn’t a strong central power, so private arbitration was necessary.

With the beginnings of the nation-state and early capitalism, things got more savage, as usual. Central authorities sought to strengthen their power by extending their judicial rights, which they also realized could be a fruitful source of income. Confiscations and fines brought in a lot of revenue.

Meanwhile, as you know, a surplus population was growing in various parts of Europe due to enclosures, the exhaustion of the soil, and other causes. Thus: pauperized masses, roving bands, etc. Corporal and capital punishment became very common (although wealthier criminals had the option of paying fines). All kinds of elaborate tortures were devised. “The whole system of punishment in the later Middle Ages makes it quite clear that there was no shortage of labor, at least in the towns. As the price paid for labor decreased, the value set on human life became smaller and smaller.”

Things started to change around the seventeenth century, as wars of religion and other disturbances interrupted the growth of population. Labor grew scarcer and more expensive; corporal and capital punishment, therefore, was less frequently applied, since criminals could be used as labor power. They were often sent to the military, for instance. There were still plenty of beggars and vagabonds, people who either couldn’t or wouldn’t work, but now they were sent to houses of correction where the men often did hard labor and the women made textiles.

“The roots of the prison system lay in mercantilism [in its attitude toward labor], and its promotion and elaboration were the task of the Enlightenment.”

By the second half of the eighteenth century and especially the first half of the nineteenth, the old conditions that had given rise, in the mercantilist period, to the “productivist” and “rehabilitative” system of punishment were disappearing. The population was growing dramatically and there was no longer a scarcity of labor power. “What the ruling classes had been seeking for over a century was now an accomplished fact—relative overpopulation.” To make matters worse for the working class, machinery was introduced and the Industrial Revolution occurred, raising unemployment even more. Houses of correction, therefore, ceased to serve their former productivist, educative, rehabilitative purposes—because there was no economic need for those—and conditions inside them deteriorated. There was overcrowding and all manner of horrors. In the nineteenth century the ruling classes were tempted to return to the pre-mercantilist methods of punishment, favoring corporal and capital punishment again, but the upshot was simply that conditions in prisons were allowed and encouraged to become atrocious. In light of the fact that prisons, far from making profit (as houses of correction had in former days), didn’t even pay for themselves anymore—since the advent of machinery had destroyed the value of work by hand, as in prisons (and in any case workers and employers fought vigorously against convict labor)—they became purely a means of deterrence and control. The idea was to make conditions so bad that the poor would refrain from stealing just so as not to be imprisoned.

In England and France, the problem of overcrowding was also addressed by deporting criminals to colonies.

The early U.S. had a scarcity of labor, so the Quaker system of solitary confinement didn’t last long. It made more sense to use prisoners as cheap labor power; therefore the Auburn system became popular, whereby they worked together (in silence) during the day and were confined in solitary cells at night.

Conditions improved in most of Western Europe in the late nineteenth century, as overpopulation and unemployment diminished, prosperity spread, and reformers advocated for more humane policies. “The new policy favored by reformers was to keep as many delinquents as possible out of jail by a more extensive use of fines, by a probation policy, and, above all, by seeking to ameliorate the social conditions responsible for crime.” Conditions in prisons improved too, and the length and severity of prison sentences declined. But then the World War happened, and then depression and fascism, and things went downhill.

“The Origins of Capitalism,” a 2004 debate between Chris Harman and Robert Brenner, is pretty interesting. I don’t agree with everything Brenner says, but he’s right about important points. For example, it’s true that commercialization (trade, involvement in markets), far from necessarily undermining feudal relations of production—as, supposedly, Adam Smith, Paul Sweezy, and Immanuel Wallerstein implicitly or explicitly contend—can strengthen or even create them, as in colonial Latin America.

The reason that the appearance of opportunities to exchange has failed by itself to bring on capitalism and development is twofold. In the presence of pre-capitalist social-property relations, pre-capitalist economic agents do not, in fact, find it in their interest (or often their power) to seek the full gains from trade, or pursue all-out capital accumulation, or adopt the best available techniques. Nor, equally important, do they find it makes sense for them to try to introduce, on a micro, piecemeal basis, capitalist social-property relations. This is most clearly true of feudal lords. Because the peasants upon whom lords depended to work their demesnes possessed the means of subsistence, they not only had little incentive to work on the lords’ estates but could not be disciplined with the threat of firing. As a result, lords found that to increase the surpluses they could sell on the market, their best route was to try to improve not the productivity of their peasants, but their ability to forcefully [he means forcibly] redistribute from them more of their product. This required tightening, not loosening, the feudal bond by building up their means to coercion through increasing the size, sophistication and equipment of their politico-military followers. The same tendency was imposed by the need to stand up to inter-lordly politico-military competition and the attractions of warfare as means of increasing wealth.

Thus, in some parts of Europe, expanding markets *reinforced* feudalism. Later on, too, in parts of the “global periphery,” semi-feudal relations were intensified and extended in time all the way up to the late twentieth century by the elite’s access to markets, which gave them an incentive to squeeze as much product as possible out of their forced laborers and effectively to obstruct the development of capitalist relations of production. This, of course, was one of the causes of those countries’ underdevelopment. (Marx’s idea that the dominance of merchant capital can interfere with the development of industrial capitalism is also apposite here.)

Brenner’s emphasis, as in his long and important essay “The Origins of Capitalist Development: A Critique of Neo-Smithian Marxism” (1977), is on class struggle as opposed to the mere extension of the market. Market competition doesn’t bring about self-sustaining economic growth and increasing labor productivity unless capitalist class structures already exist; and they are the result not of market competition—as though it could just automatically “bring them into being” somehow—but of historically specific conjunctures, political developments, class struggles. This is his argument against people like André Gunder Frank too—and Wallerstein—who attribute Third World underdevelopment to the overarching dynamics of the world division of labor. “They move too quickly from the proposition that capitalism is bound up with, and supportive of, continuing underdevelopment in large parts of the world [which it is], to the conclusion not only that the rise of underdevelopment is *inherent* in the extension of the world division of labour through capitalist expansion, but also that the ‘development of underdevelopment’ is an indispensable condition for capitalist development itself.” I’ve always sympathized with Brenner’s position. Underdevelopment in some place is surely not a necessary condition for development elsewhere (although it does contribute to it). And the reasons for underdevelopment in a given place have to do with politics and class struggles there—which fraction of the elite has the upper hand, etc.—and with the political-economic policies of the core capitalist countries in relation to that place.

In other words, dependency theory is inadequate. An economy oriented towards exports, even if it’s dominated by foreign capital, *can* help lay the foundations for sustained industrial growth. According to Barbara Weinstein’s article “Capital Penetration and Problems of Labor Control in the Amazon Rubber Trade” (1983), this is what happened with the coffee trade in Sao Paulo in the late nineteenth century. You have to take into account internal social relations and class conflicts in explaining such things.

Here's Brenner's interpretation of the English Revolution in a nutshell:

The rise of capitalism in agriculture provided the social forces behind the English Revolution. Because capitalism in England developed within a landlord shell, what remained of the feudal landed class was very weak, and the capitalist aristocracy was very strong. On the other hand, the bulk of what remained of a feudal class became directly dependent for its reproduction on the absolutist state, the offices and privileges it provided. Conflict arose because the monarchy and those that lived off the politically-constituted private property that it created—churchmen, officeholders, government financiers, chartered company merchants, industrial monopolists, and so forth—sought to strengthen the embryonic absolutist state. This they tried to do by increasing unparliamentary taxation so as to undermine landed class control via parliament, by building a structure of offices dependent on the crown to replace national and local government dominated by the landed classes, by creating a standing army, and by pursuing alliances with financial support from the Catholic absolutisms of Spain and France. Landlord capitalists, who had in a sense already emerged as the ruling class on the basis of their control over the economy's surplus, but who still did not entirely dominate the state, were the ones most threatened by the absolutist offensive. So the capitalist aristocracy provided the fundamental social base for the anti-absolutist revolutions of 1640 and 1688, which definitively overthrew the old order. In so doing, they undoubtedly had help from colonial merchants, as well as newly emerging industrial capitalists and perhaps traders associated with them, not to mention the traditional revolutionary classes par excellence, the urban artisans and shopkeepers.

Brenner pretty much always knows what he's talking about.

Incidentally, it's obviously true that commercialization, the "commercial revolution" and so forth, played a role in the rise of the capitalist mode of production. It's just that politics and class struggles were an essential part as well. (Stated this way, Sweezy wouldn't disagree.)

Now I'm reading the 2006 edition of Benedict Anderson's 1983 classic *Imagined Communities: Reflections on the Origin and Spread of Nationalism*. He's right to emphasize *print-capitalism* (after the 1400s) as having laid the basis for national consciousness. "Nothing served to 'assemble' related vernaculars more than capitalism, which, within the limits imposed by grammars and syntaxes, created mechanically reproduced print-languages capable of dissemination through the market." He goes on to say that these print-languages "created unified fields of exchange and communication below Latin and above the spoken vernaculars," so allowing speakers of one variety of French to communicate—through print—with those of a different variety. Thus is made possible, eventually, the birth of a national consciousness. Also, "print-capitalism gave a new fixity to language [which had hitherto been very changeable], which in the long run helped to build that image of antiquity so central to the subjective idea of the nation."

The importance of print-capitalism should be obvious, but seriously, take a moment to think about it. Without print....modernity is not modernity. You don't get the Reformation, science, the Enlightenment, the French Revolution, the Industrial Revolution, the nation-state, modern culture, ideologies like republicanism, liberalism, socialism.... As for nationalism (of whatever variety), it's true that "everywhere, as literacy increased, it became easier to arouse popular support [for nationalism], with the masses discovering a new glory in the print elevation of languages they had humbly spoken all along." It's all made possible by *print-capitalism*!

Now I'm reading Andre Gunder Frank's important work *Capitalism and Underdevelopment in Latin America: Historical Studies of Chile and Brazil* (1969). He makes dependency theory seem like common sense—which, to a great extent, it is. Its main flaws are its excessive abstractness, its undertheorizedness, and in general the criticisms made by Brenner. But you can accept those criticisms while retaining or rephrasing certain key insights.

The Food Wars (2009) is very informative and full of insights, since the author, Walden Bello, has a quasi-Marxist view of the world. His concern is with the recent global food crisis—its causes and its

possible revolutionary solutions. In the first chapter he places it in its historical context. It's the destruction-of-the-peasantry thing, etc. But I'll go into more detail.—

The first “international food regime” emerged in the second half of the nineteenth century; it “consisted of two food grids existing under the institutional canopy of a global free-trade system promoted by Great Britain.” The first grid was the settler agriculture in the U.S., Canada, Australia, and Argentina that specialized in the production of wheat and livestock for the industrializing metropolitan economies, and which displaced much European agriculture. (Hence, in part, mass emigration out of Europe.) It was based mostly on family labor, not large, capital-intensive farms. The second grid was the system of capitalist plantation agriculture in what became the global South, which specialized in sugar, tea, coffee, tobacco, and cocoa for export, as well as raw materials like cotton, timber, rubber, indigo, and copper. The plantation economy often coexisted with a peasant economy that helped sustain the plantations' workers (who themselves went back and forth between the two economies).

After the interregnum of war, depression, and protectionism in the first half of the twentieth century, the Bretton Woods food regime emerged. Family farms continued to be important in the developed world, but now there was more corporate control of farm inputs, agricultural trade, and the food industry. Developed states protected their agricultural sectors, especially the bigger and richer farmers, by means of tariffs and subsidies. (Agriculture was exempted from the disciplines of GATT.) Some reasons for the persistence of the family farm are the limits to the advantages of greater scale in agriculture and “a distinct logic that aims not simply at profit maximization but long-term survival as a family enterprise.” In the South they had developmentalism, a key feature of which was the advanced capitalist state's tolerance for import substitution policies that would help the growth of industry. Foreign investment tended to be strictly regulated, too, as in Japan, Korea, and Taiwan. “In agriculture, there was strong protection from imports in the form of outright import bans, quotas, and high tariffs.” Market relations continued to spread, however, and landlord exploitation intensified. Also, “food aid” programs (a consequence of the U.S.'s grain surpluses that it wanted to get rid of) undermined the barriers against cheap imports. To prevent peasant-backed radical movements, the U.S. sometimes went so far as to support land reform measures that stabilized the countryside and fostered industrialization, as in Korea and Taiwan in the 1950s. There were also attempts by the World Bank and other entities to improve agricultural productivity in the South through technical and financial support, which didn't succeed nearly as well as hoped.

So eventually came the neoliberal era, with its structural adjustment programs. In agriculture, these entailed “deregulation of land markets and the reversal of land reform policies originating in the national developmentalist era; drastic cuts in farm subsidies and price supports and the disengagement of both postcolonial states and the World Bank from irrigation support; the expanded use of agrarian biotechnologies and expanded commodification of seeds and seed reproduction; a marked and growing dependence on chemical, biological, and hydrocarbon farm inputs;....expanded cash crop production for export as animal feed; [the elimination of tariff and non-tariff barriers;] and the export of niche luxury goods, fresh fruits, vegetables, and ornamental flowers for the global centers of overconsumption.” The use of new synthetic compounds for tropical products like sugar also had an adverse effect on agriculture in the South. And then there was the emergence of the genetic engineering industry, which threatens to completely wrest control of production away from farmers and accelerate their conversion into rural workers (in part because corporations have monopolistic intellectual property rights that favor globally integrated production chains). And so on and so forth. Hundreds of millions of rural and urban poor have, as a result, been shunted off to gigantic slums. But there's hope, reader! Resistance movements have been spreading, and in the wake of the global recession, “deglobalization” has been occurring. Global production and supply chains are, according to Bello, threatening to wither away, and small-scale agriculture serving local and regional markets is starting to look more viable than capitalist industrial agriculture.

So what's causing the current (or recent?) food crises? I'll get to the reasons for the recent high prices of food later; more fundamental than such explanations, though, is the fact that structural adjustment in the developing world has led to massive food insecurity there. To explain how, Bello devotes much of the book to analyses of neoliberal restructuring in Mexico, the Philippines, Africa, and China. The first three were turned from net food exporters to net food importers by structural adjustment and trade

liberalization in the 1980s and after. The gutting of government budgets, “especially the drastic reduction or elimination of fertilizer subsidies,” was the key factor. But unfair trade practices by the EU and the U.S. also contributed: low-priced, government-subsidized beef and cereals from the West displaced native producers. Export-oriented agriculture, such as cotton production, usually couldn’t step into the breach successfully, again because of insufficient government investment [in the developing countries] and unfair trade practices by the West.¹ The upshot of IMF-imposed “depeasantization” (and deindustrialization) was that the regions became very vulnerable to price fluctuations: if international prices of food rose too high, millions of people would be left to starve unless their governments somehow intervened. This is what Malawi did in 2005, against the advice of the IMF and World Bank, thereby preventing a famine and turning the country once again into an exporter of food.

The basic and obvious problem with structural adjustment, according to the World Bank’s own Independent Evaluation Group, was that in “most reforming countries the private sector did not step in to fill the vacuum when the public sector withdrew.” Why not? For lots of reasons, among them poor infrastructure, an inadequately developed private sector to begin with, and, as Bello says, a lack of business confidence due to the terrible investment climate created by structural adjustment.

China, too, has been liberalizing its trade, which has devastated many farmers (sugarcane, soybean, cotton) and contributed to the recent slowdown in poverty reduction. More broadly, “the adoption [since 1984] of a strategy of urban-centered, export-oriented industrialization based on rapid integration into the global capitalist economy” has harmed the peasantry greatly, since the urban industrial economy has been built on the backs of peasants.² Heavy taxation of peasant surpluses and falling prices for agricultural products have transferred income from the countryside to the city. Health, education, and agricultural infrastructure haven’t improved. Moves toward a regime of full private property rights in the countryside have been taken, which could cause a capitalist transformation of agriculture. (Big landlords, rural laborers, etc.) And of course millions of peasants have been forced off their land to make way for dams and urban environments. The result of all this is massive peasant unrest and China’s loss in 2008 of its status as a net food exporter.

Getting to the more immediate causes of the crisis.... An important reason for the disastrously high and volatile prices of food between 2006 and 2008 (and probably later, I assume) was the higher global production, stimulated largely by U.S. and EU government demand, of *agrofuels*, mainly ethanol and biodiesel, and the corresponding rise in demand for corn, sugar, beets, and wheat, which are the raw material for these fuels. Midwestern America, for example, is “slowly being transformed into a giant agrofuels factory”: in 2008, about 30 percent of corn was allocated for ethanol.³ As usual, much of the incentive for corporations to invest in agrofuels (or biofuels) is due to government subsidies, begun (in the U.S.) under Bush. Biofuels are in fact not very good for the environment, but policymakers want “energy security,” you see, so they subsidize the production of these fuels for transportation purposes. The agricultural systems in the U.S. and EU can’t fill the targets set by policies, so agrofuel production is dramatically increasing in the South too, including Latin America, Southeast Asia, and Africa. (Some of this production is for the sake of the Southern countries themselves, which likewise desire energy independence.) Rainforests are being cut down and workers are being treated like slaves.

Agrofuels production also compromises development in poor countries, “where households typically spend about half their income on food.” Ergo, with higher food prices, less money is spent on other items that can stimulate economic growth, and more people are forced into poverty.

To quote Via Campesina, “The contemporary food crisis is not really a crisis of our ability to produce. It is more due to factors like the food speculation and hoarding that transnational food corporations and investment funds engage in, the global injustices that mean some eat too much while many others don’t

¹ Export agriculture had made some progress in the era of developmentalism because of government assistance. But neoliberal dogma forbade this.

² Industrialization is almost always at the expense of peasants and farmers in some way or other. Think, for example, of Soviet and Chinese collectivization—squeezing surplus out of agriculture and transferring it to industry.

³ I needn’t point out that this also means less corn, wheat, etc. is used for *food*. So food prices go up.

have money to buy adequate food and/or lack land on which to grow it, and misguided policies like the promotion of agrofuels that devote farm land to feeding cars instead of feeding people.”

*

One of the confusing things about fascism is that the term denotes at least two different phenomena: a peculiar kind of social movement, and, more loosely speaking, the interlocking of government and big business.¹ I.e., state capitalism. Robert Brady discusses the latter in *Business as a System of Power*. According to this meaning of the term, at least the last 100 years or so have been the age of fascism—including, paradoxically, in Communist countries, where the state and “business” have been virtually the same thing. (So it’s a different sort of fascism than in the West.)² In retrospect it’s not surprising that the origins of the state capitalist kind of fascism coincided with the classic form of the social movement called “fascism,” nor that over time—after World War II, in other words—states learned to navigate their fusion with big business in a less dangerous way, by trying to keep within limits the fascist nationalism that had reigned earlier (and that had been, at least before 1939, in the interest of state capitalism). The potential for such a movement remains, however, because of the continuation of “fascism” in Brady’s technical sense.

*

Gillian McGillivray has some useful comments on the Spanish-American War. “Between April 1898 and March 1899, President William McKinley sent some forty-five thousand American servicemen to occupy Cuba for an undefined period of time. This was the first of a series of twentieth-century U.S. interventions in Latin America supposedly to help flailing nations free themselves from tyranny and establish democracies. In fact, interventions occurred wherever revolutionaries threatened foreign interests and U.S. capitalists had enough investments at stake to force their government to buttress dependent elite regimes. U.S. forces intervened thirty-four times in nine Latin American countries between 1898 and 1934. Good Neighbor policies from the 1930s onward prompted instead non-recognition of radical governments and behind-the-scenes maneuvering for more U.S.-friendly regimes.

“The most common characteristic of these interventions (beginning with Cuba) was the U.S. administrations’ need to portray them as motivated by humanitarian generosity when what really drove them was U.S. capitalists’ desire for new markets. By the late nineteenth century, many U.S. industrialists were ready to export goods, to import and process primary resources, or to set up export industries abroad. These industrialists lobbied the U.S. government to lower import tariffs. In direct contrast, many U.S. agricultural producers continued to depend almost entirely on protectionist tariffs. Sugar had one group in each camp: U.S. sugar refiners and brokers wanted low tariffs for importing raw sugar from abroad, while most producers of beet sugar in the western United States and cane sugar in the southern United States wanted higher tariffs....

“Within this framework, one can understand the contradiction between what U.S. politicians said they were doing and what they actually did in Cuba and the rest of Latin America. The hypocrisy began with the myth that U.S. forces invaded Cuba to help the Cubans win freedom from Spain. The actual goal was to preclude a social and racial revolution (‘another Haiti’) and to create a new, dependent, and politically moderate Cuba safe for U.S. capital...”

*

Coffee and Power (1997) is a very good book about Central America’s second “revolutionary decade” (after the 1930s), the 1980s. It focuses on El Salvador, Nicaragua, and Costa Rica (which didn’t

¹ [I forgot the third meaning: a state that shares crucial features with classical fascist states.]

² It’s surely more confusing than enlightening to call the USSR and others fascist, since their economic, social, and political dynamics were so different from the West’s. Nonetheless, there are parallels.

experience the civil war that the other two and Guatemala did, because of its stable social democratic structure). “The revolutionary crises of the 1980s were crises of the coffee elites and the societies they made at the end of the nineteenth and the beginning of the twentieth centuries.” You know, the polarization between the old family-based oligarchies—centuries-old dynasties effectively running the countries—and the impoverished masses. The coffee elite and other dynastic families had immense power, but their political regimes had only barely survived the 1930s “by ceding direct rule to military dictatorships (even in Costa Rica [for a short time]....)” Later, “the long economic boom in Central America and the world economy after 1945 created new social and economic forces that could not be contained in the rickety oligarchic-dictatorial structures of the twentieth-century political order. The end of this boom after 1973 detonated the social explosion that had been gathering force throughout the long period of postwar economic expansion.” Good ole Marxism, i.e. common sense: new productive forces and changes in social and/or technical relations of production slowly sweeping aside older production relations and property distribution, eventually—through the agency of the masses and of intra-“elite” competition—bursting their fetters and those of existing political relations, etc. This abstract schema is most appropriate for truly revolutionary transitions between forms of society, such as that between feudalism and capitalism, but it seems appropriate on smaller scales too. (On such scales, however, no “bursting of fetters” need go on; in general terms, it is safer to speak merely of *repercussions* in the realm of politics, culture, and so forth.¹)

The agro-export sector was primarily responsible for the new social forces. “The rapid expansion of sugar, beef, and, above all, cotton production in Central America after World War II began to challenge the coffee monoculture that was the basis of the old order. The coffee industry itself experienced a substantial expansion and technical transformation.... The expansion of the Central American common market in the 1960s, particularly in El Salvador, created a nascent industrial bourgeoisie.”

All this was disastrous for the rest of the population, still heavily rural.

The dramatic expansion of both cotton and cattle created massive displacements of the rural population of a magnitude not seen since the days of the Liberal land tenure revolutions of the nineteenth century. All of the new export crops, including the new coffee system, were more capital- and less labor-intensive than the systems they replaced. Unemployment increased dramatically as owners cleared unproductive serfs and squatters from their lands and replaced payment in subsistence rights and kind with cash wages and rents. The massive displacement of the rural population from the land created two new classes unseen before in Central America—a semi-proletariat of part-time wage laborers, renters, and subsistence farmers, and an urban informal sector of petty merchants, artisans, and day laborers. In many cases the two classes converged into a great mass of desperate people with no firm ties to the labor market, the institutions of property, or the societies of which they were a huge majority.

The precariat, created in part by the Green Revolution and associated developments. What happened in those decades reminds me of what happened in early modern Europe. Actually, in both cases the expulsion of the peasantry from the countryside took centuries; the Green Revolution and other things going on recently (in China, for example) have been simply the last stage of it in much of the world. Anyway, the parallels are striking. English landowners getting rid of peasants and the commons when sheep pasturage became very profitable; later, Third World landowners getting rid of remaining peasants, squatters, etc. when the land became profitable. An influx of people into insufficiently industrialized urban areas (not enough jobs) and shantytowns, as higher education simultaneously expands and radical intellectuals appear who help foster and guide discontent. New parts of the economic elite, too, that are less attached to the *ancien régime* than older economic groups are; in fact, the formers’ interests often lie in the overthrow of

¹ [Obviously on such “smaller,” non-transitional-between-different-modes-of-production scales, it is *technical*, not *social*, relations of production that are in question. I.e., the “forms of surplus-extraction” remain the same while the ways in which the productive process itself is organized change (as technology changes, etc.).]

the old order. So popular discontent can get support from them, and they can help guide it—and ultimately be its main beneficiaries. (This is what happened in Central America, where much of the economic elite in Nicaragua supported the Sandinistas against Somoza and eventually in El Salvador came to support a negotiated settlement with the rebels.)¹ So you get the English civil war and Glorious Revolution, the French Revolution, 1848, the 1917 Russian revolutions—of which the bourgeoisie lost control, succumbing to self-proclaimed representatives of the oppressed masses—Central America’s civil wars of the 1980s, and the Arab Spring.² [Yes, there are important differences between these events. Obviously.]

“An increasing body of research indicates that it was these growing classes of unemployed and underemployed rural semi-proletarians and urban informal sector workers, joined, in the case of El Salvador, by a small but well organized formal proletariat in the Common Market manufacturing sector, that made the mass base of the revolutions.” Like with the Arab Spring. (Students, too, were important in both cases.)

“The coffee export economy created the oligarchic political structures of Central America; cotton and cattle destroyed them.”

On the nineteenth century: “The revolution from above instituted by the nineteenth-century Liberals was a disaster for most of the population. The most direct assaults on the people were the land and labor laws that abolished communal control over the land by indigenous communities, sold off the commons and public lands to large holders, and instituted systems of state control over labor with varying degrees of stringency. The subsidies, infrastructure improvements, and special concessions went entirely to benefit the elite. The pattern of concentrated land ownership in the agro-export sector and mass poverty and landlessness among much of the population in the 1980s was a heritage of the Liberal revolutions of the 1880s.”

Paige, the author, goes into great detail on the class composition of the elites in the twentieth century, and on the economic differences between each country (including Guatemala). The basic point is that the elite in each country is or was composed of two fractions, which until the 1980s were fairly united: the agrarian (landowners, reactionary because of the need to control labor) and the agro-industrial (manufacturers, less reactionary, especially in the 1980s). In Costa Rica, the agro-industrial dominated; hence (in part) the country’s relatively progressive politics since 1948. In Guatemala and El Salvador—especially the former—the agrarian was stronger; hence reactionary politics. In Nicaragua, neither fraction was highly developed....until late in the postwar era, when the technological developments mentioned above strengthened the agro-industrial elite (and to a lesser extent the agrarian), which then largely supported the Sandinistas.

“The rise of the agro-industrialists and the semi-proletariat created [in the 1970s] a revolutionary crisis not only between the popular classes and the elite but between the two fractions of the elite itself. During the 1980s, immense revolutionary pressure from below began to cause the two fractions of the elite, united in all previous crises, to split apart. By 1992 the agro-industrial elite had managed to separate itself from the agrarians everywhere except in Guatemala, and the agrarian order and the authoritarian regimes that had supported it were in ruins. The ultimate beneficiaries of the revolutionary crisis of the 1980s were the agro-industrialists. By 1992 they had emerged triumphant everywhere, again except for Guatemala. In the three cases that are the focus of this study, class relations in 1992 converged on a single pattern—a dominant agro-industrial elite divested from a now largely defunct agrarian fraction, and a large and ever increasing semi-proletariat. The three societies had also converged on the common political form of representative democracy, and the common economic program and ideology of neoliberalism.”

The book follows in the tradition of Barrington Moore, while dissenting from some of his specifics. As Paige says,

¹ Moreover, the ultimate outcome of the so-called revolutions was....neoliberalism, in the 1990s. Good for the elite, not so good for the masses.

² It’s true that some of those examples, and others in history, involved a still-enormous peasantry. But the urban population, much of it having only recently left the land, was crucial too.

In *The Social Origins of Dictatorship and Democracy* Moore argues that democracy is a product of a “bourgeois revolution” against a backward landed aristocracy (“no bourgeoisie, no democracy”),¹ that authoritarian “fascist” regimes result from a coalition between a dominant landed aristocracy and a weak bourgeoisie, and that socialist revolution occurs when a massive revolt of cohesive peasant villages overwhelms landed and bourgeois classes weakened by a powerful agrarian bureaucracy.... Moore, like many other theorists, both Marxist and non-Marxist, traces the development of democracy to a “bourgeois revolution” in which a rising industrial bourgeoisie and its political allies defeat the entrenched political power of the landed aristocracy. The defeat of the Southern slaveholding aristocracy by the industrialists of the North in the U.S. Civil War is one of Moore’s paradigmatic cases. The failure of bourgeois revolution can open the way to conservative authoritarianism (what Moore calls “fascism”) through the continued dominance of the landlords, as in Moore’s implicit comparative case of Germany. Given the close ties between the agrarian and agro-industrial fractions of the elite the prospects for a democratic resolution in the case of Central America are not [i.e., *were* not] promising. The inability of the agro-industrial fraction to separate itself from, much less defeat [at least until the late 1980s or 1990s], the agrarian fraction, as well as the heavy weight of agriculture in the economic base of the elite as a whole, suggest that conservative authoritarianism would be the expected outcome. To this extent the Central America past provides convincing confirmation of Moore’s thesis.

He goes on to say, “The dependence of the landed elite on what Moore calls ‘labor repressive agriculture’ is the key element linking the landed elite with authoritarian anti-democratic politics. The use of extra-economic coercion in slavery, serfdom, or other forms of forced labor requires a powerful authoritarian state and precludes extension of citizenship or other legal rights to the working population.” However, it’s worth noting the obvious fact that an authoritarian state can be very useful to industry also, and that for such a state to exist there need not be a dominant landed elite. For instance, a foreign country such as the U.S. can prop it up through military aid.

Interesting comments:

As James Dunkerly has pointed out, the transition to democracy takes on a very different form in Central America than in the Southern Cone of Latin America (Argentina, Uruguay, Chile) and other semi-peripheral regions that have become the model for theorizing about the current wave of “transitions to democracy.” In the Southern Cone model of “democracy by default,” the exhaustion of state-centered import-substitution industrialization, compounded by the debt crisis of the 1980s, led to a loss of foreign and domestic business support and subsequent voluntary withdrawal of the military from rule after it had disarticulated the left through political repression. In Central America, state-centered import-substitution industrialization was not the dominant pattern except in an attenuated form in Costa Rica.... The praetorian military dictatorships of Central America have little in common with the “bureaucratic authoritarianism” of the military regimes of the Southern Cone, and the Central American militaries, to put it mildly, did not leave voluntarily....

As Gay Seidman has demonstrated in a comparative study of Brazil and South Africa, parallel processes [to Central America’s] were at work in more developed societies. The success of import-substitution industrialization strategies in semi-peripheral authoritarian regimes such as Brazil and South Africa in the post-World War II era created new social movements that could not be contained within these regimes. The creation of a vastly expanded industrial working class on the one hand, and a vast impoverished urban

¹ One should note, however, that it won’t be an *inclusive* democracy until the lower classes force it to be.

informal sector on the other, both consequences of successful industrialization without redistribution, created the conditions for what she calls “social movement unionism.”... Critical for the success of social movement unionism was a split between the industrial elite and the state as the world economy entered its downturn after 1973. Given a choice between strengthening the authoritarian state apparatus sufficiently to repress the workers’ movements and making an accommodation with them, the new industrial bourgeoisie abandoned its allies in the military, opening the way for democratic regimes in both South Africa and Brazil.

This is sort of what happened in Central America. In both cases, “popular mobilization split the more progressive sector of the bourgeoisie off from its authoritarian allies.” The class structures and the agents of the transition were somewhat different, but the outcomes were similar.

*

Here’s a simple way to think about the downfall of capitalism: for over a century, oppressed people all over the world have risen up again and again, year after year, decade after decade, to overthrow institutions either integral to or, if residual from the feudal past, temporarily strengthened or made harsher by capitalism. And people will continue to do so, each generation continuing the fight. Their prospects for revolutionary success, however, have been limited as long as the core of capitalism in the West has had a fairly stable social structure and intact civil society. As long as the richest states have not faced insurrections themselves but have been able to intervene (usually successfully) whenever such insurrections threatened elsewhere, global capitalism has been more or less safe. Only when, finally, insurrections elsewhere coincide with massive revolutionary movements in the core—resulting in part from the decline of an integral civil society—can capitalism fall. This condition wasn’t really fulfilled even in the 1930s. Only now is it beginning to come to fruition.

Moreover, the necessity that civil society decay means that capitalism’s fall has to coincide with that of the nation-state, which, historically speaking, matured symbiotically with civil society. The latter’s decline entails the former’s.

*

In a sense, yes, nature was unjust in having made women subordinate to men¹—in much the same ways as children are, though not to the same extent. Physical weakness, shorter and smaller bodies, the need and desire to be protected, a lower degree of assertiveness and self-certainty (on average), the tendency to have a more “receptive,” impressionable, excitable nature, etc. All the old stereotypes. On the other hand, there are compensations, to quote Emerson. Women naturally derive many benefits from their so-called weaknesses, and those weaknesses certainly don’t make them unhappy. If anything, women tend to be more joyful, life-loving, and innocently fun-loving than men. (Just as children do.) Only malcontented *ressentiment*-charged radical feminists are made unhappy by the *natural* side of their subordination to men,² and here the unhappiness is caused mostly by social factors, not genes. When it comes to the things that really matter, such as the capacity for happiness, moral behavior, intelligence, creativity and self-expression, *humanity*, women are far from inferior.

*

¹ (Notice I didn’t say inferior. That would be meaningless and stupid.)

² Obviously there are also “unnatural” kinds of subordination, unnecessary kinds, which should be abolished. I’m thinking, for example, of political and economic subordination.

There is something low and vulgar about picking up women, talking to them and flirting with them in order to get their phone numbers. Saying what you have to say, saying what you think will entertain them, trying to make them laugh, lying and flattering and teasing in order to elicit giggles, *descending* in that way. Women tend to like it, of course, but it's still low and vulgar. Frivolous, and undignified for both parties.¹

*

There's no question that the vast majority of pornography is degrading to women. What is disturbing is that the vast majority of people enjoy watching it.

*

The prehistoric understanding of words as possessing magical power, as being means of conjuring gods and controlling nature, has analogues all through history. For example, as Benedict Anderson notes, Church Latin, Koranic Arabic, and Examination Chinese were for a long time seen by their respective cultures as "truth-languages," direct emanations of the divine. Essentially untranslatable, each the only medium through which reality could be apprehended. So, instead of being a tool for controlling the world, language—a particular language—was now only an expression of it, of the world's innermost essence. One could no longer communicate with gods and influence them; one could only seek to understand them (or reality, the cosmos), by learning the divine language. This was a step towards the "disenchantment" of the world (as Weber would say), i.e. the self's separation from essential reality, its alienation, its understanding of reality as *transcendent* instead of immanent [which it had been in the age of animism]. With modernity came the final step, when the divorce between language and the world, thought and being, became absolute. Linguistic signs are now seen as arbitrary, in no way emanations of reality but rather "randomly fabricated representations of it."

With postmodernism, though, it would seem that there has been an ironic—and ironically unconscious—return to the more naïve attitude. The separation between thought and being, or "discourse" and the world-in-itself, has been repudiated, so that the world is now constructed by discourses, "signifiers," "significations," etc. Actually no return to an earlier stage has happened; instead, alienation has been taken to an extreme: reality itself has been sloughed off, discarded, denied. There is no reality; there is only the play of subjectivities and significations. Truth, God, whatever, is so "transcendent" it doesn't even exist! There is no anchor, only ethereal discourse. What can come after this stage? Presumably either the end of the world or some sort of negation of the negation.

*

It's all illusion. All of it. And I don't have a stake in the outcome. —Let things fall apart, let chaos reign, let this ugly world fall to pieces.

*

Believe it or not, I don't have very high standards for people. A woman who emails me after reading my profile on a dating website impresses me. An academic who expresses appreciation for Noam Chomsky really impresses me. Someone who regularly replies to emails impresses me. I'm impressed by people who love classical music. The problem is that almost everyone is predictable, so these things rarely happen.

¹ [That's only from one perspective, though. From another, a more good-humored perspective, it's perfectly fine and natural to hit on women and so forth. It's just good spontaneous fun. When I wrote the above I was thinking of those awkward situations in bars or elsewhere when you approach women with the intent of getting their phone numbers and are forced to make an ass of yourself.]

*

On the “law” of comparative advantage.— According to Adam Smith, “were the Americans, either by combination or by any other sort of violence, to stop the importation of European manufactures, and, by thus giving a monopoly to such of their own countrymen as could manufacture the like goods, divert any considerable part of their capital into this employment, they would retard instead of accelerating the further increase in the value of their annual produce, and would obstruct instead of promoting the progress of their country towards real wealth and greatness. This would be still more the case were they to attempt, in the same manner, to monopolize to themselves their whole exportation trade.” Chomsky comments: “Surely among the most spectacularly refuted predictions in economic history, but solidly based in the abstract theories that continue to be imposed on the weak.” We’re lucky that Alexander Hamilton ignored classical economics—as has every country that has ever industrialized.

*

To reiterate ideas from months ago: as I see it, there have been two [or one-and-a-half] global “cycles” in the history of industrial capitalism. In the first, Britain industrialized, then adopted free trade because it really had no competitors to fear, and then imperialism happened (protected markets, etc.) when other countries caught up. International overproduction became problematic, and underconsumption in domestic economies persisted until finally it got severe in the U.S. (and elsewhere?) and helped cause the Great Depression. More protectionism, nationalism, and World War II. Afterwards the U.S. was in something like the hegemonic position of Britain in the mid-nineteenth century, so it adopted free trade because of relatively little danger from European competition. But by the 1970s international competition had reached the danger zone again and global overproduction returned. Hence lower profit-margins and more protectionism, especially, from what I remember, in the 1980s. (But less protectionism than early in the twentieth century—which probably has contributed to the even greater recent predominance of financial speculation than in the 1920s and earlier.¹) A return to severe underconsumption, financial bubbles, and crises. The question is, what next? A global depression, but then what? Evolution towards socialism? Either that or the collapse of everything. (Or both.)

*

The notion of “stupidity” seems purely polemical and without substance, but that’s wrong. It is a necessary concept in order to explain things about people that would otherwise be inexplicable. Lack of critical intelligence, lack of talent for abstract thinking, lack of social awareness or understanding of people and situations—these are what is usually meant by “stupidity.” Everyone exhibits stupidity sometimes, but in some people it is more common than others. A disproportionate number of political conservatives, for example, are more or less stupid, as you’ll see if you talk to them. They have trouble understanding arguments; they’re less open-minded than liberals tend to be, less able to understand opposing arguments or consider facts disinterestedly. Scientific research, by the way, confirms this. I suspect it has something to do with the old idea of the authoritarian personality (which exhibits more stupidity than a relatively “open” personality does). Another way to say it is that the average conservative is less objective, rational, open to logic, empathetic, etc. than the average liberal. That’s a scientific fact, not just an insult.

¹ In other words, with fewer protected markets than earlier—and no colonies to supply raw materials cheaply and serve as protected markets—manufacturing has become relatively less profitable than in the early twentieth century and finance correspondingly more so. (It’s interesting that the interests of finance (speculation, etc.) and manufacturing are so often opposed. Manufacturers tend to profit from more protection but “financiers” from less, partly, I suppose, because financial capital is more mobile than manufacturing.) But I’m still too ignorant to talk about this stuff.

As for radical leftists, they often fall into one of two categories: the left version of arch-conservatives with whom you can't argue, and something that approximates the open-mindedness and intellectual disinterestedness of Chomsky or Zinn. Mainstream liberals tend to be more objective than the former but less objective than the latter.

*

I dance, therefore I am.— A piece that's good for restoring the love of living after you've been corrupted by contact with authority is Beethoven's King Stephen Overture. It's joy in fun and fun in joy. Enjoy! :-)

*

Men's attraction to women in their twenties is a kind of socially acceptable pedophilia.

*

The movie *Der Untergang*, about Hitler's last days, dramatizes divine retribution. Nazism happened in Germany, and then Germany was destroyed. A grievous chastisement rained down from the sky. The most horrifying thing in history could not be without consequences for its perpetrators. Nazism in its essence was an implosion of everything true, good, and beautiful; its logical conclusion was World War II, and logically its conclusion had to boomerang back to its true believers. When you watch the scenes of bombs pulverizing Berlin and think of Dresden's destruction, you realize that that was all implicit in Nazism itself. The ideology was fulfilled. Nazism, as a negation of moral and intellectual culture, was *precisely* what happened to Germany [and all Europe]; in that sense, it ended as the most fully realized ideology in history.

This combination of perfect racism, perfect nationalism, perfect anti-intellectualism, perfect Social Darwinism, perfect authoritarianism, perfect bureaucratism, and perfect militarism amounted to perfect nihilism, and thus *was* what it both *deserved* and *received*: perfect negation. It was also the culmination of the dark side of Western history (which continues, however). Maybe, after all, it was inevitable that someday there would come to power a fusion of imperialism, nationalist and racist hatred, and ultra-bureaucratism—all on that most explosive and authoritarian of foundations, industrial capitalism. Maybe Europe just had to get it out of its system, at least temporarily purge itself. The transition from a feudal and absolutist social order to a mature capitalist and liberal democratic one was never going to be easy.¹ Is the stage of world-conquering nihilism going to happen again as we progress from capitalism to post-capitalism? Let's hope not.

*

Classical and neoclassical economics are silly. Maybe at times they stumble into a good idea or two, but the foundation is unreal. Let's just use our common sense for a minute. If a country wants economic development, there has to be demand for goods. Without demand, producers will have no reason to supply goods. What's the most effective way to create demand? Let government use its enormous tax revenues to directly demand products and services (infrastructure development, etc.), to redistribute income to those who will use it to buy the most stuff, and to fund and direct public institutions that will contribute to

¹ [I hear a postmodern intellectual shouting at me, "Teleology! Determinism! Etc.!" But all I'm saying is that, in retrospect, it is liberal democracy that best (most stably and so on) reconciles the demands of capital with those of most of the populace. So it was highly probable that as capitalism grew older, liberal democratic tendencies would finally prevail—as they have recently done even in Latin America. Even where they haven't prevailed, though, there are long-term pressures in that direction. They might not be realized, but they exist.]

development. For these reasons alone, government has to be the foundation of modern economic progress. But it is also needed in the sphere of foreign trade, to establish import tariffs and quotas. After all, development is based on continual improvements in labor productivity. (With more productive labor, output can be greater and cheaper, which brings in more revenue that makes it possible to hire more workers and/or pay them more, which both raises effective demand and gives business incentives to raise productivity more, etc. It's a virtuous circle.) Government therefore should use its unequalled revenues and power to direct investment—or encourage it to be directed—where there is the greatest potential for improvements in labor productivity. This might well necessitate tariffs and quotas, to give domestic business a chance to catch up with international competitors.

The world is more complicated than all this, yes. Especially the world of late globalization. Nevertheless, the principles are accurate, as history proves. The problem is that in a capitalist world, contradictions inevitably creep in and muck up even successful instances of development. Nothing is sustainable in a capitalist world.

*

In *Chomsky: Ideas and Ideals* (2004), Neil Smith says the following: “The part of his work for which [Chomsky] is most famous, infamous according to some, and the one for which he has been most vociferously criticized, is his argument that a substantial part of the faculty of language is genetically determined: it ‘is some kind of expression of the genes.’ [Horror of horrors!] The simplest formulation of this claim, which recalls the rationalism of Descartes, and explicitly juxtaposes this with the empiricism of Quine, is that ‘Language is innate.’ The claim is so radical [?], and so counterintuitive in the face of the existence of close on 10,000 different languages in the world, that it is necessary to summarize and evaluate the evidence.... [The evidence Chomsky cites includes] the speed and age-dependence of acquisition, convergence among grammars, analogies to vision and other modular abilities, species-specificity, the ‘over-determination’ of language acquisition in deaf or blind, or deaf-blind, children, but above all the existence of universals on the one hand and poverty-of-the-stimulus arguments on the other.”

It's just astounding. Academics actually consider these ideas controversial, even “radical”! Why is there such aversion to the clearest common sense?? The average person on the street, who would surely agree with Chomsky, has a more sensible head on his shoulders than these professional intellectuals, these lunatics. Why the aversion to innateness?? Why the centuries-long commitment to empiricism?? Why the ridiculing of the idea that the human mind inherently has limited cognitive capacities?? Every other species does, so why not us? We're not angels, to quote Chomsky; we're defined, determined, organic beings, whose minds are not blank or infinite at birth. From my teenage years, or before, I've implicitly considered these rationalist ideas too obvious to discuss. But I guess humans don't like to believe there are limitations to their powers or freedom or ability to mold themselves and understand everything. Childish delusions, residues of infantile narcissism.

*

Dissertation stuff.— Email to the labor historian Alex Lichtenstein: “Professor Lichtenstein— I'm a graduate student in History at UIC, [...]. I found your article "A 'Labor History' of Mass Incarceration" quite useful as I plan my dissertation—but I'm still in the very early stages of the project, which is why I'm emailing you. I'm fascinated by the "prison-industrial complex" of recent decades, in particular by its surely great contribution to the "decline of America" that is occurring, this world-historic development. I'd like to study something to do with this, but I'm having trouble formulating a specific research program. I can't help thinking that the emergence of the "national-security state" is intimately tied to that of the "carceral state," that the two are but different facets of basically the same phenomenon—the same decline of civil society, privatization of public space, decline of the welfare state, all of which is clearly tied to deindustrialization, the rise of global finance, the war on drugs and on labor.... These developments all seem interrelated—though exactly *how* they're related is difficult to explain—and I suspect that they also are contributing to

the evolving global crisis of capitalism, for instance insofar as they stifle aggregate demand, which according to many economists is a fundamental reason for the explosion of consumer and government debt in recent decades. I'm fascinated by the ways in which all these symptoms of crisis seem indirectly to imply each other, to "holistically" bring each other about. And this carceral, national-security state that is being born—it strikes me as symptomatic of the crisis of the nation-state itself, as though perhaps, in the long run, it will prove to have been the final or penultimate stage of the (Western) state's 700-year-long evolution....

“So I guess I'm most interested in the big picture. Something having to do with the decay of the world center of capitalism—and thus, perhaps, the decay of capitalism itself—as viewed through the prism of the carceral state. Or of the rise of such a state as it has interacted with, and partially determined, the decline of the welfare state. But specifically how to approach the issue is stumping me. Do you have any ideas? This statement of yours intrigued me: "...In short, labor historians are positioned to ask how what Simon calls “governing through crime” has been linked to the emergence of a particular kind of political economy—one associated with the Sunbelt (California and Texas in particular), lack of regulation, the privatization of social space, antitax politics, erosion of state expenditures on public goods (education, services, etc.), yet (at least until very recently) apparently limitless public expenditure on corrections driven by fear, anxiety, and post-civil rights racial backlash. What does the new carceral state look like as a functioning political-economic system, and how did it evolve to its currently unsustainable point?” Excellent questions. I've been considering studying state governments' spending since the 1970s on carceral/security vs. "welfare" measures and how/why the proportions have changed. Or maybe it would be more interesting to study corporate lobbying pertaining to incarceration, surveillance, etc. A scholarly investigation of the American Legislative Exchange Council or some such organization might be fruitful. Or maybe I could study the evolution of a particular city (say, Chicago? or some other city in the Midwest?) from the perspective of the carceral/security state's rise. Do you think that might be worth doing?

“Anyway, I'd appreciate any suggestions, if you have time. I'd like to do something that's important but also manageable.... Having difficulty thinking of what that might be, as you can tell.”

He sent a few suggestions, but I'm still struggling.

*

A romantic like me sometimes finds it hard to motivate himself to do things if he doesn't have a “soulmate” to inspire him. A beautiful woman he deeply loves and respects, a woman who challenges him to achieve his potential. He might lose interest in things or not take anything very seriously because unconsciously his mind is not at one with itself. He will possibly fixate on the pointlessness and unhappiness of everything, projecting his dissipated thoughts and energies into universal truths. If he has great inner strength he might survive and even accomplish many things, but it will all be rather hard and he'll feel deeply lonely. He'll talk to wonderful women like Marilyn Smith with a mild pain in his chest knowing that she's married and wouldn't be interested in him anyway, and he'll try to forget about her.

*

The state of our society and its trajectory since the 1930s are revealed in a simple juxtaposition: in the 1930s the government's message was “We have nothing to fear but fear itself”; nowadays the message is “We have nothing to fear but a lack of fear itself.”

*

I don't like to sound negative, but I have to admit that you can *sort of* judge the “value” of a person by the quality of people with whom he or she chooses to interact. For example, I can't help thinking that there is something pathetic about a woman who wants to be my roommate's girlfriend. Even if she seems like a great person, you know there's *something* wrong with her. In general, you see these women fawning

over idiots and jerks, and it's hard not to judge them. A person chooses to be with people who reflect some aspect of him, who either complement him or share his qualities—i.e., who confirm his self-love, with whom he identifies in some way. So it's perfectly permissible to “judge” someone, at least a *little*, on the basis of his friends or lovers, since they are effectively reflections of him. They give clues to his character.

*

Here's an email exchange with Chomsky: “I'm curious what you think about vegetarianism/veganism. I'm not a vegetarian—I like meat too much—but maybe I should become one.... Do you think there's a moral imperative to justify one's decision to eat meat (considering the conditions of industrial production, etc.)? Or do you think that because choosing not to eat meat wouldn't do anything to improve conditions in the food industry, it isn't really a 'moral' decision at all? How do you justify not being a vegetarian?” “It's a moral issue, one of many. And there are conflicting values, as usual the case in life [sic]. Vegetarian or not, one should seek to improve conditions in the industry. On justifying actions, hard to imagine anyone who doesn't face that question. Take a vegan who doesn't grow his/her own food. How do they justify the waste of energy transporting it? The waste of time that could be used for helping people in need (it does take time, planning, etc.) and on and on.”

*

In my Master's thesis I argued that in the coming decades, the state and the ruling class, in order to partly contain popular discontent and so prop up their power, will probably have to evolve in ways that will undermine their position in the long run. I ought to have noted that neoliberalism itself—the state's configuration in the past thirty-five years—has evinced similar dynamics. It has been the means by which the ruling class has maintained and even augmented its power after the popular uprisings of the 1960s and 1970s, but ultimately it will prove—or is proving—to have made the long-term position of the ruling class untenable. It has so undermined social stability that I suspect power-structures all over the world are panicking now. In the last twenty years there has been a militarizing of police forces and an expansion of the national security state in order to control the population, and these trends are intensifying. But they're not going to prove sufficient. As the global economy falls apart and privatization continues, the ruling class will, I think, have to start tolerating and maybe even encouraging the kinds of decentralized grassroots initiatives I discussed in the thesis, because they'll seem less subversive towards power than mass political movements. Thus, the rich and their state will advance to another stage of the dialectic, another stage of their self-undermining, in which they participate more actively—out of necessity—in destroying the conditions of their rule. The “necessity” of this stage, if it occurs, will have organically emerged from the previous neoliberal phase, which itself grew out of the unsustainability of the earlier, more “populist” phase (the heyday of the welfare state), and so on back to the beginning.

A few weeks ago I joined the six-person bargaining committee of the Graduate Employee Organization. (New contract negotiations are coming up.) The stuff is tedious and I'm bad at it, but I might as well get involved in something. [...]

End-of-the-semester papers:

The Tortured Demise of the Nation-State

In the age of advanced globalization, it is common for intellectuals to argue that the nation-state is in decline. David Held, for example, who distinguishes between a state's autonomy and its sovereignty, contends that international organizations such as the European Union, NATO, and the World Bank both limit states' autonomy and infringe upon their sovereignty.¹ Edward Said, on the other hand, observes that a "generalized condition of homelessness" characterizes contemporary life.² One could embellish this insight by pointing to the *social atomization* that seems to be ever more pronounced in much of the world, and that vitiates the *rootedness* of truly belonging to a national community. It appears, therefore, that the nation-state is under assault on more than one front. In this paper I will argue that that is indeed the case; I will also clarify some of the processes at work.

It is necessary, first of all, to define the nation-state. Anthony Smith gives a reasonable definition of the fully formed nation in saying that it is "a named community of history and culture, possessing a unified territory, economy, mass education system and common legal rights."³ The term "nation-state," then, makes explicit the fusion of such a community with its own government that administers and regulates the social order. On this understanding, nation-states are a modern creation: history is full of empires, city-states, tribes, and nomadic groups, but before the late nineteenth century there were no full-fledged nations or nation-states. To say they are purely a modern "invention," however, or an elite construct with no basis in historical reality—as some scholars imply—is to go too far. Smith is right that the nation has historical antecedents. Both the ancient and medieval eras boasted "durable cultural communities," ethnic communities with common historical memories, homelands, languages, religions, and a sense of solidarity.⁴ Some of these not-always-well-defined communities eventually formed the basis of particular nationalities.

Benedict Anderson is right to emphasize *print-capitalism* as having made national consciousness possible by creating "unified fields of exchange and communication below Latin and above the spoken vernaculars."⁵ In the centuries after Gutenberg's invention, print-capitalism spread across the continent, "assembling" related vernaculars by creating "mechanically reproduced print-languages capable of dissemination through the market."⁶ Speakers of the many varieties of French, for example, could now understand one another through print. Literacy increased as writing became more accessible. Print-capitalism also gave a new "fixity" to language by encouraging the standardization of spelling and syntax. Third, Anderson notes that print-languages inevitably exalted certain dialects at the expense of others: High German and the King's English, for instance, eventually became languages of power, causing other dialects to atrophy and sometimes to die out. These processes fostered linguistic uniformity, which contributed to the rise of national consciousness.

In fact, without print-capitalism it is hard to imagine most of the things that are thought to have facilitated the emergence of the nation-state. The Reformation was made possible by print, as was the Scientific Revolution, the Enlightenment, the spread of such ideologies as liberalism and republicanism, thereby the French Revolution, industrialism, the immense bureaucracy of the modern state, mass education, etc. Similarly, the large-scale state projects undertaken in the heyday of the nation-state would have been impossible without print. One might consider the history of the state to have climaxed in these projects that exemplify what James C. Scott calls the "high modernist" ambition for the "administrative ordering of nature and society," with which such figures as Le Corbusier, Stalin, Robert Moses, and Robert McNamara are associated.⁷ Soviet collectivization is an example, as is the construction of Brasília between

1956 and 1960. Similar projects are still going on today—though not, it seems, in North America or Europe—as for example China’s relocating of hundreds of millions of peasants into newly constructed cities such as Chongqing.¹

Considering the importance of print-capitalism as a foundation for the rise of the nation-state, it is ironic that what one might call *electronic capitalism* is contributing to the *decline* of the nation.² Here, however, we must distinguish between the nation as an “imagined community” and the state, the government apparatus. The former is declining faster than the latter.³ Already with the spread of television in the 1950s and 1960s, the atomizing potential of electronic media was becoming apparent. In a sense, television gave and continues to give people common cultural touchstones, shows they can watch and discuss, advertisements they can all relate to, news items, ubiquitous soundbites, etc. More fundamentally, however, television has fragmented communities and families, atomized the national culture, instilled mental and behavioral patterns of *passiveness*, and in the long run degraded civil society. Lauren Berlant is right that “television promotes the annihilation of memory and, in particular, of historical knowledge and political self-understanding.”⁴ Print media have a tendency to encourage dialogue and reify culture, to bring people together to participate in a broader community, ultimately a national one; electronic media—in the context of capitalism, at least—tend to substitute isolation and self-involvement for direct interaction with others, as well as to degrade communication into instantaneous visual and auditory stimuli whose effect is to undermine identities (be they personal, national, or whatever).

These trends are even more evident when one considers the impact of video games, cell-phones, computers, the internet, and such “social media” outlets as Twitter and Facebook. A society in which most people spend an inordinate amount of their time sitting in front of TVs, playing video games, shopping online, searching for soulmates through internet dating, imbibing bits of information in short bursts from an endless variety of global news and entertainment sources, and electronically “chatting” with acquaintances or strangers located anywhere from the next room to the other side of the world—such a society does not have much of a tangible national culture, and its “imagined community” is indeed *imaginary*, a mere abstraction with little basis in concrete reality. In short, the individualistic, passive, and *consumerist* nature of a capitalist society saturated by electronic media⁵ is interpersonally alienating and destructive of civil society, hence destructive of a shared national consciousness.

At the same time, because electronic technology makes possible nearly instantaneous communication across the world, the kind of community it fosters is global rather than national. One may start to feel more affinity for people ten thousand miles away than for one’s compatriots. Global social movements become easier to coordinate; things like the Arab Spring and Occupy Wall Street can emerge to break down national barriers and birth a *global* consciousness.

Electronic capitalism has also helped make possible the hegemony of transnational corporations, which have their own role to play in the destruction of the nation. First and foremost, their actions tend to bring about the equalization of conditions between countries. As corporations seek cheap labor abroad, impose ever-poorer working conditions on domestic employees, deindustrialize Western countries in part by obsessively pursuing productivity advances that make possible shrinking workforces, and fight to dismantle economic regulations and the welfare state, they cause a creeping Third-Worldization of the core capitalist countries—while facilitating a creeping industrialization of the former Third World. The point is not that the Global South will ever achieve anything like the once-prosperous level of the North; rather, it is that the world is heading towards a relative convergence of social conditions everywhere, in the form of

⁵ And by “print versions” of such media, for example magazines devoted to celebrity gossip and instant gratification of whatever sort.

extreme economic inequality, political disenfranchisement of the majority, environmental degradation, and so forth. In the West especially, class polarization is increasing and infrastructure deteriorating. National differences thereby become of less substance; the urgent task appears of *globally* confronting power-structures, since it is only on the global stage that transnational corporations can potentially be defeated. (After all, they can play off country against country in their quest for advantageous regulatory regimes.) The slogan “Workers [i.e. non-capitalists] of the World, Unite!” becomes more timely than ever before, since nation-states *really are*, this time, deteriorating from within and from without.

Like the national community, though less obviously, the state—particularly in the core capitalist countries—is under assault. As David Held says, it is slowly losing its autonomy and sovereignty to international organizations, and increasingly it has to coordinate its policies with other states. As it grows ever more debt-encumbered and beholden to corporate entities,¹ it begins to lose its ability to administer the social order, which itself is becoming less governable and more unstable as the population increases, class polarization intensifies, and infrastructure decays. The predictable consequence is that a quasi-police state will take the place of the welfare state—as is indeed happening, with heightened government investment in the “national security” state, in powers of surveillance, the expansion and privatization of prisons, the militarizing of police forces,² the ever-more-frequent suspension of civil liberties, etc. From one perspective, such developments *heighten* the power of the state; seen in their true light, however, they are symptoms of a social and political crisis. Far from indicating the health of the state, they show its sickness. In the long run they may prove to be its death-throes.

Said differently, the Western state is ceasing to be the *public* state it once was; it is becoming a government explicitly for the rich, a “private” state, a “security” state. More and more of its functions are privatized, including education, national security, law enforcement, and administration of prisons. The repressive functions of government—some of them taken over by outside contractors—become more important as the citizen-empowering, civil-society-enhancing functions start to wither away. Again, this is all in the interest³ of “The Corporation,” which can accumulate more capital and power as citizens lose their capacity to resist.

No doubt reactionary nationalist movements will appear, in fact are appearing, as these crises deepen. Their significance, however, is precisely the death of the nation-state, not its resurgence. David Held is right that the world is simply too interconnected now, and transnational corporations have too much power, for a return to the era of sovereign and autonomous nations to occur. Xenophobia and nationalism are vomited up with the drawn-out death-rattles of the Western state, as conservative sections of the public take up arms against the implications of corporate globalization.

The impact of all this on capitalism itself is another interesting question. Suffice it to say that, just as capitalism and the nation-state matured symbiotically together, so they will probably meet their demise in a fatal embrace. As capitalism evolved from its primitive commercial character in the fourteenth and fifteenth centuries to a more mature mercantilism and proto-industrialism, thence to full industrialization in the nineteenth century, finally from this phase of so-called “competitive capitalism” to “monopoly” or “state” capitalism in the twentieth century, the nation-state evolved from its primitive beginnings in the late feudal era to its apotheosis between the 1930s and 1960s in the “high modernist” schemes that James Scott discusses.⁴ Capitalism’s evolution made possible that of the nation-state, and the latter’s evolution made possible the former’s.⁵ Capitalism’s continued maturation, however, in the form of advanced globalization, has, as we have seen, begun to undermine the nation-state, a process that in the long run cannot but undermine capitalism itself. For the latter has, at least since the 1500s, required a state to maintain order

¹ For the reasons behind these developments, see Robert Brenner, *The Economics of Global Turbulence: The Advanced Capitalist Economies from Long Boom to Long Downturn, 1945-2005* (New York: Verso, 2006).

and facilitate the accumulation of capital. As the state loses its capacity to keep order, and as people across the world unite to resist the depredations of The Corporation, capital accumulation will face ever more obstacles.¹ In the end, one can expect the current world order to implode; some sort of post-capitalist, post-statist order will rise from its ashes. What it will look like, no one can foresee.

Dependency Theory Reconsidered

Forty-three years after its publication, Andre Gunder Frank's *Capitalism and Underdevelopment in Latin America: Historical Studies of Chile and Brazil* (1969) is still worth reading. It combines a compelling exposition of dependency theory with a wealth of factual information about Latin American history that even readers who disagree with Frank's theoretical premises will find of interest. Of course the most notable parts of the book, though, are its theoretical interpretations, which have aroused controversy since their publication. Frank is not the sole founder of the dependency school, which has a lot in common with Immanuel Wallerstein's world-systems theory; nevertheless, he is a particularly important proponent of the model, and his arguments are at times very convincing. In this paper I will summarize some of his ideas, give a critique of them, and explore whether they are still relevant.

Frank states his overarching thesis and its presuppositions as follows:

This essay contends that underdevelopment...is the necessary product of...capitalist development and of the internal contradictions of capitalism itself. These contradictions are the expropriation of economic surplus from the many and its appropriation by the few, the polarization of the capitalist system into metropolitan center and peripheral satellites, and the continuity of the fundamental structure of the capitalist system throughout the history of its expansion and transformation, due to the persistence or re-creation of these contradictions everywhere and at all times. My thesis is that these capitalist contradictions and the historical development of the capitalist system have generated underdevelopment in the peripheral satellites whose economic surplus was expropriated, while generating economic development in the metropolitan centers which appropriate that surplus—and, further, that this process still continues.²

The terms “metropolis” and “satellite” do not refer only to countries. According to Frank, their instantiations appear at all levels of the capitalist system, from the international to the intra-firm. For example, for most or all of its history Brazil could be considered a satellite of the world metropolis Britain (or London) or, later, the U.S. (or New York City); São Paulo, however, was and is the national metropolis that appropriates surplus from more underdeveloped regions of Brazil; within these regions are large towns that appropriate surplus from smaller ones and the countryside; on the level of the enterprise, too, the owner can be considered the “metropolis” who extracts surplus from, and thereby underdevelops, his “satellites” the workers, who are dependent on him as Brazil used to be utterly dependent on the U.S. The entire world is enmeshed in a billion webs of these metropolis-satellite dependency relations. The only difference between, say, a national metropolis like São Paulo and a world metropolis like New York is that the former is a satellite of the latter, and is therefore underdeveloped in relation to it.

Frank suggests that a metropolis has various mechanisms by which to keep its satellites in their dependent state and continue extracting their surplus, among them brute force (military or police), the enforcement of tariff policies (in the case of international relations) that benefit the metropole, the possible existence of powerful groups in the satellite whose interest lies in maintaining the status quo, and so forth. Underlying all these mechanisms, however, is the fact that the metropolis has so-called monopoly power

¹ David Harvey, *The Enigma of Capital* (New York: Oxford University Press, 2011) discusses these obstacles in detail.

² Andre Gunder Frank, *Capitalism and Underdevelopment in Latin America: Historical Studies of Chile and Brazil* (New York: Monthly Review Press, 1969), 3.

over the satellite, due to its already-established access to greater resources and possession of more economic surplus (which it then uses to extract even more). Once a country is already in a dependent relationship with another, Frank thinks it is impossible for it to break out of that underdevelopment-generating relationship unless it separates itself from the world capitalist system as a whole, in the manner of Communist Russia and China. The only possible solution, in other words, is a “socialist” revolution. The reason, it seems, is that, because the development of some places and the underdevelopment of others is an essential feature of capitalism, for a country to try to escape from a state of dependency by pursuing a “different kind” of capitalism than in the past—a more “independent” kind—is hopeless.

It is not difficult to criticize these ideas, however suggestive they may be. They are so abstract that their explanatory value is not clear. The metropolis/satellite opposition, while presented as a kind of explanation, is little more than a metaphorical description, albeit a suggestive and useful one. However, to compare the relationship between an employer and his employees with that between the global North and the South seems more confusing than helpful. In certain contexts, to invoke a metropolis/satellite relation can be useful as a way to guide one’s analysis; ultimately, though, it is the details of the analysis that matter, the *mechanisms* by which surplus is transferred from one entity to another.

The notion of surplus itself is obscure. Frank takes much of his theoretical framework from Paul Baran, who, in *The Political Economy of Growth* (1957), distinguished between actual and potential economic surplus, both of which are different from Marx’s concept of surplus-value. Given Frank’s cavalier attitude toward theoretical underpinnings—his rather naïve use of the notion of surplus without investigating it rigorously—it is easy for the reader to be confused as to what exactly “surplus” means. Can it be measured? How is it determined? What is the relation between Marx’s surplus-value and Frank’s “surplus”? Is it even theoretically possible to determine how much surplus is extracted from a particular satellite? Despite all these problems, some kind of conception of surplus, of a difference between total output and the portion of it that is directly consumed, seems useful. Baran’s and Frank’s point is, first, that in addition to consumption there is savings or accumulation—the “actual” surplus—“which finds its embodiment in assets of various kinds added to society’s wealth...[including] productive facilities, inventories, foreign balances, and gold hoards.”¹ Second, much of the surplus from so-called satellite regions is siphoned to the metropolis, where it contributes to economic development; moreover, because consumption in satellites is often pushed down to subsistence levels, the surplus there, most of which goes to the metropolis, is large relative to total output.² Intuitively these ideas seem plausible. What they amount to, after all, is simply that global centers of industrial capitalism have historically extracted a great deal of wealth from more “backward” areas (thereby helping to keep the latter backward)—which is a fact that Frank amply documents in his book.

In other words, the central intuition of dependency theory, expressed in the previous sentence, is perfectly defensible, in fact almost certainly true. The problems with the theory, at least as Frank propounds it, are in its theoretical framework (or lack thereof) for that intuition. Baran, Frank, and others are right to emphasize tariff policies, foreign direct investment, foreign lending at high interest rates, and old-fashioned gunboat diplomacy as mechanisms to ensure the North’s extraction of wealth from the South—mechanisms that have, perhaps, been made possible by the dominance in the South of landowning and merchant classes whose interests have tended to align with those of foreign capital—but Frank’s hypotheses in particular are under-theorized and over-abstract. He effectively equates capitalism with the market, arguing that the fact that satellites are integrated into a world market in itself makes them completely capitalist. Their only possible salvation, therefore, is to withdraw from the international market and become “socialist.” Robert Brenner counters by arguing that the necessary condition for modern cumulative development at a compound rate is that a country have a capitalist *class structure*, a structure relatively polarized between owners of capital and “free” wage laborers owning no means of production. Such a structure was largely absent in most of Latin America until recently; this fact, to which Frank apparently attributes little

¹ Quotation from Baran in Charles A. Barone, *Marxist Thought on Imperialism: Survey and Critique* (New York: M. E. Sharpe, Inc., 1985), 60.

² *Ibid.*, 88.

importance, was a major determinant—and manifestation—of the continent’s underdevelopment.¹ “Socialism,” therefore, is not the only possible salvation; politically sponsored industrial capitalism, such as exists in South Korea, Taiwan, Singapore, and recently parts of Latin America, is equally a possibility. The point is that Frank’s emphasis on the international market and his relative inattention to production relations and class structures limits the explanatory power of his ideas, makes his analysis excessively “abstract” and “fatalist” (in that any country that has at one point been underdeveloped is supposed to be incapable of developing without totally withdrawing from the capitalist market), and leads him to incorrect conclusions about policy and revolutionary strategy.

The central contention of dependency theory, however, remains relevant even today. The North continues to expropriate wealth, or surplus, from the South, thus contributing to the latter’s underdevelopment. A particularly effective way of doing so, as Walden Bello argues in *The Food Wars* (2009), has been through structural adjustment programs imposed on developing states by the IMF and the World Bank. By conditioning loans on a country’s privatization of its economy, dismantling of its public sector, suppressing of labor unions, and opening up of its economy to international competition—all of which are designed to enable the country to pay off its existing debt—the IMF has facilitated the plundering of states’ wealth for the benefit of the global finance aristocracy. We can see these processes at work even now in Greece, which under the aegis of “austerity” is being forced to despoil its own citizens so as to transfer their wealth abroad. What will probably end up happening, as has happened in the past, is that foreign capital will come in to pick up the pieces of Greece’s economy, investing in enterprises that will serve to transfer more wealth to the international financial elite.²

“Free trade” agreements are another means by which the North continues to exploit the South. NAFTA is the classic example. This agreement has resulted, for example, in the devastation of Mexican peasant agriculture due to the flooding of Mexico’s market by the products of subsidized U.S.-based corporations. Income is transferred from ordinary people in Mexico to corporate coffers in the U.S., as peasants lose their livelihood and seek employment up north in America—where they can be exploited again, this time as labor-power. It is essentially the same kind of thing that Frank analyzed in *Capitalism and Underdevelopment in Latin America*, whereby tariff policies and foreign investment obstruct the satellite’s development and benefit the metropolis (or at least its corporate sector).

Dependency theory is therefore still as relevant, or almost as relevant, as it was forty years ago. That is, its acknowledgement of the North’s exploitation of the South is just as relevant; whether its theoretical premises remain compelling is another question, to which the answer might well be “No.” With respect to much of Andre Gunder Frank’s early work, the answer *is* no, although the notion of an economic surplus being transferred abroad seems worth keeping. Contrary to Frank’s proposed solution, however, the remedy for this injustice is either governmentally [semi-]directed capitalist development, as in contemporary Brazil, or an *international* anti-capitalist movement—because it is on the global stage that true socialism will have to be born.

¹ Brenner goes on to argue that not only does the existence of a market and its “profit motive” not in itself cause the transformation of a pre-capitalist class structure to a capitalist one (as Frank’s position might lead one to expect); it can even *intensify* the former [i.e. entrench it, make it worse]. Thus, the slavery-based and/or semi-feudal regimes of labor control in most of Latin America were intensified by production for the market: unfree workers were squeezed more and made even less free so that they would produce more. Their low income, in turn, limited the development of a domestic market, “while there arose significant demand for luxuries [*produced abroad*] by the ruling class.” Brenner continues: “Meanwhile, precisely the fact of forced labour in agriculture, either in pure form (slavery) or in correlation with peasant possession of subsistence plots, undermined the economies’ ability to develop a free wage labour force for industry.” Thus, the absence of a capitalist class structure was one cause of continued underdevelopment. Such a structure, moreover, can arise only through class struggle and political events, not “spontaneously” through market incentives. Robert Brenner, “The Origins of Capitalist Development: A Critique of Neo-Smithian Marxism,” *New Left Review* I/104, July-August 1977, 25-92.

The Barbarous Legacy of Capitalism in Latin America

Since its colonization about five hundred years ago, Latin America has been ever more dominated by relations of commodity production for external markets, and secondarily for internal ones. With crucial collaboration by Latin America's merchant and landowning classes, Europe and, later, North America have ensured that the production (or extraction) and export of such commodities as silver, sugar, tobacco, coffee, rubber, fertilizers, bananas, indigo, oil, and cocaine have for centuries been foundations of societies south of the U.S. This fact has had deleterious implications for both the people and the environment of Latin America. Dependency theorists argue that it has entailed the continent's underdevelopment by means of the metropole's extraction of economic surplus—which has meant a corresponding depletion of wealth available for the continent's development—but in this paper I will focus on the brute facts of class conflict and environmental destruction. These have occurred all over the world as capital has deepened and broadened its dominion since the 1400s, but Latin America, like much of the global South, has suffered in ways somewhat different from the North, due both to the continued presence of indigenous peoples and to the subordination of internal development to the needs of foreign capital (and its effective "representatives" in the domestic economy). In the following, accordingly, I will consider several examples of how export-oriented commodity production has shaped Latin America's social landscape in conflict-ridden ways.

Steve Stern states the matter concisely in the first sentence of *Peru's Indian Peoples and the Challenge of Spanish Conquest: Huamanga to 1640* (1982): "This book tells how conquest transformed vigorous native peoples of the Andean sierra into an inferior caste of 'Indians' subordinated to Spanish colonizers and Europe's creation of a world market."¹ For the sake of extracting economic surplus, from the mid-sixteenth century the colonizers began to impose on the native peoples of Peru such oppressive institutions as the *encomienda*, the *mita*, and, later, *yanacónaje*. The forced labor of the *mita*, for example, was for decades the principal means of exploiting mercury and silver mines, in addition to organizing work in such enterprises as textile workshops and sugar mills. Aside from the horrors of work and the low pay in a regime defined by *mita* labor, indigenous communities were gradually coerced into losing their ancient integrity, their self-sufficiency and internal vitality. Indian resistance was fierce, however, although it usually manifested itself in subtler and shrewder ways than collective uprisings, especially after the colonial state had been consolidated by Toledo's reforms in the 1570s. More commonly, Indians used Spanish juridical frameworks to defend their land and independence, often successfully. By the seventeenth century, their constant litigation "disrupted enterprise and incomes, shut down workshops, and pinched production with labor bottlenecks. Cheap *mita* labor grew scarce and unreliable."² The state form of extraction that consisted of *mitas* and tribute payments therefore deteriorated under the impact of pervasive and institutionalized Indian resistance.

In the long run, however, things did not improve for most natives; rather, new modes of controlling labor appeared that continued to undermine indigenous society and independence. Private forms of exploitation such as *yanacónaje* (long-term personal bondage to a master) and primitive wage labor became more integral to the social system than they had been earlier. As the market economy penetrated deeper into former enclaves of indigenous self-sufficiency, monetizing economic transactions and exacerbating divisions between rich and poor, and as entrepreneurs expropriated valuable resources such as irrigable lands and coca plantations, poorer Indians were compelled to rent themselves out in order to pay off debts or simply to survive. "Over time, then, colonial relationships gave rise to economic dependencies driving natives into the arms of colonials."³ People abandoned village life in order to accumulate funds or start their lives anew, perhaps hoping to follow in the path of the minority of successful Indian entrepreneurs. The

² *Ibid.*, 128.

³ *Ibid.*, 153.

social structure continued to evolve in contradictory ways, but the ultimate result is clear: as Stern says, “The most dramatic creation—and legacy—of the first century of colonization was Indian poverty.”¹

Indian dispossession and poverty have continued up to the present; Emilio Kouri discusses an intervening period, the late nineteenth century, in *A Pueblo Divided: Business, Property, and Community in Papantla, Mexico* (2004). Unlike Stern, he focuses on a specific commodity, vanilla, showing how its growth in popularity overseas contributed to the demise of communal landholding in a particular region of Mexico between the 1870s and 1890s. Broadly speaking, Kouri recognizes three causes of the privatization of land in Veracruz: first, government officials had a fanatical commitment to the ideology of liberalism and private property; second, putting communal lands in private hands would augment property tax revenues and so assuage Veracruz’s dire fiscal condition; third, the boom in the vanilla trade (among others), which resulted largely from improvements in communications and transport, heightened the value of land and made it worth controlling. The actual division of communal lands was a complicated, decades-long process full of interruptions, temporary compromises, legal machinations, government corruption, outbreaks of violence, two large rebellions, and state repression. By 1900 the transformation was complete: almost a third of Papantla’s old communal territory belonged to townspeople, mostly big merchants, and a small Indian elite; the rest of the lands remained the property of native family farmers who had become landowners. More than a half of Indian households, however, were left propertyless by the triumph of privatization and parcelization, and inequalities in wealth and power were now guaranteed by differential access to land.² “Town merchants and Totonac [indigenous] bosses now reigned supreme,” Kouri summarizes, “many Indian agriculturalists were now anything but independent, and the old bonds of community—whatever they once were—had long since frayed. This was the world that vanilla had made.”³

Strictly speaking, of course, it is not a particular commodity that makes such a world but capital itself, the flow of ever-accumulating capital, which uses commodities as means to augment itself, a process that often entails privatization, dispossession, mass oppression, and environmental despoliation. A particularly effective way for capital to valorize itself is by extracting and refining oil; not surprisingly, such activities, being especially useful to capital, are also especially destructive to natural and social environments. This is clear from the two books *Crude Chronicles: Indigenous Politics, Multinational Oil, and Neoliberalism in Ecuador* (2004) and *The Ecology of Oil: Environment, Labor, and the Mexican Revolution, 1900-1938* (2006), by Suzana Sawyer and Myrna Santiago respectively. Although the books pertain to very different times, places, and categories of people, there are striking parallels between the stories they tell. In both cases, multinational oil companies invade a region and tear apart communities and natural habitats; the state is either unwilling or unable to assert itself against them sufficiently to protect the populations affected; the latter, whether Ecuadorian natives in the 1990s or Mexican workers in the 1920s, unite to defend themselves against corporate tyranny. A key difference between the cases is that the Mexican workers were citizens of a state that, during and after the Mexican Revolution, was ideologically and to some extent substantively on the side of “the people,” which opened up opportunities for organized labor. As Santiago relates, the militancy of Mexican oil workers, while frustrated for many years by the power of multinationals and the weakness of the revolutionary state, finally, in 1938, provoked one of the decisive events of modern Mexican history: President Cárdenas’s nationalization of the foreign oil industry. The details of this event need not concern us; suffice it to say that it grew out of a collective-bargaining dispute between labor and capital dramatized by the latter’s flagrant violation of Mexican laws and the former’s strike activity, which forced Cárdenas to act—on behalf of law and labor. This example serves as a welcome reminder that, while Latin America’s history is a tragic one, not all the major victories have been won by the plunderers.

Ecuador in the 1990s conforms to the usual depressing pattern, however. Facing an alliance between the neoliberal state and multinational corporations, Indians fighting to protect their communities,

³ Ibid., 283.

their independence, and their habitat did not have much of a chance. Through popular mobilization they achieved some partial victories, and they succeeded in creating headaches for the state and its wealthy allies, but on a broad scale the neoliberal agenda was unstoppable. In 1994, for example, the government not only passed an important law that threatened communal lands but also revised the Hydrocarbon Law so that state intervention in the oil industry was diminished, the price of gasoline was deregulated, new oil fields were granted to private companies, and environmental protections were undermined.¹ The fatal potential of these developments is clear when one reflects that crude oil's most toxic components have been shown to lead to skin disease, nerve damage, reproductive abnormalities, and cancer in humans, and that the industrial processes associated with oil extraction themselves produce pollutants.² Since industrial accidents were rampant in the 1980s and 1990s, the indigenous peoples of Ecuador had cause for alarm. What happened in Mexico in the early twentieth century, however, was even worse, as the rainforest in the Huasteca was destroyed, oil conflagrations that lasted months killed workers and indigenes, "worker housing was showered with toxic chemicals routinely," and mundane accidents caused death-by-asphyxiation or oil-drowning.³ All these tragedies make oil, as a commodity, the quintessential symbol of capital's violent nature.

Some commodities, by virtue of their production process, give workers more opportunities to exercise agency than others. According to Gillian McGillivray, sugar in Cuba was such a commodity, at least in the nineteenth and most of the twentieth centuries. In *Blazing Cane: Sugar Communities, Class, and State Formation in Cuba, 1868-1959* (2009), she recounts how sugarcane farmers and the workers they hired frequently burned cane fields as a way to assert their interests against sugarmill owners or in times of political upheaval. "It created jobs," McGillivray notes, "to burn cane that would otherwise be left standing until sugar brought a better price. The burned cane had to be cut and hauled to the mill, and the fields needed to be cleared and replanted during the dead season leading up to the next harvest."⁴ (Burned cane had to be cut and milled within twenty-four hours lest it lose its sucrose.) Burning cane also made it easier to cut, and it improved working conditions in the fields. In certain contexts, such as times of political repression, burning fields could also be a revolutionary act, a means of protesting colonialism and elite rule. Undertaken on a sufficiently large scale, cane fires were an effective form of economic sabotage and a way to spread revolution. Their political importance was summed up by one of Fidel Castro's comrades: "Revolution in Cuba means burning sugarcane—it did in 1868, 1895, and 1930-33, and it did for us."⁵ Through this sort of resistance at the point of production, i.e. at the fulcrum of society, workers turned their daily subordination and dependency on its head: they showed that in fact capital and its social order were dependent on *them*, that they had the power to shut society down. They could even install political leaders who promised to overthrow the rule of capital, as in the case of Castro.

Again, though, the balance of power under capitalism is such that it is usually capital, not labor, that wields violence and remakes the world in its image. The history of Latin America is one long confirmation of this. Consider the 1980s, for example. The violence of that decade in Central America was largely due to capital's attempts to suppress leftist insurrections by means of death squads and U.S.-backed paramilitary forces. Jeffery Paige makes it clear in *Coffee and Power: Revolution and the Rise of Democracy in Central America* (1997) that a major impetus behind the reactionary savagery in El Salvador, Nicaragua, and Guatemala was the coffee-growing landed elite, which had a greater interest than the "agro-industrial" class in controlling labor. "The revolutionary crises of the 1980s," he argues, "were crises of the coffee elites and the societies they made at the end of the nineteenth and the beginning of the twentieth

centuries.”¹ As usual, therefore, the supremacy of a specific export commodity, or rather of capital as invested in the production of this commodity, brought hardship and even death for peasants and workers in Latin American countries. A similar thing happened in the 1930s, when uprisings against elites in El Salvador and Nicaragua were bloodily crushed by military force. The hubris and inhumanity of capital are on full display when tens of thousands of campesinos and laborers are slaughtered for the sake of maintaining complete capitalist control over society.

A bourgeois apologist might argue that capitalism as manifested in Latin America has had more positive than negative consequences for the environment and the majority of people, but that would be a hard argument to make. Examples can be multiplied almost without end of environmental and human agony as capital has steamrolled the continent. Given that commodity production is the foundation of the social structure, Indians and workers have had most success at softening their oppression when interfering with production itself. For instance, when Pastaza Indians in 1989 threatened seismic crews working for an oil company and confiscated their equipment, a presidential advisor flew in with company representatives to discuss indigenous grievances.² Interference with production could not simply be ignored. Nevertheless, even such minor victories as this have been rare compared to the number of defeats—the constant stream of defeats, from the sixteenth century to the twenty-first, from Mexico to Argentina. How long this sad history will continue is an open question, but one can expect it not to end until capitalism itself does.

Reading *Contemporary Latin America* (2008) by Ronaldo Munck. It seems that you can divide the last hundred years of Latin America’s history into four phases, more or less. First there was the agro-export, politically and economically oligarchic phase that was left over from the nineteenth century. Of course it included the beginnings of industrialization in some countries, early attempts at state-led development, etc. After the 1930s and until the 1970s there was the statist phase of import-substitution industrialization and populist mobilization of the masses in many parts of the region. (Less so in Central America.) To quote Munck, “Since the Second World War, the most significant change in the social structure of Latin America has been, undoubtedly, the effect of import-substitution industrialization. The simple overwhelming fact is that whereas agriculture employed over half the labour force in 1950, it provided work for less than a third of the total by 1980. The rise of industry is not quite so dramatic, although in most countries it accounted for a quarter or more of the working population by 1980.” In this era the continent became urbanized. The developmentalist phase petered out by the 1970s for reasons I find a little obscure but that apparently have to do with excessive government debt, elite reaction against populism and democracy, the rise of global finance, the conservative ascendancy all over the hemisphere. So the era of neoliberalism began, the brutal military dictatorships, civil wars in Central America, the hollowing out of the state in favor of privatization, increasing social inequality, etc. The “fourth” phase is, I suppose, little but a kinder, gentler version of neoliberalism: a consolidation of democracy in recent years, a “left turn” that has tried to bring back some of the positive features of the so-called statist phase. (The 1990s fused quasi-democracy with continued harsh neoliberalism, but the latter has been softened in the last ten years.) Better economic performance than under the military dictatorships, but still widening social inequality. More social movements, but more and more chaos, it seems. Like everywhere else.

That rather crappy paper on Plato and Marx I wrote years ago is finally getting published in a philosophy journal, called *Philosophy Now*. I was surprised to get an email from someone at the magazine a few days ago, years after I’d submitted the paper.

Reading *Golden Gulag: Prisons, Surplus, Crisis, and Opposition in Globalizing California* (2007), by Ruth Wilson Gilmore. Here’s a summary of part of her argument:

¹ Jeffery Paige, *Coffee and Power: Revolution and the Rise of Democracy in Central America* (Cambridge, MA: Harvard University Press, 1997), 5.

² Suzana Sawyer, *Crude Chronicles*, 64.

California began to come apart during the world recession of 1973-75. After a false boom in the late 1970s, fueled by federal outlays that created jobs in both the military and aerospace industries and at the community level, California entered a new phase of political and economic restructuring in the early 1980s, during which time the bifurcation between rich and poor widened. While profits rose, capital's need for infusions of investment dollars was increasingly met out of retained earnings. Deep reductions in well-waged urban jobs that had employed modestly educated men of color—especially African Americans and Chicanos—overlapped with changes in rural industrial processes and a long drought. These forces produced surpluses of capital, labor, and land, which the state, suffering a prolonged period of delegitimation, manifested in the taxpayers' revolts, could not put back to work under its declining military Keynesian aegis. However, by renovating and making “critical already-existing activities,” power blocs in Sacramento and elsewhere did recombine these surpluses—and mixed them with the state's aggressive capacity to act—by embarking on the biggest prison construction program in the history of the world.

The point is that as capital relocated in the 1970s, and automation made more and more workers redundant, and bad things happened to agriculture, and Pentagon funding shrank, etc., surpluses in land, labor, and capital developed. Since the Keynesian state that funded education and helped disadvantaged people was losing legitimacy (because of recessions, voters fed up with tax increases, conservative politics of “law and order,” and so forth) even as surpluses in land, people, and capital accumulated, the state turned to prison construction as a way to “legitimately” put surpluses to work. Financial capital was happy to lend to the state for prison construction (as for anything else, as long as it paid); politicians found it convenient to blame societal woes on drugs and crime; many voters were in the mood to crack down on those hooligans in Los Angeles and elsewhere who were ruining America; rural areas going through hard times welcomed new prisons because they could potentially create jobs and raise the value of land. Prison construction surely had an added benefit in that it didn't necessitate the redistribution of wealth in a way that was unfavorable to elites, so it was politically “safe” in that regard. Just like military or “national security” spending. Criminal laws got tougher, in effect so that the expanding prison complex would have a *raison d'être*. For example, even though drug use declined in the 1980s, imprisonment of drug users increased. The “three strikes” law was also passed (in 1994), etc.

Now I'm reading the second edition of Barry Eichengreen's *Globalizing Capital: A History of the International Monetary System* (2008). You know about the gold standard in the late nineteenth century; I won't go over the history of how it came about. But I'll discuss how it worked. David Hume's price-specie flow model is still generally accepted, though it has to be modified in its particulars. Here are the essentials:

....Hume considered a world in which only gold coin circulated and the role of banks was negligible. Each time merchandise was exported, the exporter received payment in gold, which he took to the mint to have coined. Each time an importer purchased merchandise abroad, he made payment by exporting gold.

For a country with a trade deficit, the second set of transactions exceeded the first. It experienced a gold outflow, which set in motion a self-correcting chain of events. With less money (gold coin) circulating internally, prices fell in the deficit country. With more money (gold coin) circulating abroad, prices rose in the surplus country. The specie flow thereby produced a change in relative prices.

Imported goods having become more expensive, domestic residents would reduce their purchases of them. Foreigners, for whom imported goods had become less expensive, would be inclined to purchase more. The deficit country's exports would rise, and its imports fall, until the trade imbalance was eliminated.

Modifying Hume's analysis to take into account the circulation of paper money rather than (or in addition to) gold within each country doesn't change its essentials.¹ The basic mechanism for adjusting relative prices and the balance of trade remains the same. (I guess it applies to any system of fixed exchange rates, right?) But it's necessary to mention the role of central banks.

When a country ran a payments deficit and began losing gold, its central bank could intervene to speed up the adjustment of the money supply. By reducing the money supply, central bank intervention put downward pressure on prices and enhanced the competitiveness of domestic goods, eliminating the external deficit as effectively as a gold outflow. Extending [Hume's] model to include a central bank that intervened to reinforce the impact of incipient gold flows on the domestic money supply thus could explain how external adjustment took place in the absence of substantial gold movements.

Typically, the instrument used was the discount rate. Banks and other financial intermediaries lent money to merchants for sixty or ninety days. The central bank could advance the bank that money immediately, in return for possession of the bill signed by the merchant and the payment of interest. Advancing the money was known as discounting the bill; the interest charged was the discount rate. Often, central banks offered to discount however many eligible bills were presented at the prevailing rate.... If the bank raised the rate and made discounting more expensive, fewer financial intermediaries would be inclined to present bills for discount and to obtain cash from the central bank. By manipulating its discount rate, the central bank could thereby affect the volume of domestic credit. It could increase or reduce the availability of credit to restore balance-of-payments equilibrium without requiring gold flows to take place. When a central bank anticipating gold losses raised its discount rate, reducing its holdings of domestic interest-bearing assets, cash was drained from the market. The money supply declined and external balance was restored without requiring actual gold outflows.

As it happens, central banks sometimes didn't follow these rules about where to set the discount rate. Other considerations were important, such as the fact that raising interest rates to stem gold outflows might depress the economy. Also, "central banks hesitated to raise interest rates because doing so increased the cost to the government of servicing its debt."

Let's take a break for a minute. I want to answer some questions I have about exchange rates. The basic principle, I guess, at least for floating exchange rates, is that a country's currency will rise in value if it is in demand—if there is excess demand relative to supply. It will decrease in value if there is excess supply relative to demand. A currency, therefore, is like any other commodity; it follows the laws of supply and demand. So, for example, if the U.S. Federal Reserve raises interest rates, foreign investors will exchange their own money for dollars in order to buy assets from the U.S. The international demand for dollars will thus increase, which will raise the value of dollars (just as the price of some product rises when demand for it does). Other currencies will lose value as investors exchange them for dollars. Conversely, lower interest rates tend to result in currency depreciation, because investors are less interested in assets denominated in that currency. So their demand for that currency declines, and its price falls.

Another factor that can influence exchange rates is the balance of payments. Let's just think about the current account. According to a fairly reliable website, "A deficit in the current account shows the country is spending more on foreign trade than it is earning, and that it is borrowing capital from foreign sources to make up the deficit. In other words, the country requires more foreign currency than it receives through sales of exports, and it supplies more of its own currency than foreigners demand for its products. The excess demand for foreign currency lowers the country's exchange rate until domestic goods and services are cheap enough for foreigners, [who then start buying more products from the country in

¹ Of course paper money can circulate in a country that's on the gold standard, as long as you can exchange a specified amount of paper money for a specified amount of gold.

question, which means that its currency is in greater demand, which raises its price, i.e. its exchange rate].” By the way, the balance of payments is related to the terms of trade. “If the price of a country’s exports rises by a greater rate than that of its imports, its terms of trade have improved. An improvement in terms of trade shows greater demand for the country’s exports,” and thus indicates greater demand for its currency (with which to buy exports), which means that its currency will appreciate. Conversely, “if the price of exports rises by a smaller rate than that of its imports, the currency’s value will decrease in relation to its trading partners.”

Now consider inflation. “As a general rule, a country with a consistently lower inflation rate [than other countries] exhibits a rising currency value, as its purchasing power increases relative to other currencies.... Those countries with higher inflation typically see depreciation in their currency in relation to the currencies of their trading partners.” In terms of demand and supply of currencies, I guess you could say that investors demand the low-inflation currency because when the assets they buy are paid off in the future, the real value of the money with which they’re paid will be relatively high. A country that has high inflation will pay its debt with money whose value is diminishing quickly. So investors will tend to shun that country, and its currency will depreciate.

Large-scale government debt, too, tends to cause currency depreciation, because it tends to cause inflation. The reason for this, I suppose, is that government spending increases aggregate demand, which encourages inflation. Also, the government might end up printing more money to pay its debt, which is of course inflationary.

But wait, according to another source, inflation can cause *appreciation*, at least in the short run. This is largely because when investors expect inflation, they expect that country’s central bank to raise interest rates in order to counteract the inflation.¹ [Similarly, high budget deficits can cause the cost of borrowing to rise--i.e., interest rates to rise--which means that the currency appreciates.] But even when investors don’t think the central bank is strongly committed to minimizing inflation, the country’s relatively low real interest rate “still creates some demand for its currency as global investors seek to do business there.” That is, the “*other*” kind of investors might want to *borrow* the country’s money (to do business there) because of low interest rates. In the *long* run, however, research shows that inflation does tend to reduce demand for the affected currency.

I also don’t have a clear understanding of foreign exchange reserves. Here’s a definition: they are “those external assets that are readily available to and controlled by monetary authorities for direct financing of payments imbalances, for indirectly regulating the magnitudes of imbalances through intervention in exchange markets to affect the currency exchange rate, and/or for other purposes.” So, for example, if a country’s currency is depreciating, its central bank might artificially create demand for the currency by using some of its foreign exchange reserves to buy it. (That is, it releases foreign currency into the marketplace in exchange for domestic currency, which it takes out of circulation.) Similarly, “a central bank can intervene on the foreign exchange markets to prevent currency *appreciation* by selling its own currency for foreign currency-denominated assets, thereby building up its foreign reserves as a happy side effect.” This is what China has been doing, in order to boost its export economy.

Incidentally, it is called “sterilization” when a central bank mitigates the effects of foreign exchange interventions on its domestic money supply by buying or selling government bonds. For instance, taking some of its currency out of circulation (in order to defend its exchange rate) reduces the domestic money supply.² This will likely have a deflationary effect, slowing down economic activity. In order to prevent this outcome, the central bank will “sterilize” its foreign exchange intervention. “It can do this by engaging in open market operations that supply liquidity into the system, by buying financial assets such as local-

¹ The reason why higher interest rates reduce inflation is that they discourage borrowing and encourage consumers to save rather than spend. In other words, they reduce the money supply.

² One way it does so is by creating or worsening a current account deficit “due to the propped-up exchange rate being more favorable for importers than for exporters. This deficit sends currency out of the country, further decreasing liquidity [i.e., the amount of local currency held by individuals, banks, etc.]”

currency-denominated bonds, using local currency as payment.” Thus it injects money into the domestic economy.

In the opposite case, when a country prevents its currency from appreciating by selling it for foreign assets, a similar sterilization can occur to prevent the domestic money supply from increasing. It’s true that the money “spent buying foreign assets initially goes to other countries, but then it soon finds its way back into the domestic economy as payment for exports. The expansion of the money supply can cause inflation, which can erode a nation’s export competitiveness just as much as currency appreciation would.” So the central bank then sells bonds domestically, “thereby soaking up new cash that would otherwise circulate around the home economy.” Alternatively, reserve requirements for banks can be raised, which has the effect of preventing monetary expansion (because it means that banks have less money to lend out).

Back to the book. Before 1913, central banks were firmly committed to defending their country’s gold reserves and maintaining the currency’s convertibility. That was the highest priority. (Later in the twentieth century governments were pressured to subordinate currency stability to other objectives, such as high employment, but before World War I this wasn’t a problem. Labor parties were still in their formative years, the right to vote was mostly limited to men of property, and “the worker susceptible to unemployment when the central bank raised the discount rate had little opportunity to voice his objections....”) Investors’ knowledge of this caused them to act in ways that actually ended up stabilizing currencies—anticipating, as it were, central banks’ reactions to things like currency depreciations. “Knowing that the authorities would ultimately take whatever steps were needed to defend convertibility, investors shifted capital toward weak-currency countries, financing their deficits even when their central banks temporarily violated ‘the rules of the game.’”

The extent to which Europe’s central banks cooperated in pre-war times to help each other maintain gold reserves and defend their currencies during crises is impressive. It helps account for the relative stability of the system.

Until the late 1890s the gold standard was associated with deflation, and with economic hardship for farmers and workers. The Populist explanation is probably right: output worldwide was growing faster than the global gold stock. Money supplies finally started to grow only when new gold discoveries were made in Australia, South Africa, and Alaska, and when the cyanide process was invented to extract gold from impure ore. “The association of the gold standard with deflation dissolved.” The expansion of money supplies must have also played a role in the prosperity of the years before World War I (or so it seems to me).

Here’s a good summary of what happened after the resurrection of the gold standard in the 1920s:

With the spread of unionism and the bureaucratization of labor markets, wages no longer responded to disturbances with their traditional speed. Negative disturbances gave rise to unemployment, intensifying the pressure on governments to react in ways that might jeopardize the monetary standard. Postwar governments were rendered more susceptible to this pressure by the extension of the franchise, the development of parliamentary labor parties, and the growth of social spending. None of the factors that had supported the prewar gold standard was to be taken for granted anymore.

The interwar gold standard, resurrected in the second half of the 1920s, consequently shared few of the merits of its prewar predecessor. With labor and commodity markets lacking their traditional flexibility, the new system could not easily accommodate shocks. With governments lacking insulation from pressure to stimulate growth and employment, the new regime lacked credibility. When the system was disturbed, financial capital that had once flowed in stabilizing directions took flight, transforming a limited disturbance into an economic and political crisis. The 1929 downturn that became the Great Depression reflected just such a process. Ultimately, the casualties included the gold standard itself.

A lesson drawn was the futility of attempting to turn the clock back. Bureaucratized labor relations, politicized monetary policymaking, and the other distinctive features of the twentieth-century environment were finally acknowledged as permanent. When the next effort was made, in the 1940s, to reconstruct the international monetary system, the new design featured greater exchange rate flexibility to accommodate shocks and restrictions on international capital flows to contain destabilizing speculation.

The first half of the 1920s was characterized mostly by floating exchange rates, which, given contentious political climates, were made unstable by volatile speculation. So Europe and much of the world returned to the gold standard, hoping greater stability would result. In the end, it didn't work out that way. I'll skip over the pre-Great Depression complexities—some countries having too much gold, others having too little, etc.—and focus on the 1930s. After the collapse of industrial production in 1929, governments “naturally wished to stimulate their moribund economies. But injecting credit and bringing down interest rates to encourage consumption and investment was inconsistent with maintenance of the gold standard. Additional credit meant additional demands for merchandise imports. Lower interest rates encouraged foreign investment. The reserve losses they produced raised fears of currency depreciation, prompting capital flight.” In short, expansionary initiatives and gold convertibility were incompatible.

Governments' commitment to defending convertibility was no longer as credible as before World War I (because of the more politicized environment, workers and farmers having a greater capacity to influence the political process), so speculators were jittery. “As soon as speculators had reason to think that a government might expand domestic credit, even if doing so implied allowing the exchange rate to depreciate, they began selling its currency to avoid the capital losses that depreciation would entail.” Thus, they brought about what they feared: depreciation. Nevertheless, because central banks' credibility was already in doubt, they “defended the gold parity to the bitter end” (so their credibility wouldn't suffer even more). “Hence, the gold standard posed a binding constraint on intervention in support of the banking system.” International cooperation could have alleviated the problem, but it was prevented by the fact that governments had different interpretations of what the problem was. So, in the end, the gold standard collapsed.

First (in 1931) it was the Central European countries that abandoned the gold standard. Austrian and German banks had invested heavily in industry, so they were hit hard by the depression. Central banks couldn't bail them out without causing a depreciation of the currency that effectively destroyed the gold standard, so this is what happened. Actually, currency depreciation didn't go to hyperinflation extremes, because exchange controls (or capital controls) were implemented. (Capital controls are “regulations limiting the ability of firms or households to convert domestic currency into foreign exchange.”) These ensured that not much capital or gold was transferred abroad. Britain and other countries left the gold standard later in 1931, then the U.S. in 1933, etc. Floating exchange rates returned, but this time central banks managed them so that there was less volatility than in the early 1920s.

“Having severed the link with the gold standard, governments and central banks had greater freedom to pursue independent economic policies.” So they cut interest rates, initiated expansionary fiscal programs, etc. All this involved currency depreciation, which enhanced the competitiveness of goods produced domestically and stimulated exports (creating tensions with trading partners). “The timing of depreciation goes a long way toward explaining the timing of recovery. The early devaluation of the British pound helps to explain the fact that Britain's recovery commenced in 1931. U.S. recovery coincided with the dollar's devaluation in 1933. France's late recovery was clearly linked to its unwillingness to devalue until 1936. The mechanism connecting devaluation and recovery was straightforward. Countries that allowed their currencies to depreciate expanded their money supplies. Depreciation removed the imperative of cutting government spending and raising taxes in order to defend the exchange rate. It removed the restraints that prevented countries from stabilizing their banking systems.”

Now for postwar events. The Bretton Woods system didn't come fully into effect until the late 1950s, because of problems associated with Europe's reconstruction. (Countries suffered from dollar shortages, they had to impose tariffs to encourage development, and so forth.) Some basic provisions of the

system were that controls limited international capital flows—though less effectively by the 1960s—and currencies were pegged to the dollar, which was convertible to gold at \$35 per ounce. So it was basically a regime of fixed (though adjustable) exchange rates. The problem with it was that it was too dependent on the dollar (and its conversion into gold).¹ As governments accumulated immense dollar reserves (which financed the U.S.'s increasing balance-of-payments deficits), the dollar's convertibility into gold began to be called into question. A scenario became conceivable in which some foreign holders sought to convert all their dollar reserves into gold, thereby triggering the same behavior on the part of other holders worried about dollar devaluation. It would be like an old-fashioned run on the bank: everybody would want to get their gold out before the currency was devalued—thus forcing the currency to be devalued. Actually, for most or all of the 1960s it was recognized that the dollar was overvalued in terms of gold, but international cooperation and an array of ad hoc financial devices resorted to by the Kennedy and Johnson administrations postponed dollar devaluation (and/or an end to Bretton Woods). Again, the basic problem was that the U.S. refused to enact the policies needed to rectify persisting balance-of-payments deficits, for instance through devaluation or slashing government spending (in order to counteract inflation). *Vietnam*—and also the Great Society—was the problem, or a big part of it. The inevitable result was that investors transferred funds from the overvalued dollar to more reliable currencies like the deutsche mark. These trends became overwhelming in 1971, and in August it was reported that Great Britain and France planned to convert dollars into gold. So the Nixon administration abruptly ended the dollar's convertibility (for a few months, I guess?). Subsequently the dollar was devalued, and in 1973 it was devalued again, but this didn't reassure the market. (After all, it was perfectly conceivable that it would be devalued yet again.) So by 1973, most European countries had unpegged their currencies from the dollar and adopted floating exchange rates. This finally signalled the end of Bretton Woods.

The need for floating exchange rates was a consequence of the increasing mobility of capital. It got harder to maintain capital controls, which were necessary under Bretton Woods in light of the fact that governments tended to be unwilling to take the measures necessary to adjust balance-of-payments disequilibria (e.g. because there might be adverse implications for employment). Governments were even reluctant to devalue their currencies, because the merest hint that they were going to do so would provoke rampant speculation against their currencies. Actually, after Bretton Woods there were other alternatives to floating exchange rates: a region like Europe could move toward monetary union, which it eventually did. Or small, weak countries could make an absolute and uncompromising commitment to peg their currencies to those of a trading partner, thereby avoiding the destabilizing capital movements associated with floating exchange rates.

In terms of volatile exchange rates, the 1970s weren't too bad. More volatile than Bretton Woods, but not as bad as the 1980s. The reason is that in the 1970s there was "more concerted intervention [by governments], more extensive use of capital controls, and greater willingness to adapt policies to the imperatives of the foreign-exchange markets" than in the 1980s. The latter decade is complicated, so....screw it. There was dollar overvaluation and then undervaluation into the 1990s. Bush and Clinton didn't do much to counteract undervaluation. Why? Because "an overvalued currency, like the dollar in the mid-1980s, imposes high costs on concentrated interests (producers of traded goods who find it difficult to compete internationally) who powerfully voice their objections. In contrast, an undervalued currency, like the dollar in the mid-1990s, imposes only modest costs on diffuse interests (consumers who experience higher inflation and import prices) who have little incentive to mobilize in opposition."

I'll skip Europe. As for developing countries, here are a couple of informative paragraphs:

Pegging [weak currencies to strong currencies] proved increasingly difficult to reconcile with the effort to liberalize financial markets. Developing countries had resorted to policies of import substitution and financial repression [i.e., anti-liberalization] in the wake of World War II. In Latin America, for example, where countries suffered

¹ Well, another problem was that mechanisms to adjust (or to force the adjusting of) balance-of-payments disequilibria were inadequate. These two problems cooperated to cause the downfall of the system.

enormously from the depression of the 1930s, the lesson drawn was the need to insulate the economy from the vagaries of international markets. Tariffs and capital controls were employed to segregate domestic and international transactions. Price controls, marketing boards, and financial restrictions were used to guide domestic development. The model worked well enough in the immediate aftermath of the war, when neither international trade nor international lending had yet recovered and a backlog of technology afforded ample opportunity for extensive growth. With time, however, interventionist policy was increasingly captured by special-interest groups. Trade and lending picked up, and the exhaustion of easy growth opportunities placed a premium on the flexibility afforded by the price system. As early as the 1960s, developing countries began to shift from import substitution and financial repression to export promotion and market liberalization.

The consequences were not unlike those experienced by the industrialized countries: as domestic markets were liberalized, international financial flows became more difficult to control. Maintaining capital controls became more onerous and disruptive. And with the increase in the number of commercial banks lending to developing countries, international capital movements grew in magnitude, making their management more troublesome. It became increasingly difficult to resist the pressure to allow the currency to appreciate when capital flowed in or to let the exchange rate depreciate to facilitate adjustment when capital flowed out.

As a consequence, more and more developing countries unpegged their exchange rates. The resultant volatility sometimes caused severe problems, though.

It seems to me that no option is very good: not ineluctable fixed rates, not fixed but adjustable rates, not completely floating rates, and not “managed floating” rates. And not monetary union, as the current crisis in Europe is showing. In the context of globalization, there are no good solutions. —But there were no “good” solutions under the pure gold standard either. Balance-of-payments adjustments were painful for the population. The problem, then, is capitalism itself, or maybe even the market system in whatever social context.

Last, I’ll say something about recent “global imbalances.” China and other countries in the South (“emerging markets”) have been growing at high rates, earning more than they could or would invest at home—i.e., their national savings have exceeded their investment—such that they have run current account surpluses. The U.S., on the other hand, has for many years had large current account deficits and very low savings rates. The emerging markets have chosen to invest most of their excess savings in the U.S., because by stockpiling dollar reserves they can keep their economies stable and growing. (Presumably the reasons are, first, that all this global demand for dollars keeps the dollar fairly strong, which lets U.S. consumers buy imports from these export-driven economies. Second—relatedly—stockpiling dollar reserves gives these countries the ability to manipulate their own exchange rates.) So, with the U.S. “absorbing the vast majority of [emerging markets’] excess savings, the result was a peculiar situation where savings in poor countries were financing consumption in one of the richest.” The poorer countries funnel money to the richer so that the latter can continue to buy products from the former. Strange.

Incidentally, I don’t really understand why U.S. saving has been so low in recent decades. I guess it has to do with low interest rates, which are in part a result of the Fed’s concern to keep the economy going. And this concern must exist because the corporate class war of recent decades has weakened aggregate demand, making the immense accumulation of debt a precondition for economic growth. To say it differently, households haven’t been able to save much probably just because they haven’t had enough income. And with all the financial bubbles, they’ve probably thought they didn’t have to save a lot but

could borrow on the expectation of high future earnings.¹ As the last few years have shown, that plan didn't work out so well.

June, July

Reading *The Crisis of Democracy: Report on the Governability of Democracies to the Trilateral Commission* (1975), by Samuel Huntington, Michel Crozier, and some Japanese guy. It's an important book, as Chomsky frequently tells his audiences.

Huntington: "*The vitality of democracy in the United States in the 1960s produced a substantial increase in governmental activity and a substantial decrease in governmental authority.*" The decrease in authority is what concerns him, as a representative of the ruling elite. He bemoans the "excess of democracy" that the 1960s produced and calls for more "moderation." —Remember, the Trilateral Commission is the liberal end of the political spectrum. The turn towards neoliberalism after the early 1970s was, in large part, an attempt by political and economic elites to regain control of society after democratic excesses had undermined authority. All the nastiness of the war on drugs, the war on welfare, the so-called war on crime, the war on workers, the penal state, etc.—all this was the elite's furious reaction to the sixties and early seventies.

The Age of Diminished Expectations (1997), by Paul Krugman. A sort of primer on the U.S. economy. You have to take what Krugman says with a grain of salt, since he's a mainstream economist, but if you sift through his arguments he can be useful.

"The slowdown of American productivity growth since the early 1970s [is] the most important single fact about our economy.².... Had productivity over the last 25 years grown as fast as it did for the first 70 years of this century, our living standards would now be at least 25 percent higher than they are." Not exactly. Productivity growth has picked up in the last twenty years, but that hasn't helped most of the population much. Why not? Because there's no labor movement. [And because the government has abdicated its responsibility for popular well-being.] The corporate sector gets most of the gains from productivity growth—which gives it more resources with which to smash the labor movement, thereby making things even worse for the lower and middle classes.

(Just to be sure, I emailed those thoughts to the economist Robert Pollin, who agreed with me.)

Krugman has no idea why productivity growth slowed down. But mainstream economists have a solution: we should all consume less now so that more resources are available for investment. Yes. Save more, spend less. That's the answer. It's brilliant, isn't it? It doesn't occur to these people that if consumption declines, companies won't have much of an incentive to invest more. But that's economists for you.

Stuff on the U.S. trade deficit: One reason it's a bad thing is that it entails a loss of jobs in manufacturing (because more imports are coming in than exports are going out). But it's possible for that job loss to be made up elsewhere in the economy, for instance in the service sector. (What Krugman doesn't mention, of course, is that service jobs, being harder to unionize, tend to be lower-paying.) Another reason the trade deficit is bad is that it entails "a gradual mortgaging of future U.S. income to foreigners." The reason is that the deficit has to be covered by our selling assets to foreigners, such as stocks, bonds, real estate, and even corporations themselves. Thus, our net international investment position has deteriorated from the early 1980s, when trade deficits started accumulating. "From now on, the U.S. will be obliged to deliver a stream of interest payments to foreign bondholders, rents to foreign landowners, and dividends to foreign stockholders.... Our payments to foreigners are a direct drain on our resources, and the longer the

¹ Low interest rates come into play with these financial bubbles too. Eichengreen remarks, for example, that low rates fueled the housing boom. And "higher real estate prices made households feel wealthier," so they took out more debt and spent more.

² That's wrong. The most important fact is and was rising inequality.

trade deficits continue, the larger this drain will become.”¹ Beautiful poetic justice: for almost two centuries the U.S. extracted surplus from other countries, but now, finally, those countries are starting to extract surplus from us. For now, it isn’t a huge problem; it may well become one, though. Especially if someday in the future the confidence of foreign investors in the U.S. is shaken and they abruptly sell off dollars and stop lending to us. Then an economic crisis might ensue, as it did in Latin America in the early 1980s.

I wouldn’t be terribly surprised if this is what happens eventually, decades from now. In that case, rapid inflation will occur (given the dollar’s depreciation), and the IMF, if it still exists, might have to bail us out on the condition of structural adjustment programs. What magnificent irony that would be! By the time it happens, though, the world will surely be in the midst of its centuries-long evolution out of capitalism, and economic convulsions will be happening all over the place.

So why did trade deficits balloon in the 1980s? According to Krugman and other mainstream economists, it’s partly because of the ballooning budget deficit. (Hence the idea of the “twin deficits.”)

The basic story runs as follows: Beginning in 1981, U.S. national saving began to fall sharply. Only part of that fall was a result of the budget deficits [which soaked up private saving]—hence the need to qualify the “twin deficit” view a bit—while part of it represented a change in the behavior of households. In any case, what happened was that U.S. national saving began falling well short of U.S. investment demand, which remained strong. If the U.S. economy had not had access to world capital markets, this saving shortfall would have produced a crunch that pushed interest rates sky-high. Instead, the United States was able to turn to foreigners to fill the gap. Much of U.S. investment was financed, not out of our own savings, but through the sale of assets to foreigners.

As a matter of straightforward accounting, the United States always buys exactly as much as it sells from the rest of the world. If it sells foreigners more assets than it buys, it must correspondingly buy more goods than it sells. So the emergent U.S. dependence on foreign capital to finance its investment had as an inevitable counterpart the emergence of a trade deficit. The ultimate cause of the trade deficit therefore lies in a decline in U.S. saving—partly, but not entirely, due to the budget deficit.

I asked Pollin about that; he replied: “Krugman is right strictly in terms of accounting. But in terms of causation, he is wrong. I doubt that he himself would still hold to this position today. In terms of causation, the trade deficit is due to the rise of globalization—with manufactured goods getting produced in developing countries to a hugely growing extent. That, along with the high level of oil imports, swung the U.S. into a net deficit trade position.” It also must have to do with the decline in the competitiveness of American products in the 1970s and afterwards—their shoddy construction, etc.

I asked Dean Baker too; he wrote back, “My guess is that Krugman would no longer argue in the same way on the trade deficit. The proximate cause of the trade deficit is the over-valued dollar, that is what leads people to buy foreign goods rather than U.S. made goods. It is pretty hard to come up with a story whereby the dollar would be appreciably lower today if the deficit fell or private savings rose, especially when you have governments like China committed to sustaining an over-valued dollar. I hope this is helpful.”

After discussing the crises in Mexico and Argentina in the 1990s, Krugman sums up a major problem with the world economy today: many countries are “vulnerable to what amounts to the whims of the capital markets. A country need not follow unsound policies to get in trouble; all that need happen is for investors to conclude, for whatever reason, that the country is at risk—and their loss of confidence will produce a crisis that justifies their fears.” That is, when they stampede to sell off the currency, it will depreciate precipitously; in order to keep capital in the country and prevent hyperinflation, the government

¹ [On the other hand, U.S.-owned assets abroad tend to be riskier and higher-yielding than foreign-owned assets in the U.S., so we still have a steady stream of income coming in to us from the outside. This is one of the perks of the dollar’s being the global reserve currency.]

will have to impose very high interest rates, which will depress the economy....thereby confirming investors' fears about the economy's stability! It's a self-fulfilling prophecy. Behold the hazards of unregulated financial markets.

On the other hand, it is in part these deregulated markets that keep the world economy going, by means of bubbles that permit the extension of enormous credit to consumers and businesses.

Wolfgang Streeck remarks in his article "The Crises of Democratic Capitalism" (2011) that "democratic states [are] being turned into debt-collecting agencies on behalf of a global oligarchy of investors." It's the tyranny of the bondholder. For example, in Germany, "Populist rhetoric to the effect that perhaps creditors should also pay a share of the costs [of economic adjustment], as vented by [Angela Merkel] in early 2010, was quickly abandoned when 'the markets' expressed shock by slightly raising the rate of interest on new public debt." Governments are quite afraid of that possibility: "Given the amount of debt carried by most states today, even minor increases in the rate of interest on government bonds can cause fiscal disaster." Investors want austerity, so austerity is what they get. (Of course, the elite's *ideological* obsession with cutting public spending plays a role too.)

Reading *A Brief History of Neoliberalism* (2005), by David Harvey. The inflation of the 1970s, as you know, resulted from government attempts to keep the Keynesian, labor-accommodating state going in a poorer economic climate, an environment of slower economic growth than the two postwar decades. The high inflation manifested the crisis of the Keynesian state. Double-digit inflation couldn't go on forever; it had to end, surely, in more or less the way it did, with the turn to restrictive monetary policies that facilitated the destruction of unions and other conservative attacks on the population.

Harvey's observations on finance are interesting. The OPEC oil price hike placed vast amounts of money at the disposal of oil-producing states; the Saudis, under U.S. pressure, agreed to funnel all their petrodollars through New York investment banks. "The latter suddenly found themselves in command of massive funds for which they needed to find profitable outlets. The options within the U.S., given the depressed economic conditions and low rates of return in the mid-1970s, were not good." So the banks looked abroad, toward governments, which were the safest bet. In order to lend to them, though, international credit and financial markets had to be liberalized, a strategy that the U.S. actively pursued throughout the 1970s. Developing countries were hungry for credit, so they borrowed even at disadvantageous rates. What followed a few years later was the debt crisis of the 1980s. Here Harvey inserts a telling comment: "[Mexico's debt crisis demonstrated] a key difference between liberal and neoliberal practice: under the former, lenders take the losses that arise from bad investment decisions, while under the latter the borrowers are forced by state and international powers to take on board the cost of debt repayment no matter what the consequences for the livelihood and well-being of the local population." Good old-fashioned neoliberal hypocrisy.

Useful:

[One general trend in neoliberalism] is for the privileges of ownership and management of capitalist enterprises—traditionally separated—to fuse by paying CEOs (managers) in stock options (ownership titles). Stock values rather than production then become the guiding light of economic activity and, as later became apparent with the collapse of companies such as Enron, the speculative temptations that resulted from this could become overwhelming. The second trend has been to dramatically reduce the historical gap between money capital earning dividends and interest, on the one hand, and production, manufacturing, or merchant capital looking to gain profits on the other. This separation had at various times in the past produced conflicts between financiers, producers, and merchants.... During the 1970s much of this conflict either disappeared or took new forms. The large corporations became more and more financial in their orientation, even when, as in the automobile sector, they were engaging in production. Since 1980 or so it has not been uncommon for corporations to report losses in production offset by gains from

financial operations (everything from credit and insurance operations to speculating in volatile currency and futures markets).

So how did elites manufacture popular consent in their efforts to restore their own class power after the 1960s and respond to the crisis of capital accumulation in the 1970s? Through propaganda, of course. The Chamber of Commerce, the National Association of Manufacturers, the newly organized Business Roundtable, and other groups set about conquering the political and the popular mind. Think-tanks like the Heritage Foundation, the American Enterprise Institute, and the Hoover Institute were formed. And neoliberal economics captured the research universities and business schools that churned out the technocrats who worked at the IMF, the World Bank, and other such institutions.

Harvey has a good discussion of New York City's fiscal crisis in 1975. "Capitalist restructuring and deindustrialization had for several years been eroding the economic base of the city, and rapid suburbanization had left much of the central city impoverished. The result was explosive social unrest on the part of marginalized populations during the 1960s, defining what came to be known as 'the urban crisis'.... The expansion of public employment and public provision—facilitated in part by generous federal funding—was seen as the solution. But, faced with fiscal difficulties, President Nixon simply declared the urban crisis over in the early 1970s." That was ridiculous, but it served as an excuse to diminish federal aid. As the recession of the mid-1970s got worse, New York's budget situation grew dire. Finally in 1975 a cabal of investment bankers refused to roll over the debt and pushed the city into bankruptcy. "The bailout that followed entailed the construction of new institutions that took over the management of the city budget." Draconian policies later associated with the IMF were imposed on the city, partly so that bondholders would get their money back and partly so that financial institutions could restructure the city in their interest. "Wealth was redistributed to the upper classes in the midst of a fiscal crisis," as would be the case in country after country for the next forty years. "The New York city crisis was 'symptomatic of an emerging strategy of disinflation coupled with a regressive redistribution of income, wealth, and power.'" After a few years of the austerity measures, "'many of the historic achievements of working-class New York were undone.' Much of the social infrastructure of the city was diminished and the physical infrastructure (for example the subway system) deteriorated markedly for lack of investment or even maintenance." Etc. In the meantime, investment bankers were remaking the city for the benefit of business (especially in finance, legal services, the media, and consumer-oriented areas), using public resources to build the appropriate infrastructure. "Working-class and ethnic-immigrant New York was thrust back into the shadows, to be ravaged by racism and a crack cocaine epidemic of epic proportions in the 1980s."

To sum up: "The management of the New York fiscal crisis pioneered the way for neoliberal practices both domestically under Reagan and internationally through the IMF in the 1980s. It established the principle that in the event of a conflict between the integrity of financial institutions and bondholders' returns, on the one hand, and the well-being of the citizens on the other, the former was to be privileged. It emphasized that the role of the government was to create a good business climate rather than look to the need and well-being of the population at large. The politics of the Reagan administration....became 'merely the New York scenario' of the 1970s 'writ large.'"

What happened to New York after the 1960s and 1970s reminds me a little of what happened to Paris after 1848, under the Second Empire. Striking parallels in terms of counterreaction to popular unrest and physical, social, and economic restructuring.

Meanwhile, businesses sought to capture the Republican Party as their own instrument, which was facilitated by recent campaign finance laws and pro-business decisions of the Supreme Court. To establish a solid electoral base, Republicans formed alliances with the Christian right.

Harvey is right that neoliberalism is riddled with contradictions, many of which fall under the category of hypocrisies. Both in theory and in practice there are contradictions. The result is that the neoliberal state is inherently unstable. Neoconservatism can be construed as a response to this instability. In some ways, neoconservatives and neoliberals work well together: they both favor corporate power, elite governance, private enterprise, the restoration of class power, and they're suspicious of democracy. But neoconservatives place a greater emphasis on "order" as an answer to the "chaos of individual interests"

(neoliberal atomization), and they're attracted to the ideas of nationalism, cultural traditions, and an overweening morality as "the necessary social glue to keep the body politic secure in the face of external and internal dangers." In theory, neoliberalism isn't concerned with the nation but rather with the state (and the market); neoconservatism is interested in both. Taken to their logical conclusions, its prescriptions imply a world of competing nationalisms, competing cultures and moralities, competing authoritarianisms. It is, in other words, a modern incarnation of fascism. Quite different from neoliberalism, though in practice there are clear "elective affinities."

So how did neoliberalism spread from the U.S. and U.K. to the rest of the world? You know about structural adjustment programs, Latin American dictatorships, and so on. Underlying all that was the increasing mobility of capital and the turn toward more open financialization, facilitated by the spread of the new economic orthodoxy to agenda-setting institutions. In addition, "the U.S. used the carrot of preferential access to its huge consumer market to persuade many countries to reform their economies along neoliberal lines." On the reasons for U.S. dynamism in the 1990s, Harvey remarks that "flexibility in labour markets and reductions in welfare provision....began to pay off for the U.S. and put competitive pressures on the more rigid labour markets that prevailed in most of Europe and Japan. The real secret of U.S. success, however, was that it was now able to pump high rates of return into the country from its financial and corporate operations (both direct and portfolio investments) in the rest of the world. It was this flow of tribute from the rest of the world that founded much of the affluence achieved in the U.S. in the 1990s."

Neoliberalism has had a dismal record at fostering global growth; its main substantive achievement "has been to redistribute, rather than to generate, wealth and income." The primary means by which it has done this is "accumulation by dispossession," or what Marx called primitive accumulation. That didn't end centuries ago; it has continued up to the present and even accelerated. Under neoliberalism there are innumerable techniques for robbing people of resources. Even—or especially—public goods previously won through generations of class struggle, such as social welfare provision, public education, and regulatory frameworks, have been pillaged and destroyed.

—That reminds me of the destruction of the commons and of medieval regulations in Europe during the transition from feudalism to capitalism. It's always dangerous to construct abstract typologies, but, to repeat what I've said before, there appear to have been two [or one-and-a-half] "cycles" in capitalist history. Abstractly you can think of it in this way: first, a lot of ancient communal practices and public goods were dismantled before, during, and after the Industrial Revolution. You could call this the first wave of privatization. (It has continued unceasingly all over the world, but let's just call it the first wave.) As it was going on, the victims of capitalism sought to maintain their old rights and/or acquire new, governmentally protected ones. At length they succeeded to some extent, and new public goods were consolidated under the Keynesian welfare state. This was probably a nearly inevitable development, because, as Polanyi said, marketization and privatization will, if unchecked, eventually cause the total destruction of society. So popular resistance, aided by sane elements of the upper classes, succeeded in regulating further depredations and temporarily saving society. But technology kept progressing, capital mobility increased, global integration continued, populations kept growing, and the "public" [and *politicized*] nature of the Keynesian state started encroaching too much on capitalist class power. Finally the masses got out of hand, got too politicized, too powerful—all those crazy ideas of democracy in the 1960s!—and there was a capitalist backlash, made possible by (and making possible) ever-more-globally-integrated markets and elite institutional networks [and extreme capital mobility worldwide]. The inflationary consequences of popular empowerment in a context of economic stagnation (the 1970s) were tamed, namely by destroying popular empowerment. That is, the second wave of privatization occurred: public goods were again dismantled and "accumulation by dispossession" began anew. This time, the old nationalist Keynesian solution to the horrors of privatization wasn't available, since the world had become too integrated and nations themselves were deteriorating. So transnational social movements were necessary. But would they prove strong enough to save society?? Stay tuned!

Anyway, you see there's a logic to it all. A "dialectical" logic.

I'm reading stuff on transnational labor history and activism, but I need frequent breaks. Most of it is tedious and superfluous. Labor history in general, at least as done by most academics, doesn't seem to present many opportunities for imagination and creativity. I have the soul of a poet, philosopher, and psychologist, but I want to understand society and I long for human liberation, so I read things that otherwise might not interest me. Only when I turn, say, to Lukács's reflections on Dostoyevsky in *Marxism and Human Liberation: Essays on History, Culture, and Revolution* do I feel really at home. I'm reminded of why Dostoyevsky struck me like a revelation—especially in *Notes from the Underground*—years ago. Like when Stavrogin, the hero of *The Possessed*, writes in a letter

I tried my strength everywhere. You advised me to do this so as to learn “to know myself.”... But what to apply my strength to – that's what I have never seen and don't see now.... I can still wish to do something good, as I always could, and that gives me a feeling of pleasure. At the same time I wish to do something evil and that gives me pleasure, too.... My desires are not strong enough, they cannot guide me. You can cross a river on a log but not on a chip of wood.

That's still sort of my problem, as it is the problem of millions of people everywhere. The solitude of life in the modern world... “By this solitude, by this immersion of the subject in itself, the self becomes bottomless. There arises either the anarchy of Stavrogin, a loss of direction in all instincts, or the obsession of a Raskolnikov by an ‘idea.’” I've experienced both, but a shallow version of the former is much more common. Aimlessness. It was already a widespread social disease in the second half of the nineteenth century, but in the twentieth century it reached epidemic proportions. Hence R. D. Laing and such theorists, who see people unconsciously obsessed with testing the reality of their existence. (A deficit of communal life = a deficit of self-confirmation = a deficit of the sense of self.) I don't see any prospect that this characteristic malady of modernity will be overcome within the next century.

Reading *The Problems of Philosophy* (1912) by Bertrand Russell. I'm inclined to agree with most of it. (In a lot of ways I'm basically a Cartesian. That's supposed to be incompatible or in tension with being a Marxist, but I've never understood why. Sure, Descartes tended to emphasize the individual and Marx the collective, but I see no logical inconsistencies between positions that are taken to define Cartesianism and those that define Marxism.)

Something I hadn't considered is that one way of expressing the denial that ‘ought’ can be derived from ‘is’ is by saying that judgments attributing or denying intrinsic value to something (such as “Happiness is good”) are *a priori*. They can't be justified by, deduced from, experience; instead, we *bring them to* experience. On the other hand, it seems strange to call value-judgments *knowledge*, as Russell does. I'd prefer to reserve the term “*a priori* knowledge” for things like mathematics and logic. But, in a sense, this may be quibbling.

Russell sensibly rejects much of traditional empiricism, such as its denial that mathematics is *a priori*¹ and its nominalism. (Nominalism is at least in tension, if not incompatible, with the rationalist recognition that the mind imposes forms on experience, i.e. that we necessarily experience the world through the prism of our own mental “forms,” universal “ideas” by means of which we interpret the particularities of sensory data.) In addition, he credits Kant for showing it's possible to have *a priori* knowledge that isn't analytic, “i.e. such that the opposite would be self-contradictory.” Another topic on which I agree with Russell. Incidentally, I admit that some of my previous discussions of the so-called synthetic *a priori* have been confused, in part because the philosophical literature suffers from ambiguities and confusions. But my intuition that there's a kind of *a priori* that isn't merely analytic has been right, and Russell shares it.

A useful summary:

¹ J. S. Mill, for instance, thought that arithmetic was based on inductive generalizations. (“So far, in my experience two objects added to two objects have always equaled four objects. But it's possible that sometime in the future I'll discover an instance where that isn't true.” Idiocy.)

Hume (1711-76), who preceded Kant, accepting the usual view as to what makes knowledge *a priori*, discovered that, in many cases which had previously been supposed analytic, and notably in the case of cause and effect, the connexion was really synthetic. Before Hume, rationalists at least had supposed that the effect could be logically deduced from the cause, if only we had sufficient knowledge. Hume argued—correctly, as would now be generally admitted—that this could not be done. Hence he inferred the far more doubtful proposition that nothing could be known *a priori* about the connexion of cause and effect. Kant, who had been educated in the rationalist tradition, was much perturbed by Hume's scepticism, and endeavoured to find an answer to it. He perceived that not only the connexion of cause and effect, but all the propositions of arithmetic and geometry, are 'synthetic', i.e. not analytic: in all these propositions, no analysis of the subject will reveal the predicate. His stock instance was the proposition $7 + 5 = 12$. He pointed out, quite truly, that 7 and 5 have to be put together to give 12: the idea of 12 is not contained in them, nor even in the idea of adding them together. Thus he was led to the conclusion that all pure mathematics, though *a priori*, is synthetic; and this conclusion raised a new problem of which he endeavoured to find the solution. [Namely, how is synthetic *a priori* knowledge possible?]

Russell has an interesting criticism of Kant's rationalist solution. "The thing to be accounted for [he reminds us] is our certainty that the facts must always conform to logic and arithmetic. To say that logic and arithmetic are contributed by us [as Kant says] does not account for this. Our nature is as much a fact of the existing world as anything, and there can be no certainty that it will remain constant. It might happen, if Kant is right, that to-morrow our nature would so change as to make two and two become five. This possibility seems never to have occurred to him, yet it is one which utterly destroys the certainty and universality which he is anxious to vindicate for arithmetical propositions...." However Kant would reply to Russell—invoking his idiosyncratic transcendental idealism—the objection seems powerful. Actually, on one interpretation it isn't: to explain our knowledge of synthetic *a priori* truths, *obviously* we have to invoke our human nature. We're so constituted....etc. On the other hand, what we "know" is that things *will always be* such that 2 and 2 are 4, etc. Such *a priori* propositions are not about our human nature but about things themselves. They aren't really, or merely, "laws of *thought*," as it would be natural to call them according to the Kantian position; they're (as far as we're concerned) laws of *things*, laws of reality. "When we judge that two and two are four, we are not making a judgement about our thoughts, but about all actual or possible couples. The fact that our minds are so constituted as to believe that two and two are four, though it is true, is emphatically not what we assert when we assert that two and two are four. And no fact about the constitution of our minds could make it *true* that two and two are four." Is this objection to Kant's position decisive? It seems so, but I'm not sure.

After disposing of Kant's answer, Russell offers his own. First, he argues that universals (viz., nearly all words) are neither mental nor physical. I argued the same in my paper on ontology, with the difference that I said all *concepts* are neither mental nor physical. No doubt my terminology was inexact, but my position amounted to much the same as Russell's and Frege's. As for Russell's answer to Kant's question, I don't entirely understand it. It has something to do with the claim, which is surely true, that "all *a priori* knowledge deals exclusively with the relations of universals [as opposed to particulars]." It also has to do with what Russell calls *intuitive knowledge*—immediate knowledge of truths, more precisely of self-evident truths. "Among such truths are included those which merely state what is given in sense, and also certain abstract logical and arithmetical principles.... Our *derivative* knowledge of truths consists of everything that we can deduce from self-evident truths by the use of self-evident principles of deduction."—Right. So I guess the answer is that our *a priori* knowledge is of self-evident truths. Um, yes, I agree. But Kant's purpose was precisely to explain why these truths are self-evident! It's not a very "deep" explanation just to say, "Well, '2 + 2 = 4' is self-evident, and that's that." I was hoping for something deeper—but I'm not surprised I didn't get it, because there *is* nothing deeper in the case of *a priori* truths.

There's only the Kantian, or semi-Kantian, invoking of human nature (the structure of the mind, etc.)—which itself is pretty obvious. With regard to *a priori* truths, you can't bring in further reasons aside from their self-evidence (and/or the relevant logical or mathematical laws, which are self-evident).

Not surprisingly, Russell is a “foundationalist,” like me. He recognizes that there are truths that can't be inferred from some other truth; we just “intuitively” know they're true, as I said in my paper on the analytic/synthetic distinction [on Academia.edu]. “We must sooner or later, and probably before very long, be driven to a point where we cannot find any further reason, and where it becomes almost certain that no further reason is even theoretically discoverable. Starting with the common beliefs of daily life, we can be driven back from point to point, until we come to some general principle, or some instance of a general principle, which seems luminously evident, and is not itself capable of being deduced from anything more evident.” Yes, *luminously evident*. Like Descartes said. Contemporary philosophers, being idiots, don't like to agree with Descartes, but there *are* propositions, probably an infinity of them, that are just *self-evident*.¹

Is it true, as Russell says, that there are some ethical principles that are self-evident? Is “We ought to pursue what is good” self-evident? It seems so, insofar as it seems to be a matter of definition that we ought to do what is good, not what is bad. But how would you answer this question conclusively? Is that even possible? What are the implications of the fact that it isn't clear that the statement is absolutely, “luminously” self-evident? One of the implications is obviously that it isn't always self-evident whether the property of “self-evidence” applies to a given statement. Weird. And that raises questions about whether it's *ever* justifiable to invoke a “luminous” “intuition” of “self-evidence.” And yet *sometimes* it obviously *is* justifiable!—as in the case of ‘ $2 + 2 = 4$.’ Ugh. Philosophy is maddening.

Russell has some reasonable suggestions relating to these doubts about self-evidence:

One important point about self-evidence is made clear by the case of memory, and that is, that self-evidence has degrees: it is not a quality which is simply present or absent, but a quality which may be more or less present, in gradations ranging from absolute certainty down to an almost imperceptible faintness. Truths of perception [i.e., of what sense-data one is physically perceiving at that moment] and some of the principles of logic have the very highest degree of self-evidence; truths of immediate memory have an almost equally high degree. The inductive principle has less self-evidence than some of the other principles of logic, such as 'what follows from a true premiss must be true'. Memories have a diminishing self-evidence as they become remoter and fainter; the truths of logic and mathematics have (broadly speaking) less self-evidence as they become more complicated. Judgements of intrinsic ethical or aesthetic value are apt to have some self-evidence, but not much.

Degrees of self-evidence are important in the theory of knowledge, since, if propositions may (as seems likely) have some degree of self-evidence without being true, it will not be necessary to abandon all connexion between self-evidence and truth, but merely to say that, where there is a conflict, the more self-evident proposition is to be retained and the less self-evident rejected.

It seems, however, highly probable that two different notions are combined in 'self-evidence' as above explained; that one of them, which corresponds to the highest degree of self-evidence, is really an infallible guarantee of truth, while the other, which corresponds to all the other degrees, does not give an infallible guarantee, but only a greater or less

¹ There's *definitely* an infinity of them if you agree with Russell that “those [statements] which merely state what is given in sense” are self-evident. [But even if you don't want to give them that august label, you can still say that no further reason—aside from your having the sense-perception in question—is discoverable for saying that you're looking at a patch of blue or whatever. In other words, it seems to me you can be a foundationalist without having to say that the “foundational” truths are always *self-evident*, a concept that is difficult to get a handle on because of its vagueness or emptiness in a philosophical context.]

presumption. This, however, is only a suggestion, which we cannot as yet develop further....

I find myself very sympathetic to most of Russell's arguments.¹

Another example: he thinks truth consists in "*correspondence with fact*." He rejects the coherence theory of truth, as I did in my senior thesis, though he agrees with me that coherence can be an important *test* of truth (because reality is consistent with itself). These positions are utterly obvious, and it testifies to academics' incapacity for abstract thought that they can doubt them. (Coherence as the *meaning* of truth?? What planet do these people live on?!²)

Russell's summary of his discussion of knowledge: "Both as regards intuitive knowledge and as regards derivative knowledge, if we assume that intuitive knowledge is trustworthy in proportion to the degree of its self-evidence, there will be a gradation in trustworthiness, from the existence of noteworthy sense-data and the simpler truths of logic and arithmetic, which may be taken as quite certain, down to judgements which seem only just more probable than their opposites. What we firmly believe, if it is true, is called *knowledge*, provided it is either intuitive or inferred (logically or psychologically³) from intuitive knowledge from which it follows logically. What we firmly believe, if it is not true, is called *error*. What we firmly believe, if it is neither knowledge nor error, and also what we believe hesitatingly, because it is, or is derived from, something which has not the highest degree of self-evidence, may be called *probable opinion*." All that seems quite reasonable, though maybe it has to be refined.

Russell's explanation in the last chapter of the value of philosophy has a lot in common with what I've said in the past. Philosophy enlarges, or should enlarge, the mind. Its chief value is its very uncertainty. It militates against fanaticism and ignorance. It elevates.

Hume's *Enquiry Concerning the Principles of Morals*, which he considered "incomparably the best" of all his writings, is a good example. It's a sheer joy to read. What a writer he was! A sort of Olympian elevation above vulgarity. I needn't add that the "empiricist," "sentiment-al" spirit that animates it is that which has animated most of my serious reflections on morality.

Insofar as its spirit is utilitarian, however, I'm more skeptical of it. I'm inclined to say to Hume, "For the sake of argument, I grant that most morals, customs, and laws have evolved on account of their social utility. Nevertheless, it is not their usefulness that makes moral things (or people) moral. Nor is it primarily because of their usefulness that we praise moral acts and virtuous people."⁴ It's true that our knowledge that moral acts and virtuous people do good things for society, i.e. "useful" things, is psychologically relevant to our approbation; but it seems to me that on a more basic level what we value, what we consider morally worthy, is just the treating of people with respect, as ends, as beings to whom we ought to commit ourselves in much the same way as we're committed to ourselves. We value the caring about others; we attribute moral worth to people and acts to the extent that they're motivated by concern and respect for others [and by the application to oneself of standards that one applies to others]. The good consequences that ensue for others are morally relevant only insofar as they're signs of the character of the person and/or act that brought them about.

But I'm starting to have doubts. And Hume might not disagree with me in any case.

He's certainly right, however, to limit the role of self-love in the human mind. It isn't the source of every sentiment or act; the many examples he gives of unselfish sentiments suffice to prove that.

¹ [But I'm not sure it makes sense to say that self-evidence has degrees. Surely something is either self-evident or not, right? How can it be "half" self-evident, so to speak? My dad suggests that Russell is confusing self-evidence with certainty: the former is objective, the latter subjective (and either *more* or *less*, unlike self-evidence). But on the other hand, a self-evident proposition is self-evident *to someone*; there is therefore some role for subjectivity. Right...?]

² The statement "The weather today was sunny" is true not because the weather was sunny but because that statement is coherent with some ill-defined "web of beliefs"? Jesus.

³ "Psychological inference" is a technical concept of his.

⁴ It's possible I'm misinterpreting Hume by attributing those positions to him.

“Sympathy,” a kind of disinterested pleasure or pain from the consideration of others’ happiness or suffering, is an affect of undeniable power. The admiration we feel for a person of great talents or virtue can scarcely be attributed to our self-love or self-regard. More generally, humans are susceptible to a sort of psychic contagion: cheerfulness tends to make cheerful, sullenness to make sullen, magnanimity to make magnanimous. Wit pleases; lack of confidence displeases. However such “natural sympathy” may be, in particular contexts, mixed up with self-regard, it is in principle distinguishable from it. And it is this sympathy or humanity from whence spring moral intuitions.

Against what he calls the “selfish hypothesis”—“that, whatever affection one may feel, or imagine he feels for others, no passion is, or can be disinterested; that the most generous friendship, however sincere, is a modification of self-love; and that, even unknown to ourselves, we seek only our own gratification, while we appear the most deeply engaged in schemes for the liberty and happiness of mankind”—Hume asks, “What interest can a fond mother have in view, who loses her health by assiduous attendance on her sick child, and afterwards languishes and dies of grief, when freed, by its death, from the slavery of that attendance?” It does indeed sound paradoxical to say that all her self-sacrifice on behalf of her child is done fundamentally for her *own* sake. I would say, though, that in fact it is a product of two causes: first, her “disinterested”¹ love for her child, the existence of which it is hard to deny; second, the fact that her devotion to her child gives her a sense of self-validation, self-reality (this other being, whom she loves, *depends on her*). It gives her a purpose and so makes her “happy,” however anxious she is over the health of her child. When the child dies she loses, first, this supreme object of love, this person whose existence filled her with joy; second, she loses her purpose in life and feels useless, unreal, unvalidated. She loses much of her self-regard, because the outlet for her self-activity has vanished.

But how is “disinterested” love for another person psychologically possible? What does it “mean”? How is it possible that there can be any emotion that isn’t merely a manifestation or modification or perversion of self-regard?

Turning from the idealism of the Enlightenment to the dark investigations of modern psychology, the third volume of Havelock Ellis’s *Studies in the Psychology of Sex* (1913) is fascinating and somewhat disturbing. A wealth of data documents the differences between the sexes—broadly speaking, male dominance and female submission. Every feminist should read this book. It’s a magnificent refutation of naïve political correctness.

I’m teaching myself Spanish (and taking classes). It’s kind of fun to be learning a new language again. And Spanish is fun to speak. But really, who cares? –In two hundred years global warming will probably have killed off humanity. So....unless we do anything about it, we’re all just biding time.

But I’ll continue acting, like everyone else, as if we’re not on the precipice. [...]

I went to the Chicago socialism conference this weekend, held annually. About 1500 people from around the country and world. Inspiring to see so many like-minded people, and most of the talks were excellent. I’ve decided to become a member of the International Socialist Organization, which has three branches in Chicago. I don’t agree with all its positions—it’s a little too Leninist for me—but, on the whole, it seems like a worthy organization.

Reading Bukharin’s *Imperialism and World Economy*, the work that influenced Lenin. He’s right to emphasize the two contradictory tendencies of capital: its internationalization and its nationalization. The latter isn’t disappearing even in the age of globalization.

He argues, correctly, that monopoly capital pushes for high tariffs in order to raise prices in the home market, which allows it to sell products on the world market below the cost of production, i.e. to practice dumping. The dynamic that results on the world scale he describes as follows: “Cartel tariffs and the dumping system practiced by the foremost countries provoke resistance on the part of the backward countries which raise their defensive tariffs; on the other hand, the raising of tariffs by the backward countries serves as a further stimulus to raise the cartel duties that make dumping easier. Needless to say,

¹ That word is misleading.

the same action and counteraction take place both among the foremost countries in relation to each other and among backward countries in their mutual relations. This endless screw, perpetually applied by the growth of cartel organizations, has called forth the ‘tariff mania’....that has grown even more pronounced in our days.” The pressures toward this tariff insanity, which fans the flames of nationalist belligerence, help explain why after World War II international frameworks were developed to coordinate trade policy.

Bukharin continues:

The important economic part now played by tariffs brings about also the aggressive character of the policy of “modern capitalism.” Indeed, it is due to the tariffs that monopoly organizations gather additional profit, to be utilized also as export premiums in the struggle for markets (dumping). This additional profit may grow, generally speaking, in two ways: first, through more intensive selling inside the limits of the existing state territory; second, through the growth of the latter. As regards the former, there is an obstacle here in the shape of market capacity; one cannot imagine that the big bourgeoisie would begin to increase the share of the working class, in order to drag itself out of the mire by the hair. Cunning businessmen that they are, they prefer to follow the other way, the way of enlarging economic territory. The greater the economic territory, other conditions being equal, the greater will be the additional profit, the easier it will be to pay export premiums and to practice dumping, the larger consequently will be the foreign sales, and the higher the rate of profit.... [I]n our era the interests of finance capital [therefore] demand, first of all, an expansion of the home state territory, i.e., it dictates a policy of conquest, a pressure of military force, a line of “imperialist annexation.”.... There is nothing behind the discussions about the creation of a middle European tariff alliance but the wish to create a vast economic territory as a monopoly system allowing more successful competition on the external market. In reality this is a product of the interests and ideology of finance capitalism which, penetrating into all the pores of [the] world economy, creates at the same time an unusually strong tendency towards secluding the national organisms, towards economic autarchy as a means of strengthening the monopoly situation of the respective capitalist groups. Thus, together with the internationalization of the economy and the internationalization of capital, there is going on a process of “national” intertwining of capital, a process of “nationalizing” capital, fraught with the greatest consequences.

He was certainly right about that. It was one of the fundamental causes, or at least preconditions, of fascism, Nazism, and World War II.

Many of his arguments, like Lenin’s, were stated earlier by Hobson. For example, the big capitalists seek foreign markets because wage repression ensures that domestic demand is insufficient. (This argument was stated by Marx himself.) Another motive for imperialist annexation/occupation is that with the growth of industry, more sources of raw materials are needed. “England’s policy in Egypt, the transformation of all of Egypt into a gigantic cotton plantation furnishing raw material for the English textile industry, may serve as a striking illustration.” Third, the export of capital increases enormously in the era of monopoly capitalism because of over-accumulation—a paucity of attractive investment opportunities—at home. Also because the incentive to export capital, to establish a base in foreign countries, is even greater when tariffs obstruct the export of commodities from the home country. Bukharin goes on to say that “capital export unusually sharpens the relations between the great powers. Already the struggle for opportunities to invest capital, i.e., the struggle for concessions, etc., is always reinforced by military pressure. A government or a ‘country’ subjected to the manipulations of the financiers of the great powers ordinarily yields to that party which appears to be the strongest militarily....” And once huge sums of money, particularly fixed capital like railroads, electric plants, large plantations, etc., are invested in a foreign country, the capitalists of the exporting country want their wealth guarded.

All this seems pretty obvious. The reason these dynamics don’t lead to the same annexationist and militaristic-conflict-between-great-powers policies today as they did in the past must be, first of all, that

there are things like the WTO, the UN, the ICJ, and many, *many* other bodies that regulate global politics and the economy. Overt militaristic aggression would be frowned on, to say the least.¹ Second, after World War II Europe (and Japan) consciously abandoned, by and large, its former path of militarism. And in the nuclear age nobody wants wars between great powers. Third, after decolonization happened it was more politically difficult to use the heavy-handed tactics of the early twentieth century in dealing with ex-colonies. (This fact, however, has not stopped the U.S. from engaging in militaristic imperialism many times, indeed continually, over the last sixty years.) Fourth, after the decades-long task of transforming the economic structure of peripheral countries into a capitalist or quasi-capitalist one had finally been achieved—a task that necessitated sustained military intervention, political domination by the core countries, savage policies of (partial) destruction of the peasantry in order to create internal markets, especially labor markets—it was no longer necessary to be quite so interventionist in order to protect assets and make profits. The core countries could now, in general, rely on the power-structures, the class structures, the elite groups they had created in the peripheral countries to do most of the work for them, the work of keeping the masses in line and ensuring favorable conditions for capital accumulation.

And yet despite all these facts, military tensions grounded in economic and geopolitical competition persist. For example, lately the U.S. has been quietly establishing a military presence around China. An ominous development.

To resume: “We have laid bare three fundamental motives for the conquest policies of modern capitalist states: increased competition in the sales markets, in the markets of raw materials, and for the spheres of capital investment. This is what the modern development of capitalism and its transformation into finance capitalism has brought about. These three roots of the policy of finance capitalism, however, represent in substance only three facets of the same phenomenon, namely of the conflict between the growth of productive forces on the one hand, and the ‘national’ limits of the production organization on the other.” Interesting. Such a conflict does exist. Only with the destruction of the nation-state will it be possible to use and develop the productive forces rationally, so that they and their socially beneficial use aren’t obstructed by artificial barriers.

Quoting Hilferding: “The policy of finance capital pursues a threefold aim: first, the creation of the largest possible economic territory which, secondly, must be protected against foreign competition by tariff walls, and thus, thirdly, must become an area of exploitation for the national monopoly companies.” Bukharin expounds on that: “The increase in the economic territory opens agrarian [peripheral] regions to the national cartels and, consequently, markets for raw materials, increasing the sales markets and the sphere of capital investment; the tariff policy makes it possible to suppress foreign competition, to obtain surplus profit, and to put into operation the battering ram of dumping; the ‘system’ as a whole facilitates the increase of the rate of profit for the monopoly organizations. This policy of finance capital is imperialism.” That, in a nutshell, is the Leninist theory of imperialism. The difficult thing is to update it.

“[States] have become an exact expression of the interests of finance capital. [That may be exaggerated, but it’s basically true. The state serves the big financiers and industrialists.] Every one of the capitalistically advanced ‘national economies’ has turned into some kind of a ‘national’ trust. This process of the organization of the economically advanced sections of world economy, on the other hand, has been accompanied by an extraordinary sharpening of their mutual competition.... A mighty state military power is the last trump in the struggle of the powers. The fighting force in the world market thus depends upon the power and consolidation of the ‘nation,’ upon its financial and military resources. A self-sufficient national state, and an economic unit limitlessly expending its great power until it becomes a world kingdom—a worldwide empire—such is the ideal built up by finance capital.” He quotes Hilferding:

With a steady and clear eye does it [finance capital] view the Babylonian confusion of peoples, and above all of them it sees its own nation. The latter is real; it lives in a powerful state, which keeps on increasing its power and grandeur, and which devotes all its forces to making them greater. In this way, the interests of the individual are subjugated to the

¹ As it was when Bush invaded Iraq. But America is the godfather, so it can sometimes get away with stuff like that.

interests of the whole.... The class conflicts have disappeared; they have been annihilated, absorbed as they are in serving the interests of the whole. In place of the dangerous class struggle, fraught for the owners with unknown consequences, there appear the general actions of the nation which is united by one aim—the striving for national grandeur.

Bukharin remarks: “Thus the interests of finance capital acquire a grandiose ideological formulation; every effort is made to inculcate it into the mass of workers....” Mainstream academics might ridicule all this, but it seems pretty reasonable to me. Nationalism and fascism were able to happen because (at least for a while) they were expressions, albeit perverted ones, of the interests of “finance capital.”

In short, through a variety of complex mechanisms, the conflict between units of capital is sublimated into the conflict between states. And it continues to be. The state is therefore not yet on its way out—although the “nation” is, in a sense. But as nationality declines, as civil society disintegrates, the state itself will enter a period of crisis. It already is, in fact, partly by virtue of other things like colossal government debt (which is indirectly connected to the disintegration of society and nationality).

How closely will history repeat itself? How severe will competition between states be in the next fifty years? Not as severe as it was in the epoch of fascism. There will be a lot of cooperation between states to put down uprisings and to try to salvage the global economy. But there will also continue to be economic competition, and it’s impossible to predict how that will play out.

—It’s irritating to know that all the information is out there in order to have a true and full understanding of the world economy and politics, but that such an understanding isn’t humanly possible! I feel like I’m groping in the dark not for *bright* spots but for spots that are just a little less dark.

To resume: “Imperialism is nothing but the expression of competition between state capitalist trusts.” The word “trusts” is an exaggeration, but that statement is more or less true. Liberals like Paul Krugman say or imply that nationalist economic competition doesn’t exist or isn’t very important—trade benefits everyone, global interconnection is good for all countries, a rising tide lifts all boats, etc.—but that’s foolish. States do what they can to get the most resources for themselves, often at the expense of others. In the age of monopoly capitalism, this rapacity takes imperialistic forms. Surplus extraction through trade, investment, sometimes colonialism, and war—in partnership with corporations (effectively as their servant and enforcer, at least most of the time).

I got an email from AK Press, a publisher of Chomsky and other worthies of the far left, saying they’d like to publish a revised (*very* revised) version of my Master’s thesis. It’ll take a lot of work, but I’m pretty excited about it.

Reading a lot of books on cities, among them *Remaking Chicago: The Political Origins of Urban Industrial Change* (1999), *Spaces of Neoliberalism: Urban Restructuring in North America and Western Europe* (2002), *Chicago: Race, Class, and the Response to Urban Decline* (1987), and *Marxism and the Metropolis: New Perspectives in Urban Political Economy* (1984). And many, many others I’m reading in less depth. For my seminar paper this fall I want to explain how the political and economic elites of Chicago navigated the shoals of deindustrialization. Or, rather, I want to do something that pertains to that broad topic. I’m coming to appreciate that the future will be formed mainly in cities, and that the city will be the crucible, the proving-ground, of social movements. I have to become familiar with the literature.

*

Could the neoliberal state have arisen in the U.S. if the country didn’t have a lot of black people? What a terrible thing race has been all through history! The New Deal coalition was broken up because of the Civil Rights Movement and the New Left (which was inspired partly by the Civil Rights Movement). These are what made possible “Reagan Democrats,” white working-class (and middle-class) voters whose support allowed conservatives to smash unions. [All this is naive, a consequence of reading too much mainstream historiography. The proper analysis is that of Thomas Ferguson and Joel Rogers. See my summary of it below, in 2014.] In other words, the elitist-populist cultural and racial backlash against the

1960s facilitated the economic and political restructuring of the 1970s and 1980s. The war on drugs, which has made possible the vast expansion of prisons, has been directed mostly at blacks, as has the “war on crime,” which has led to the militarization of police forces and justified all kinds of political horrors. The war on welfare has succeeded in part because welfare is associated with black people. And so on. Nevertheless, while racism has been of inestimable value to the neoliberal agenda, I think economic and political evolution would have proceeded along similar, albeit less extreme, lines in recent decades even if it hadn’t been possible to exploit racial stereotypes. For one thing, neoliberalism has been a nearly global phenomenon, not only a U.S. one. And class bigotry exists too, not only racial bigotry. Middle-class whites are perfectly capable of mobilizing politically against poor whites. And working-class whites are capable of mobilizing against the “liberal elite,” not only for its perceived support of blacks but also for its supposed lack of patriotism, its support of foreigners, its Communism, its ties to Wall Street (!), etc. It’s always possible to manufacture some scapegoat or other; racial differences simply provide an extra-convenient way of doing so.

*

Apocalypse soon.— It seems to me that, at this point in history, environmental activism is more important than anything else, at least in the long run. In fifty years, the world won’t look like it does now. Economic chaos will be overshadowed by climate chaos. What we need is a global movement to plant and protect forests in as many places as possible.

*

People who argue that the “normal” state of capitalism is even growth, stability, “equilibrium,” etc., are funny. From 1800 to 1945 there wasn’t a whole lot of placid growth, stability, and equilibrium. From the late 1940s to the late 1960s, there was some of that, at least compared to the past. From the 1970s to the present, there hasn’t been any. So there was a twenty-year interregnum of relative peace and prosperity on two continents (or three, including Australia). A Keynesian, labor-accommodating, protectionist (except for the U.S.) interregnum. *That* is what begs for an explanation, not the chaos and crises of the present or past. Those come with the capitalist territory.

*

Here’s a paradox: from one perspective, you could have been another person, or even another kind of animal. You didn’t have to be the person you are; you could have been born someone else a hundred years later, or you could have been a lion or a chimpanzee or whatever. This is why it made sense for Plato to be thankful he was born a man and not an animal. From another perspective, though, you couldn’t have been anyone else, because you just are who you are. One entity can’t be another entity; it is itself, that’s all. So how do you reconcile these contradictory intuitions? My senior thesis gives the foundation of an answer in its distinction between the so-called “subjective” and “objective” selves. Specifically, from one perspective you, like other animals, are simply consciousness;¹ from another, you are your “empirical totality,” your whole physical and mental being. The basic thing I have in common with you is our consciousness (our being conscious), which is, ultimately, our selfhood. So, in a sense, we have our selfhood(s), our *selves*, our essences, in common. (This is an ancient and profound insight that has been rediscovered countless times over millennia.) But we are, after all, different people with different personalities, etc., and in that respect it makes no sense to say we could have been each other.

¹ [I.e., the self is consciousness. And insofar as other animals can be said to have a self (which they can to the degree that they’re self-conscious), it, too, is their consciousness.]

It's true that things get more complicated when you bring other types of animals into consideration, since their "form" of consciousness is different from ours, in being less self-conscious. They have less of a self. Nevertheless, insofar as they are conscious, yes, Plato's statement has some sense.

*

One of the many sources of instability in the world today is the immense surplus of labor. Hundreds of millions of people who don't have an integral economic role. There are two primary ways of dealing with this reserve army: either absorb it by giving it things to do, or repress it. Since the 1990s, China's main strategy has been to absorb it (through infrastructural projects and so forth);¹ the U.S.'s has been to repress it (and to give it meager welfare benefits). Neither of these strategies will prove sustainable for a long time, though. Keynesianism cannot last for many decades anymore, and repression will eventually face insurmountable resistance. Both strategies will start to meet their limits in the next ten years or so, though the repressive option will continue to be used for a very long time. Things are about to get interesting....

*

Some varieties of "eliminativism" still intrigue me. Is there really a fact of the matter about whether I admire Occupy Wall Street activists? Even if I say I do, and even if in the moment I say it I believe it, do I? Maybe half-consciously I'm just saying it because I know the other person will appreciate my statement. What is it to "admire" someone anyway? Or to hate someone or have contempt for him or love him or respect him? In one moment you say you hate him; in the next you correct yourself and say you only dislike him; in the next, you say that, well, okay, he's not acting in malice and he means well, and maybe you just pity him. What the hell! There's no "reality" here! You're just talking. And yet there is *some* mental state, some vague sort of attitude toward the person in question, backing up your talk. But the mental state isn't "determinate" in any way. It's just a sort of nebulous disapproval coloring your thought of the person. Most of the intentional content is in your words, not in your mind itself. The role of your mind is just to assent to the words coming out of your mouth in the moment you say them. So to return to the question about whether there is an underlying "fact of the matter," I guess all that can be said is that my attitude toward OWS activists is such that I'm fairly comfortable *saying* I admire them. But then you retort, "Do you *really* admire them, though?" Um, yeah, I guess. But you know, these kinds of words themselves don't have very determinate meanings, and the more you dig into them, the less there is. I don't know what the broader lesson is.... It's possible, too, that I'm conflating several issues.

Maybe part of the puzzle I'm groping at is that universals like 'admire' seem as though they should have an "essence," a determinate, substantive meaning, whereas often they don't. There's an incongruity between the impressive-sounding universality and apparent determinacy of 'admire' and the lack of a comparable referent in my mind, as well as, once you investigate, the lack of real determinacy in the concept itself. It's not determinate in the way that 'bachelor' is.

*

Some Marxists criticize Robert Brenner's book *The Economics of Global Turbulence* for its focus on inter-capitalist competition rather than the class struggle between workers and capitalists, as well as for seeming to deprive workers of agency. They argue that it portrays the class struggle as not very important in determining systemic trajectories. Since I'm sympathetic to Brenner's perspective, you might criticize me in the same ways. But of course both Brenner and I acknowledge that class struggle is absolutely essential to the dynamics of capitalism. Capital's need to exploit labor and labor's interest in resisting are foundational facts about society. Nevertheless, capital obviously has more power than labor, more influence, and to that extent a theorist who wants to explain historical trajectories should focus more on the

¹ Needless to say, repression hasn't been absent.

operations of capital than of labor. Whenever labor has made significant advances, after all, it is because it has had allies in the propertied classes. (Just consult history.) And in an era like that of neoliberalism, when labor is staggering under ferocious attacks, the agency of capital is especially decisive to social evolution. Labor has become even more “reactive” than it used to be. Brenner’s emphasis, therefore, is not misplaced.

*

Anti-ressentiment.— What I most resent people for is their *smallness*, because it makes me think that life itself is small.

*

After seeing a talk by Glenn Greenwald, it occurs to me that Hannah Arendt’s classic definition of totalitarianism is starting to apply, at least in a very approximate way, to the U.S. That’s starting to be the *ideal*, the ideal of power-structures. It’s the logic of their policies, though fortunately it will never be realized. The surveillance and “national security” state—the police state—is doing all it can to make impossible human interactions that aren’t mediated or at least observed by power. Several billion hours of surveillance tape are produced *every day* around the country, and that amount is increasing. The NSA apparently has intercepted and stored about *twenty trillion* emails in recent years. Drones are being deployed to spy on the domestic population. (Historically, militaristic experiments abroad are often used on the domestic society after they have been perfected. Impoverished foreign countries are the laboratory.) Cyberwarfare is becoming more sophisticated, eventually to be used on leftist groups among the citizenry. The tactic of instilling *fear* among people, intimidating them through police brutality and so on, is being pursued all across the political spectrum, not only by the right. These are long-term trends that will intensify as the ruling classes sense that they’re losing control over the world.

*

In the past I’ve been hard on Leninism. But I have to admit that it’s an easy thing to caricature. The fact is that Lenin was right about a lot. Theoretically, of course, he was right about *many* things, but even strategically he was right about a lot. It makes some sense to characterize revolutionary activists as the “vanguard,” although if you take this conceptualization too seriously it can lead to a destructive and counterproductive elitism. Understood loosely, a kind of “democratic centralism” is just common sense. For a coordinated movement to work, there’s no alternative. You have to have “executive committees” or whatever you want to call them, and there should be some semblance of unity-of-action. Representative democracy in the executive power. Revolutionary political parties can play a very important role [too]. On the other hand, they shouldn’t be the only manifestations of the movement. Decentralized, “horizontal” networks of economic and political activism are essential as well, to help ensure that things happen from the ground up. Which is the only way to make a durable, successful *social* revolution. A socialist or quasi-socialist political party that takes over the national state before economic relations have made much progress towards socialism might bring about a revolutionary abortion, as happened in the Soviet Union, but less ambitious goals can be achieved or facilitated by the party, for example the popularization of anti-capitalist ideas and the taking of power on more local levels. In short, there is no one path to revolution; a variety of methods, some “Leninist” and some “anarchist,” will have to evolve of their own accord.

*

To understand the character of mainstream America, all you have to know is that it admires the repellent thing called Thomas Friedman. That fact in itself is a sufficient indictment of our entire civilization: it exposes the racist, imperialistic, jingoistic, dishonest, intellectually vacuous, hypocritical, elitist basis of Western society.

*

Chomsky recently wrote an article describing how the rights enshrined in the Magna Carta have been shredded in the last five hundred years. Naturally, in the “Comments” section under the article online are observations to the effect that Chomsky, that horrible Commie, wants to take us back to the year 1215. Etc. An intelligent six-year-old would understand Chomsky’s point(s), but these people can’t. They’ve been indoctrinated into a pre-six-year-old level of intelligence and rationality. They can’t interpret statements from “Commies” except through a fog of “Fuck you.” Virulent hostility toward people who challenge them so colors their mind that they *can’t understand what is being said*. It becomes impossible to consider arguments on their merits; all that really registers (implicitly) in these people’s minds is that “This horrible guy is saying ‘Fuck you!’ to me—his very existence is a ‘Fuck you!’—so I have to defend myself [i.e., my sense of self] by attacking him.” It’s a fascinating phenomenon, which gives clues as to how Nazism and concentration camps are possible. Hatred of the other, whether Commie or Jew or whatever, *consumes the mind*, so that any capacity for lucid reasoning is lost and the other’s humanity is barely recognized. The kind of mind susceptible to this descent into semi-madness must be deeply paranoid, anxiously sensitive, insecure, prone to feeling as if it is beset by all kinds of demons that have to be destroyed. Commies, socialists, Muslims, terrorists, gays, big government, immigrants....the whole world is against me! All these evil forces have to be destroyed! Thus: far-right conservatives.

There’s a continuum, of course; not everyone who hates Chomsky has a thoroughgoing fascist, authoritarian, paranoid mindset. But most have traveled some distance down that road. (Actually, everyone to some extent shares these traits—subtly categorizing certain people and hating them as instances of that category, etc.)

*

On the “vice” of “generalizing.”— My dad recently offered a friendly criticism of me: he said I “always go from the particular to the general” when making judgments about things. So I retorted in an ironical tone that Schopenhauer considered this trait to be the essence of genius. Which, if there’s any truth to that, makes postmodernism the opposite of genius.¹

*

I was watching Conan O’Brien’s late-night talk show; his guest was some beautiful actress. She was wearing a dress that exposed her ample bosom, and at one point she caught him looking down. “*Focus*, Conan [on my eyes, not my breasts],” she said with irritation. Then she laughed, as the audience did. While laughing, she brushed some strands of hair off her right breast, thereby giving Conan and the audience a better view of the two lovely things she’d demanded he ignore a second ago. And it occurred to me that this was a good example of why men, who tend to lack insight, sometimes call women irrational. After all, women tend to contradict themselves more than men do, in different kinds of ways. One of the reasons for that is that Simone de Beauvoir was right in the passage I quoted from her a long time ago: womanhood, as such, is in tension with one’s vocation as a human being. Womanhood means (relative) passiveness, objecthood, a lack of autonomy. So women want to have those qualities even as they also, as human beings, want to be active subjects, strong, and autonomous. They’re torn between the two desires, the two contradictory necessities. Therefore they act in contradictory ways, wanting to be treated like sex-objects but not.²

¹ [Needless to say, there are intelligent and unintelligent ways of “generalizing.” Most people do it unintelligently.]

² There’s also the fact that women, because of hormones, are more innately fickle than men. See the article from the *New York Times* I quoted years ago, about the man who became somewhat like a woman because his testosterone was

This woman's action, incidentally, is also revelatory of the "unconscious intentionality" that infuses many of our actions. She wasn't *thinking* "I want people to have a better view of my breasts" when she adjusted her hair, but the intention was there all the same, unconsciously or half-consciously.

*

One of the many tragedies of life is that everyone, or nearly everyone, has at least one thing at which they excel, one incredible talent. They can enrich themselves and the world by realizing their talents. And yet the *overwhelming* majority throughout human history, so overwhelming that the minority is practically infinitesimal, has not had the opportunity to realize talent, for many reasons. Some of these people were born before society had become sophisticated enough to invent the means for the pursuit of their talent(s); others lived in such a society but were denied opportunities; others were born, lived a few hours, and died. The entirety of what we have lost is the *universe* to the *atom* of what we have.

*

I saw Woody Allen's movie *Midnight in Paris*. A soft haze hung in my mind afterwards. I feel as though that movie was made for me, and I see a lot of myself in the main character, the nostalgic writer. Stranger in a strange land (the present, not the 1920s). Shallowness and mundanity all around....but of course whatever historical era you live in is full of shallowness and mundanity. There was never a golden age. Still, nostalgia—for nothing in particular—stays with me, and with all "dreamers." Nostalgia for something never experienced. And never to be experienced. (True love, however, would be a step in the right direction.)

*

As I get older, I find myself taking consolation in the thought that someday, perhaps, I'll be able to live in Europe. That always remains an option. To leave the desert and live in Italy, France, or Spain, [...].

*

Reading a book (published in 1987) that has the following passage: "...This [politically conservative, private-sector-fixated] perspective misdiagnoses the causes of current economic maladies, principally because of its uncritical devotion to market forces. High taxes, costly governmental regulations, excessive wage demands by unions, and an overly generous welfare state are viewed as the primary culprits. Yet this perspective is unable to explain why Sweden, Japan, and virtually all of the U.S. major trading partners in Western Europe have enjoyed greater levels of productivity growth than the United States despite higher taxes, greater government and union involvement in management, more generous welfare policies, and more equal distributions of income." The point is valid. *Planning*, as was done for a long time by Japan's Ministry of International Trade and Industry, is usually more effective than unregulated private competition. (In fact, to some extent it's absolutely necessary.) Intelligent government investment in the economy, funding long-term projects such as technological innovation, infrastructure development, and expanded public education, has for at least eighty years been a sine qua non of sustained economic growth. Many of the economic woes of the U.S. since the 1970s could have been avoided had the government pursued radically different, quasi-state-socialistic policies. But that couldn't have happened without, first, radical changes in the class structure.

In the absence of those changes, it was reasonable for the corporate sector to pursue Reaganite policies as means, in the long run, to speed up the growth of productivity and increase profits, as finally

being suppressed. But really you don't have to "see" any article; just get a girlfriend, or be a woman, and you'll appreciate the truth of the stereotype. Unless you've been blinded by feminist propaganda.

began to happen in earnest—after decades of attacks on the Keynesian welfare state—during the 1990s. Of course this corporate class war has left millions of people in the ditches, but it has ensured that economic growth in some narrowly defined way has occurred. The choice was between the neoliberal strategy and a progressive statist one, and the latter was precluded by the balance of class forces.

But even if alternative, radically progressive policies had been enacted, in the long run the golden age couldn't have lasted. "Limits to capital accumulation" would have kept cropping up, and eventually the system would have descended into stagnation and crisis. A world economy structured around competition for profits is, in the end, doomed.

*

It's ironic that the men who take women most seriously, the ones who try to understand them on the deepest level, are considered more "misogynistic" than the men who ignore them [i.e. their minds] and don't care about understanding them. Liberals and far-leftists don't go very deep with regard to female psychology; they simply assert that women should be equal to men in politics and the economy (as they should), and then move on to other topics. Or they rant about how men and women are the same. This behavior itself expresses misogyny, a total lack of interest in the differences between women and men, a lack of interest in women and what moves them. The moment you start to pay attention to women and investigate their desires, you're declared a misogynist or a sexist. If you don't believe that women are exactly the same as men—i.e., that maleness is the standard of all value—you're a sexist. If you respect human diversity, you're a sexist. Undoubtedly there are obnoxious, chauvinistic ways of paying attention to women, but the mere fact of being "chivalrous"—as all decent men are, often in imperceptible ways—or of being interested in women as women, is not objectionable. It is treated that way, though. The tyranny of political correctness will cast you out if you show a hint of intellectual honesty or interest in female psychology. That's the sad world we live in. The *truly misogynistic* world.

*

Why is deindustrialization bad for the economy (or society)? This question should be taken seriously, though it rarely is. A lot of mainstream economists actually argue that there's nothing wrong with a decline of employment in manufacturing, that it's a sign of progress, in particular of the higher productivity in manufacturing than in the service sector. Manufacturing productivity in America has become so high that we need very few workers to produce an equivalent level of output to the 1960s. The employment lost in manufacturing can be compensated by higher employment in the services. Etc. There is some superficial plausibility to this view, but a bit of sensible thinking shows it to be false. The main problem with losing manufacturing employment, I suspect, is that it entails a loss of powerful unions, thus a loss of high wages in the core economy (the "standard-setting" economy), therefore a stagnation or decline in the standard of living and a shrinking of effective demand. With lower demand, the service sector can't grow sufficiently to stably employ the tens of millions who would have had manufacturing jobs if the industrial sector had continued to grow instead of shrink. Said differently, the basic problem seems to be that it's harder to unionize in services than in industry, because of the greater incidence of part-time and informal employment, the fragmentation [and "personalization"] of the sector, the lack of standardization in work processes, the transitory nature of employment, etc. Furthermore, since it is inherently more difficult to raise productivity in the services than in manufacturing, it's more difficult for wages to rise indefinitely—at least in "mass" jobs like retail and clerical work. There isn't a constant stream of inventions permitting greater output that raises the possibility of higher wages. Also, manufacturing jobs supposedly generate more secondary jobs than those in the service sector do. On top of all this, there is the obvious fact that problems of "transition to a new economy," the "temporary" problems of inadequate training for new well-paying jobs, are by no means insignificant, especially in a country that devotes few resources to properly training laid-off workers for new careers. Conceivably, deindustrialization in the U.S. did not have to be the agonizing process it has been, if tens of billions of dollars had been directed to programs of

“retraining,” i.e. *education*. But that couldn’t have happened in a country with the class structure of the U.S. It wasn’t to the advantage of the financial sector—or real estate, insurance, retail, entertainment, or energy corporations.

[Another thing to keep in mind is that deindustrialization has coincided with a major increase of capital mobility, which has changed the power dynamics between capital and the population. Even apart from its contribution to deindustrialization, this greater mobility bears a lot of the blame for the dramatic rise of economic insecurity since the 1960s. It surely helps keep service-sector wages low, for one thing; and even if there were still a lot of manufacturing jobs in the U.S., high capital mobility would probably ensure that unions had little power and manufacturing wages were low. But of course deindustrialization itself can be attributed in part to high capital mobility (in a context of competitive pressures on a national and international scale).]

*

August

The history of the American city is worth knowing. Marxists usually divide it into three stages: the commercial city, the industrial city, and the corporate city, corresponding to the successive phases of commercial capital, competitive industrial capital, and corporate or monopoly capital. The commercial city, which lasted until the middle of the nineteenth century, was a center for trade, craft manufacturing, and mercantilist government. Its residential structure was relatively heterogeneous and not as segregated as it would become later: “People of many different backgrounds and occupations were interspersed throughout the central city districts, with little obvious socioeconomic residential segregation. In the central port districts, the randomness and intensity of urban life produced jagged, unexpected, random physical patterns. Streets zigged and zagged every which way. Buildings were scattered at odd angles in unexpected combinations.” The only group that didn’t share in this central port-district life was the poor—beggars, casual seamen, propertyless laborers—who lived outside the cities in shantytowns and rooming houses, moving from town to town. As the commercial city grew, the only major change that took place in its organization was the rationalizing of land speculation, the birth of the “urban grid” characterized by straight lines, ninety-degree angles, etc.

Early factories were located in small towns, but after a few decades they had moved to large cities. Why? First of all, they provided easy access to markets, workers, transportation, and intermediate goods. In other words, cities provided “agglomeration economies,” as conventional economics calls it. David Gordon also suggests that, at least until the 1880s, it was easier for employers to control their workers and suppress resistance in large cities than in small ones. The reasons, he says, are that, “first, the greater physical segregation and impersonality of the larger cities seem to have isolated the working class and exposed it to community indifference or ostracism [which was very different than in small cities, where the middle classes often supported workers’ strikes]. Second, non-industrial classes in smaller cities seem to have exhibited more militantly preindustrial values [such as human decency and fair pay] than their larger-city cousins.” In short, “the basis for industrial profits was best secured if and when a homogeneous industrial proletariat could be most effectively segregated from the rest of society,” which was more feasible in large than in small cities.

Huge factories were concentrated in downtown industrial districts, near rail and water outlets; segregated working-class housing districts emerged, located near factories; the middle and upper classes began to escape from the unpleasant center city, eventually being “arrayed in concentric rings” around the center; shopping districts arose in the heart of the city to cater to the more prosperous classes. The differences from the earlier commercial city are clear. “The central city was [now] occupied by dependent wage-earners rather than independent property-owners. Producers no longer lived and worked in the same place; there was now a separation between job and residential location. There was no longer residential heterogeneity; instead, the cities had quickly acquired a sharp residential segregation by economic class. In

the Commercial City, the poor had lived outside the center while everyone else lived inside; now, suddenly, the poor and working classes lived inside while everyone else raced away from the center.”

Problems—for capitalists—began to appear in the 1880s and later. The most important one was that as workers became more and more concentrated in large cities, labor unrest grew harder to suppress. Strikes bred demonstrations throughout the downtown districts. At the turn of the century, as the merger wave took off and monopoly capital entered the historical arena, manufacturing started moving out of the central city in search of more stable and secure environments (and lower taxes). Factory districts beyond the city limits cropped up, such as Gary, Indiana and East Chicago. Thus “the great twentieth-century reversal of factory location” began, because—at least in part—“corporations could no longer control their labor forces in the central city.”

At around the same time, especially from the 1920s on, central business districts were created and expanded. “Downtown office space in the ten largest cities increased between 1920 and 1930 by 3000 percent. Tall skyscrapers suddenly sprouted...” Why did it take until the 1920s for central business districts to flower? Apparently because “large corporations were not yet ready for them before then. Huge corporations had not consolidated their monopoly control over their industries until after World War I. Once they gained stable market control, they could begin to organize that control. They were now large enough to separate administrative functions from the production process itself, leaving plant managers to oversee the factories while corporate managers supervised the far-flung empire.” They chose downtown locations because of agglomeration economies (the advantages of being near other headquarters, banks and law offices, advertising agents). Incidentally, Daniel Burnham’s 1909 *Plan of Chicago* proves that even at that early date, the commercial business community was preparing for a “post-industrial” future. It’s a strikingly modern plan, prioritizing urban beautification, the development of highways, new parks, railroad terminal improvements, civic and cultural centers, a more systematic arrangement of streets, and the gradual eviction of industry from the central city by means of zoning regulations and the increase of land values. The plan was partially implemented in the following decades.

Another major change that began with the transition to corporate capitalism was the political fragmentation of urban areas, i.e. the rise of “political suburbanization.” A sort of primitive suburbanization had already been going on for quite a long time, but until the end of the nineteenth century, central cities had continually annexed outlying residential districts. Suburban residents usually opposed this, preferring autonomy, but they couldn’t do much about it. Until the turn of the century. The last urban annexations [in *old* cities at least, not newer ones like Los Angeles] happened between 1890 and 1910. The reason for this cessation of annexation activity, it seems, was that the power dynamics changed: as manufacturers themselves began to move out of central cities, legislatures and local governments were prevailed upon not to allow the annexation of suburban areas by cities. (What the manufacturers wanted was to avoid paying central-city taxes and to stay outside the purview of progressive city legislation.)

Gordon concludes his analysis:

If a city had reached maturity as an Industrial City during the stage of industrial accumulation, its character changed rapidly during the corporate period although its physical structure remained embedded in concrete. Its downtown shopping districts were transformed into downtown central business districts, dominated by skyscrapers.... Surrounding the central business district were [eventually] emptying manufacturing areas, depressed from the desertion of large plants, barely surviving on the light and competitive industries left behind. Next to those districts were the old working-class districts, often transformed into “ghettos,” locked into the cycle of central-city manufacturing decline. Outside the central city there were suburban belts of industrial development, linked together by circumferential highways. Scattered around those industrial developments were fragmented working-class and middle-class suburban communities. The wealthy lived farther out. Political fragmentation prevailed beyond the central-city boundaries.

Many other, newer cities—particularly those in the South, Southwest, and West—reached maturity during the stage of corporate accumulation. These became the exemplary

Corporate Cities. They shared one thundering advantage over the older Industrial Cities: they had never acquired the fixed physical capital of an earlier era. They could be constructed from scratch to fit the needs of a new period of accumulation in which factory plant and equipment were themselves frequently predicated upon a decentralized model. (Orthodox historians explain the decentralization of manufacturing as a *result* of this new plant and equipment [which includes trucks, cars, and highways, presumably]; I have argued that an eruption of class struggle initially prompted the decentralization and, by implication, that the new plant and equipment developed as a result of that dispersal in order to permit corporations' taking advantage of the new locational facts.) There was consequently no identifiable downtown factory district; manufacturing was scattered throughout the city plane. There were no centralized working-class housing districts (for that was indeed what capitalists had learned to avoid); working-class housing was scattered all over the city around the factories. Automobiles and trucks provided the connecting links, threading together the separate pieces. The Corporate City became, in Robert Fogelson's term, the Fragmented Metropolis. No centers anywhere. [Los Angeles is the classic example.] Diffuse economic activity everywhere.

By the way, mass suburbanization and deindustrialization would have happened earlier if the Great Depression and World War II hadn't intervened.¹ –What an irony that the historic victories of the CIO happened only twenty or thirty years before deindustrialization truly got underway and started to destroy the power of unions! (Whereas earlier in the century, decentralization of production was impelled by the desire to escape labor unrest, in the postwar period it was impelled largely by the desire to escape the power of unions. In both cases, class struggle explains the shift.)²

The urban crisis between the 1960s and 1980s was a crisis of the “old cities,” the old industrial centers like Chicago and New York, not the new cities in the South and West. The Great Depression and World War II saved the old cities for a time, but eventually they had to succumb to declining tax revenues (from white flight and deindustrialization)³ and increasing expenditures due to social problems. So, some of them nearly went bankrupt, and all of them were economically restructured from the 1970s to the present. They were made more “corporate,” more services-oriented, and recently more touristy, like cities all over the West [indeed, the whole world]. Even the “new” cities that initially avoided the urban crisis have recently been losing jobs, this time overseas (as capital mobility has increased). So they too have had recourse to things like tourism, entertainment, urban beautification, and the FIRE sector (finance, insurance, real estate). The so-called “neoliberal city” is really just the post-industrial city in a context of hyper-globalization. It is the latest, and probably the highest, form of the “corporate” city.⁴

It's also interesting that with the acceleration of gentrification, which is a very conscious *policy*, more middle- and upper-class people are returning to the city and lower-income people leaving it for the suburbs. Property values are rising, forcing many immigrants and minorities to move out to the suburbs where they can afford to live. City governments encourage this because higher property values mean higher taxes, in addition to a better “reputation” in the global competition to attract business. Needless to say, plenty of city neighborhoods remain in dilapidated, gang-ridden condition; their number is declining,

¹ Patrick Ashton notes that in 1929 the population of suburbs was growing twice as fast as that of central cities. In 1900, about 10 percent of the U.S. population already lived in suburbs.

² It's true that other factors were operative too. Another author writes, “The growing scale of [industrial] operation discouraged central location where land was scarce. The wave of mergers around the turn of the century created giant bureaucratic empires which needed headquarters in which to coordinate their far-flung operations. Thus office activities began crowding out manufacturing from the central business districts....”

³ Remember, too, that from the 1930s on, federal policies effectively subsidized the expansion of suburbs, because they were very good for capital.

⁴ [Well, the term “neoliberal city” is half-meaningless. It conceals different forms, the evolution of the city from the 1980s to the present and beyond. Cities are going to become more militarized and privatized, for example.]

though. Logan Square, where I live, wasn't the safest of areas eight years ago, but it's gentrifying at a rapid pace. Soon some of the Hispanics who live on my block might have to move elsewhere.

Nancy Kleniewski has a good paper on postwar urban renewal in Philadelphia. But much of what she says applies to cities all around the country. For example, in Chicago too (under Richard J. Daley and later), "urban renewal stimulated investment in the central city, it bolstered the values of central city property, it spurred the transformation of central [Chicago] from an industrial city to a corporate city, and it initiated a change in the composition of the population living in and near the central city...from predominantly industrial working-class, unemployed poor, and racial minorities, to predominantly white, middle- to upper-middle-class and professional." The poor whose homes had been demolished were shunted off to public housing or to increasingly crime-plagued neighborhoods farther away from the central business district.

Reading *Capital Resurgent: Roots of the Neoliberal Revolution* (2004), by G. Duménil and D. Lévy, well-known Marxists. They follow the common Marxist line—which seems right—that neoliberalism was largely a response to the decline in the rate of profit in Europe and the U.S. between the late 1960s and the 1980s. There was a "structural crisis" that demanded that capital owners go on the offensive. The economic crisis coincided, more or less, with a political crisis, a "crisis of democracy"—too much democracy—which gave extra urgency to the capitalist offensive of the 1970s and 1980s.

Why did profitability decline? Supposedly because capital productivity declined, i.e. because "unfavorable conditions for technological change appeared in the 1960s or even earlier." Increasing masses of capital were required to improve labor productivity. I'm skeptical of this sort of technological determinism, especially because they simply declare that technological progress got harder somehow and don't explain it. I'm more sympathetic to Brenner.

They make a number of interesting observations, backed up by detailed data and graphs. For example, in the 1980s and 1990s, large proportions of the capital of nonfinancial corporations were paid out in interest and dividends, at the expense of "retained profits."¹ The state has come to the aid of corporate profitability, though, partly offsetting dividend and interest payments by reducing corporate taxation. Attacks on labor, too, have raised profits. Nevertheless, the profitability of financial companies has soared at the expense of nonfinancial companies.

The authors' "technological determinism" extends to their treatment of the past.

The decades that we have just lived through and the trends that emerge recall the crisis that struck the main capitalist countries a century ago and the way in which it was overcome. The underlying circumstances for the emergence of these two structural crises are very similar. The last decades of the nineteenth century were marked by a development of technology and distribution à la Marx, with a decline in the profit rate similar to the one preceding the structural crisis of the 1970s. At the root of this movement are the rates and forms of technological change. Such change has a particular feature, linked to mechanization, which is central in Marx's analysis: the resorting to very large investments in big masses of fixed capital, buildings, and machines. In such a context, the savings on labor required by production, that is, the rise in labor productivity, demand ever-increasing masses of capital—far more machines, or more expensive machines, for less labor.

As capital productivity thus declined between the 1870s and 1890s, so did the profit rate, from 26 percent to 13 percent. At the same time there was a "crisis of competition." "Companies facing a lowering of their profitability sought salvation through reciprocal agreements, whose purpose was to protect them from the hardships of competition... Some companies agreed to fix minimal prices with each other or to share markets and profits (as in pools)." Later, around the turn of the century, came the great wave of mergers.

¹ Interest rates decreased later in the 1990s, but dividend payments remained high.

Low capital productivity was, supposedly, finally overcome by the “tremendous technological and organizational revolution...known as the managerial revolution.” Taylorism, the assembly line, huge staffs of executives and employees, etc. The assembly line, for example, led to greater gains of efficiency and productivity than previous innovations had. And so the profit rate gradually recovered.

One indication that there’s something wrong about the authors’ interpretation of “structural crises” is that, in 2004, they suggest that the post-1960s crisis may be nearing its end, because capital and labor productivity are recovering and overall profit rates are high. Events since 2004 have shown that high productivity is perfectly compatible with long-term, structural economic problems. The real essence of the latter (at least since the 1970s) must lie elsewhere, then—probably in system-wide overproduction and/or underconsumption.

Another obvious problem is that after the supposed end of the first crisis, the Great Depression happened. Productivity plunged. And yet Duménil and Lévy claim that the Depression was located right in the middle of a long upswing between the early twentieth century and the 1960s. Their way out of the paradox is interesting, but I don’t think I find it convincing. What they say is that, yes, productivity began to improve with the managerial revolution and Taylorism, but these improvements didn’t spread to all firms in the [American] economy. Initially only large, innovative corporations benefited from them. Many small, traditional companies “never acquired the size necessary to reform their management and to adopt more effective technologies; they were never chaperoned by finance,” unlike the large companies that adopted progressive technologies and managerial structures. Automobile manufacturing provides an example of this “heterogeneity” of production in America: “numerous small production units, using obsolete methods, survived next to the giants (Ford and General Motors).” As long as business was prosperous, during the 1920s, the backward sector was able to survive, in part by going further into debt. But when the economy entered a significant recession in 1929 (which wasn’t yet a depression), bankruptcies increased, debts remained unpaid, the banking system was shaken, and so on.

There was a second element of instability: the currency and financial system wasn’t sufficiently regulated. In fact, it was “out of control.” These two sources of instability combined to transform the 1929 recession into a depression.

This analysis suggests that, theoretically, the Depression could have been avoided.

Action could have been taken on two levels. First, with regard to the underlying conditions for the crisis, two types of interventions were necessary. On the one hand, the backward sector should not have been allowed to benefit from passive protection [through antitrust legislation and other things], but should have been helped to transform itself; otherwise it had to disappear. On the other hand, the development of monetary and financial mechanisms should have been accompanied by the definition of a centralized, state framework of control of the stability of the macroeconomy, largely autonomous from private finance. This would mean the establishment of the institutions required by a true monetary policy, targeted to economic activity instead of to the narrow interests of finance. Second, in the crisis itself, business should have been strongly supported and on a lasting basis through credits as well as through public demand (deficits)....

In other words, the maturation of state capitalism should have happened sooner than it did (which was during World War II).

What is most striking in the analysis of the Great Depression is that it is possible to see in it the crisis of the end to the structural crisis of the final years of the nineteenth century. The crisis at the end of the century had led to the development of a new configuration of the production system, that of big joint-stock companies, with unprecedented efficiency; it had prompted the rise of a financial system [the Federal Reserve, etc.] far different from the preceding one, and strongly tied to the production system.[B]ut these evolutions were not coupled with appropriate procedures of macroeconomic control. In spite of the

pronounced heterogeneity of the production system, this period was characterized by the particularly favorable evolution of the major variables involved in the description of technological progress (labor and capital productivity), which extended to equally favorable movements concerning distribution [really?], wages [really?], and the profit rate. The Great Depression intervened in this context in disconcerting fashion—favorable development on the one hand, depression on the other. But this paradox is only apparent—that is what is expressed in the notion of crisis of the end of the crisis.

Interesting ideas that have some validity, but I think Richard Du Boff has a better interpretation in his insistence on *insufficient demand*, which Duménil and Lévy virtually ignore throughout their book. Surely *that*, together with overproduction (excessive competition, therefore cost-cutting, therefore low demand), has typically been the overwhelming problem with capitalism.¹

Something I'm more inclined to agree with is the authors' argument that neoliberalism represented, in part, the restoration of owners' power over managers, the subordination of the latter to the interests of shareholders. In the postwar era managers had been relatively autonomous, able to pursue long-term growth at the expense of short-term profits. This was, in a way, the logical culmination of the earlier managerial revolution. But after the 1960s owners asserted their rights, and capitalism became quintessentially capitalist again. In other words, all the evils that had been mitigated after World War II returned.

Now I'm reading David Graeber's massive *Debt: The First 5000 Years* (2011). "This book is a history of debt, but it also uses that history as a way to ask fundamental questions about what human beings and human society are or could be like—what we actually do owe each other, what it even means to ask that question."

It really is striking to what extent human life revolves around debt, even in the narrow sense (as opposed to the general idea of owing something to someone or having obligations). "For most of human history—at least, the history of states and empires—most human beings have been told that they are debtors.... As the great classicist Moses Finley often liked to say, in the ancient world, all revolutionary movements had a single program: 'Cancel the debts and redistribute the land.' Our tendency to overlook this is all the more peculiar when you consider how much of our contemporary moral and religious language originally emerged directly from these very conflicts. Terms like 'reckoning' or 'redemption' are only the most obvious, since they're taken directly from the language of ancient finance. In a larger sense, the same can be said of 'guilt,' 'freedom,' 'forgiveness,' and even 'sin.' Arguments about who really owes what to whom have played a central role in shaping our basic vocabulary of right and wrong." Some of the most exalted spiritual ideas derive from lowly economic practices. (Cf. Nietzsche too.)

"Christ the Redeemer." As Graeber says later in the book, "The primary meaning of 'redemption' is to buy something back, or to recover something that had been given up in security for a loan; to acquire something by paying off a debt. It is rather striking to think that the very core of the Christian message, salvation itself, the sacrifice of God's own son to rescue humanity from eternal damnation, should be framed in the language of a financial transaction." He also remarks, in the context of discussing *The Genealogy of Morals*, that Nietzsche's "description of Christianity—of how a sense of debt [to God] is transformed into an abiding sense of guilt, and guilt to self-loathing, and self-loathing to self-torture—all of this does ring very true." I agree. The sense of debt is absolute, because God has redeemed us from our original debt (Adam's sin, I guess?) by sacrificing his own son—which surely, in a way, puts us in even *more* debt to

¹ Even in the "monopoly" stage of capitalism competition can be very sharp. Think of the history of the U.S. meatpacking industry in the 1950s and 1960s. Or the international economy since the 1970s. Or, in general, the decentralization (suburbanization, ruralization, off-shoring) of industrial production in the U.S. throughout the twentieth century, undertaken because of competitive pressures.

him!¹ We're totally unworthy of God's love, but love us he does, thereby permitting us to be saved and go to heaven.

Maybe a better way to interpret it than in terms of debt is to say that Christ "redeems" us from the "other side," from sin and the devil—he buys us back for God by sacrificing himself. It isn't that we want to escape our debt to God; we're always in infinite, everlasting debt to him. But Christ's love for us convinces God to accept us into the kingdom of heaven. Or something like that. Christianity is incoherent, so it's hard to make sense of it.

Anyway, the first myth Graeber attacks is the conventional Smithian idea that societies evolved from barter to money (cash) to credit. The reverse is closer to the truth. For most of history, economic transactions have been organized by keeping an "account," i.e. on credit, which might be measured according to some unit of currency even though that currency (as cash) doesn't actually circulate or is very rare. In other words, money served as a unit of account rather than a means of payment or store of value.² Barter did happen, but usually between societies (tribes or whatever) that were enemies or strangers and came into brief contact. *Within* a society, no, it was rare. In comparatively recent times, cash has become a widespread means of payment; and barter has typically happened in societies where cash has been used but for some reason is not widely available at the moment. Russia in the 1990s and Argentina around 2002 are examples—both resulting from the failures of capitalism! Ironic.

"No example of a barter economy, pure and simple, has ever been described, let alone the emergence from it of money; all available ethnography suggests that there has never been such a thing."

Another myth coming from Adam Smith is that states and markets are radically opposed. This, too, is false. From ancient times, states have used tax policies to create markets. (By forcing people to pay taxes in cash, governments effectively force them to participate in the market (in order to get cash).) Conversely, "stateless societies tend also to be without markets." The reason governments imposed markets and coinage on their subjects—coinage was invented between 600 and 500 B.C. in China, India, and Greece—is mainly that that made it much easier to provision large standing armies, which arose around the same time.

Returning to Nietzsche for a moment...I have to agree with Graeber (and Georg Lukács and other Marxists) that in many respects his thought is little but a radicalization of the bourgeois tradition. As in much of *The Genealogy of Morals*, and more generally in his viewing life as an arena of competition, a struggle between the weak and the strong and between all individuals, a series of expressions of the will to power. His is an atomistic vision, a world stripped almost bare of human solidarity—although it's true he interprets society as a struggle between *racés* too. A singularly bourgeois notion, perfectly compatible with capitalist structures. He's kind of like La Rochefoucauld, determined to strip human relations of all "sentimentality," as capitalism itself does. His psychologism and idealist tendencies are also bourgeois, "decadent." It's ironic but telling that postmodern thinkers consider him more radical than Marx. (Postmodernism as a movement is but a decadent expression of a certain stage of bourgeois society, of corporate capitalism in its age of greatest atomism.)

To say, as Nietzsche does, that the feeling of personal obligation "has its origin in the oldest and most primitive personal relationship there is, in the relationship between seller and buyer, creditor and debtor," is silly. "Here for the first time," he continues, "one person moved up against another person, here an individual *measured himself* against another individual.... Selling and buying, together with their psychological attributes, are even older than the beginnings of any form of social organizations and groupings..." It's the old bourgeois fantasy that the state of nature is atomistic, that commercial or contractual relationships precede any others.

¹ How is God's sacrifice of his son supposed to redeem us? It makes no sense. If anything, it makes us even more puny and worthless compared to him. Or maybe the point is that God's love for us proves we must have *some* kind of value, at least in his eyes.

² Most gift economies apparently haven't used money even in this sense. They have simply established a system of ranked categories of things that were roughly equivalent to one another, such as pigs and shoes. One could give one in return for the other (though there was usually a time-differential, so it wasn't true barter).

It's true that commercial practices and institutions have done much to shape human behavior and thought, but there is a deeper substratum in the mind, in human nature, that has nothing to do with them. Love, compassion, empathy, creativity, curiosity, self-expression. (And other less noble things too.) Nietzsche was surely aware of this, but in his philosophical experimentation he tended to forget it or ignore it.

Anyway, Graeber makes the excellent observation that one of the moral foundations of ordinary life in any society is *communism*, which he defines by the slogan "From each according to his abilities, to each according to his needs." Basically, sharing, helping, and cooperation. "All of us act like communists a good deal of the time." He's trying to get away from the common interpretation of morality and social life in terms of strict reciprocity, "balanced exchange," "fairness," "symmetry," the repayment of debts, etc. According to this theory, which was enthusiastically defended by Levi-Strauss among others, "all human interaction can best be understood as a kind of exchange." (With language we exchange words, with kinship we exchange women, and so forth.) And if that's true, "then debt really is at the root of all morality, because debt is what happens when some balance has not yet been restored." But of course reciprocity (in the strictest sense) is inadequate as a universal foundation for ethics. For example, where is the "reciprocity" in the mother's relationship with her child? No child can ever repay his or her mother. And the law "an eye for an eye," while embodying reciprocity, doesn't seem particularly moral. So Graeber proposes instead, as one of the foundations for social life and morality, a kind of basic communism.

"Baseline communism [as he calls it] might be considered the raw material of sociality, a recognition of our ultimate interdependence that is the ultimate substance of social peace." A sensible view, which would be useful to invoke in polemics against apologists for capitalism.

Partially against Graeber, it seems to me that, in an extended sense, the logic of reciprocity is (and/or should be) at the root of most human interactions. It has to do with respecting others, treating them as you'd like them to treat you, applying to yourself the standards you apply to them, treating them as more-or-less equals. Nevertheless, it's true that *literal* reciprocity is often not applicable, is not even the ideal.

The origins of prostitution and patriarchy are intimately tied to debt. As Gerda Lerner says, "[One] source for commercial prostitution was the pauperization of farmers and their increasing dependence on loans in order to survive periods of famine, which led to debt slavery. Children of both sexes were given up for debt pledges or sold for 'adoption.' Out of such practices, the prostitution of female family members for the benefit of the head of the family could readily develop. Women might end up as prostitutes because their parents had to sell them into slavery or because their impoverished husbands might so use them.... By the middle of the second millennium B.C., prostitution was well established as a likely occupation for the daughters of the poor. As the sexual regulation of women of the propertied class became more firmly entrenched, the virginity of respectable daughters became a financial asset for the family." Various means were used to differentiate respectable from non-respectable women, including the practice of veiling respectable women, which first appeared in Assyria between 1400 and 1100 B.C.

"States seem to have played a complex dual role, simultaneously fostering commoditization and intervening to ameliorate its effects: enforcing the laws of debt and rights of fathers, and offering periodic amnesties. But the dynamic also led, over the course of millennia, to a systematic demotion of sexuality itself from a divine gift and embodiment of civilized refinement [as it had been in Sumer] to one of its more familiar associations: with degradation, corruption, and guilt." Because of its association with debt, poverty, the market, sexual slavery, prostitution.

"'Patriarchy' originated, first and foremost, in a rejection of the great urban civilizations in the name of a kind of purity, a reassertion of paternal control against great cities like Uruk, Lagash, and Babylon, seen as places of bureaucrats, traders, and whores. The pastoral fringes, the deserts and steppes away from the river valleys, were the places to which displaced, indebted farmers fled. [The Old Testament was a product of some of these pastoral rebels.] The extraordinary emphasis we find there [in the Old Testament] on the absolute authority of fathers, and the jealous protection of their fickle womenfolk, were made possible by, but at the same time a protest against, this very commoditization of people in the cities that they fled." Most of the world's Holy Books "echo this voice of rebellion, combining contempt for the corrupt urban life, suspicion of the merchant, and often, intense misogyny." Graeber quotes a denunciation

of Babylon, “the great whore,” in the Book of Revelations, and then comments, “Such is the voice of patriarchal hatred of the city, and of the angry millennial voices of the fathers of the ancient poor.” Fascinating. It’s true that Judaism and Christianity originally represented these interests, although Christianity also represented the poor and oppressed of all kinds. It was a reaction against urban decadence, inequality, and injustice, though it was so broad that it contained conflicting impulses, some authoritarian and some egalitarian. Needless to say, in the long run the authoritarian tended to predominate.

These patriarchal trends ultimately triumphed in all major civilizations, from China and India to ancient Greece. “Between the push of commoditization, which fell disproportionately on daughters, and the pull of those trying to reassert patriarchal rights to ‘protect’ women from any suggestion that they might be commoditized, women’s formal and practical freedoms appear to have been gradually but increasingly restricted and effaced. As a result, notions of honor changed too, becoming a kind of protest against the implications of the market, even as at the same time (like the world religions) they came to echo that market logic in endless subtle ways.”

Let’s skip ahead. To Rome, the decline of the empire. This too was largely a product of the accumulation of debt on the part of huge masses of people. “The works of the early Christian fathers resound with endless descriptions of the misery and desperation of those caught in rich lenders’ webs. In the end, through this means, that small window of freedom that had been created by the plebs [over centuries of struggle] was completely undone, and the free peasantry largely eliminated. By the end of the empire, most people in the countryside who weren’t outright slaves had become, effectively, debt peons to some rich landlord—a situation in the end legally formalized by imperial decrees binding peasants to the land. Without a free peasantry to form the basis for the army, the state was forced to rely more and more on arming and employing Germanic barbarians from across the imperial frontiers—with results I need hardly relate.”

Remind you of anything? Like...the present? The working and middle classes staggering under the burden of debt and unfreedom... The rights won by modern-day “plebs” through decades of struggle are being completely undone, and the civilization is collapsing under the weight of debt and income inequality.

I like Graeber’s quasi-Weberian reflections on the relations between markets and the systems of thought and ways of life that arose in the Axial Age, when coinage, impersonal markets, philosophical systems, and world religions first appeared. It was also an unprecedented time of war, from Greece to China, and of slavery on an enormous scale.¹ “The growth of markets played a role [in the spread of intellectual movements], not only helping to free people from the proverbial shackles of status or community, but encouraging a certain habit of rational calculation, of measuring inputs and outputs, means and ends, all of which must inevitably have found some echoes in the new spirit of rational inquiry that begins to appear in all the same times and places. Even the word ‘rational’ is telling: it derives, of course, from ‘ratio’—how many of X go into Y—a sort of mathematical calculation previously used mainly by architects and engineers, but which, with the rise of markets, everyone who didn’t want to get cheated at the marketplace had to learn how to do... [He refers to] impersonal markets, born of war, in which it was possible to treat even neighbors as if they were strangers.” In archaic “human economies” (as opposed to commercial ones), motives are assumed to be complex, not aiming solely at private profit but relating to all sorts of social needs and desires. Not so with the impersonal market. The notion of “profit” became very common in the Axial Age, as self-interest came to be seen as fundamental. So in China you had Legalism, a kind of Machiavellianism, and in India the materialist school of Charvaka, as well as the inevitable reactions against them in the forms of Mohism, Confucianism, Buddhism, etc. But these were really reactions against all the materialist, selfish ways of life that had emerged with the rise of coinage and markets.

“Axial Age spirituality is built on a bedrock of materialism. This is its secret; one might almost say, the thing that has become invisible to us.” This is evident even in metaphysics, with the materialist systems of Thales and many others. Drawing on scholarship, Graeber even suggests connections between coinage itself and philosophical materialism and dualism.

Here’s his summary of all these ideas:

¹ “Money was needed to pay armies to capture slaves to mine gold to produce money.”

- 1) Markets appear to have first emerged, in the Near East at least, as a side effect of government administrative systems. Over time, however, the logic of the market became entangled in military affairs, where it became almost indistinguishable from the mercenary logic of Axial Age warfare, and then, finally, that logic came to conquer government itself; to define its very purpose.
- 2) As a result: everywhere we see the military-coinage-slavery complex emerge, we also see the birth of materialist philosophies. They are materialist, in fact, in both senses of the term: in that they envision a world made up of material forces, rather than divine powers, and in that they imagine the ultimate end of human existence to be the accumulation of material wealth, with ideals like morality and justice being reframed as tools designed to satisfy the masses.
- 3) Everywhere, too, we find philosophers who react to this by exploring ideas of humanity and the soul, attempting to find a new foundation for ethics and morality.
- 4) Everywhere some of these philosophers made common cause with social movements that inevitably formed in the face of these new and extraordinarily violent and cynical elites. The result was something new to human history: popular movements that were also intellectual movements, due to the assumption that those opposing existing power arrangements did so in the name of some kind of theory about the nature of reality....
- 6) [The impulse emerged] to imagine another world where debt—and with it, all other worldly connections—can be entirely annihilated, where social attachments are seen as forms of bondage; just as the body is a prison....
- 8) The ultimate effect was a kind of ideal division of spheres of human activity that endures to this day: on the one hand the market, on the other, religion. To put the matter crudely: if one relegates a certain social space simply to the selfish acquisition of material things, it is almost inevitable that soon someone else will come to set aside another domain in which to preach that, from the perspective of ultimate values, material things are unimportant; that selfishness—or even the self—are illusory, and that to give is better than to receive. If nothing else, it is surely significant that all the Axial Age religions emphasized the importance of charity, a concept that had barely existed before. Pure greed and pure generosity are complementary concepts; neither could really be imagined without the other; both could only arise in institutional contexts that insisted on such pure and single-minded behavior; and both seem to have appeared together wherever impersonal, physical, cash money also appeared on the scene.

The movements of protest, whether religious or not, that emerged in this era eventually helped achieve great things. “Wars became less brutal and less frequent. Slavery faded as an institution, to the point at which, by the Middle Ages, it had become insignificant or even nonexistent across most of Eurasia.”

The Axial Age. The axis of history.

Given our tendency to glorify the ancient world, it’s ironic that things got a lot better for most people in the Middle Ages. In Europe and India empires collapsed—and even in China, the Han empire fell apart (though it was succeeded by others)—but slavery largely disappeared and religious institutions began to regulate economic activity.¹ Coinage tended to disappear in Europe and India with the weakening of central governments; the use of money solely as a unit of account returned, and economic activity was organized mainly on credit.

“If the Axial Age was the age of materialism, the Middle Ages were above all else the age of transcendence.... Once-subversive popular religious movements were catapulted into the status of dominant institutions.”

A new age began in the mid-1400s in Europe, “with a turn away from virtual currencies and credit economies and back to gold and silver. The subsequent flow of bullion from the Americas sped the process immensely, sparking a ‘price revolution’ [i.e., inflation] in Western Europe that turned traditional society upside-down. What’s more, the return to bullion was accompanied by the return of a whole host of other

¹ Even in the Arab world, where slavery existed throughout the Middle Ages, its horrors rarely compared to those of the Axial Age and later New World slavery.

conditions that, during the Middle Ages, had been largely suppressed or kept at bay: vast empires and professional armies, massive predatory warfare, untrammled usury and debt peonage, but also materialist philosophies, a new burst of scientific and philosophical creativity—even the return of chattel slavery.” Between 1500 and 1650, prices in England increased 500 percent while wages rose much more slowly. In five generations they had fallen to about 40 percent of what they had once been. And the same thing happened everywhere in Europe. The consequent empowerment of bankers, large-scale merchants, and governments led to major changes in the fabric of European society.

September–December

Getting more involved with the ISO and its student representatives on campus. [...] This Chicago Teachers Union strike is kind of exciting; I just got back from a big ISO meeting about it, and this week I’ll go to a few picket lines depressingly early in the morning, around 7:00 or so. I’m still on the bargaining committee of the GEO too, so for the foreseeable future an unpleasantly large chunk of my time will be consumed in meetings.

Here’s part of an informative article by Dean Baker on the U.S. economy:

The mythology of Clintonomics is that Clinton took the hard steps to bring the deficit down. He cut spending and raised taxes. This supposedly shifted the budget from large deficits to large surpluses and led to a booming economy. In the late 90s we had the lowest unemployment in three decades, and we saw real wage growth up and down the income ladder for the first time since the early 70s. There was in fact much here to celebrate.

However, the reality is quite different from the mythology. The reduction in the deficit was supposed to lead to an increase in investment and a fall in the trade deficit. These are the two components of GDP that increase our wealth for the long-term, the former by increasing our productive capacity and the latter by giving us ownership of more foreign assets.

It turns out that the investment components of GDP actually did not increase in the Clinton boom. After we adjust for a technical issue associated with a surge in car leasing in the 90s (leased cars count as investment in the national accounts, purchased cars are treated as consumption), investment as a share of GDP increased by just 1.2 percentage points from their late 80s level.

However, this was more than offset by a 2.2 percentage point increase in the size of the trade deficit. As a result, at the height of the Clinton boom in 2000 these wealth increasing components of GDP were 1.0 percentage point smaller as a share of GDP than in the high deficit 1980s.

Instead, the component driving the economy in the late 1990s was consumption. The stock bubble led to a surge in consumption, which rose by 3.0 percentage points as a share of GDP as savings hit what was at the time a record low.

The problem with this stock bubble boom was that it was destined to go bust. There are a limited number of fools with money. At some point there was no one left to pay billions of dollars for shares of Internet start-ups that didn’t even know how they could make a profit.

This reversed the irrational exuberance that had sent the market soaring. The market tanked and the economy and the budget surpluses went with it. The recession of 2001 was officially short and mild, ending just seven months after it started. However, the picture

was much worse for most people in the country. The economy did not start to create jobs again until September of 2003, almost two years after the official end of the recession.

The 2001 recession was hard to recover from because it was the result of the collapse of an asset bubble, just like the current recession. It is easier to recover from a normal recession, because a typical recession is brought on by the Federal Reserve Board raising interest rates to slow the economy.

Higher interest rates lead people to delay buying homes and cars. This means that when the Fed wants to get the economy going again it can just lower interest rates and spark a surge in home and car buying. That sort of boost isn't possible when the downturn is caused by the collapse of an asset bubble.

When the economy did finally start creating jobs again after the 2001 recession, it was on the back of the housing bubble, which drove growth in the last decade. In effect, we used the growth of one bubble to overcome the wreckage created by the collapse of another bubble, just as an alcoholic seeks to cure one hangover by starting on the next.

There is another important part of the Clinton legacy that is impeding growth. When Robert Rubin became Treasury Secretary in 1995 he pushed a high dollar policy. He put muscle behind this policy with his control of the IMF in setting the ground rules for the bailout from the East Asian financial crisis.

The harsh terms of the bailout led countries throughout the developing world to demand massive amounts of dollars. Their reserves of dollars were an insurance policy to keep them from ever being in the same position as the East Asian countries. This increased demand for dollars pushed up the value of the dollar and led to the massive trade deficits that we have seen in the last dozen years.

We will not be able to get to a sustainable growth path until we reverse the high dollar policy. The dollar has to be pushed down to a level where U.S. goods are again competitive in international markets. This is a central part of the adjustment from the period of bubble driven growth.

In short, the Clinton-era policies sent the U.S. economy on a seriously wrong path. They created an absurd obsession with budget deficits, a pattern of bubble-driven growth, an incredibly bloated financial sector and an unsustainable trade deficit.

That analysis seems too optimistic. The problem with Dean Baker is that he isn't a Marxist; he thinks a "sustainable growth path" is possible. Chris Hedges and Richard Heinberg are more realistic:

The ceaseless expansion of economic exploitation [Hedges writes], the engine of global capitalism, has come to an end. [Um, not quite.] The futile and myopic effort to resurrect this expansion—a fallacy embraced by most economists—means that we respond to illusion rather than reality. We invest our efforts into bringing back what is gone forever. This strange twilight moment, in which our experts and systems managers squander resources in attempting to re-create an expanding economic system that is moribund, will inevitably lead to systems collapse. The steady depletion of natural resources, especially fossil fuels, along with the accelerated pace of climate change, will combine with crippling levels of personal and national debt to thrust us into a global depression that will dwarf any in the history of capitalism. And very few of us are prepared.

“Our solution is our problem,” Richard Heinberg, the author of *The End of Growth: Adapting to Our New Economic Reality*, told me when I reached him by phone in California. “Its name is growth. But growth has become uneconomic. We are worse off because of growth. To achieve growth now means mounting debt, more pollution, an accelerated loss of biodiversity and the continued destabilization of the climate. But we are addicted to growth. If there is no growth there are insufficient tax revenues and jobs. If there is no growth existing debt levels become unsustainable. The elites see the current economic crisis as a temporary impediment. They are desperately trying to fix it. But this crisis signals an irreversible change for civilization itself. We cannot prevent it. We can only decide whether we will adapt to it or not.”

Heinberg goes on to make speculations similar to those in the fourth chapter of my Master’s thesis.

This semester I’m taking an advanced undergraduate course in Irish history. Just for the hell of it. (Also taking the graduate seminar.)

....I’ve decided to rework the book I published a few years ago. Triple its length and take out a lot of embarrassing stuff. It seems to me that my “self-imposed tutelage” has ended, and I’m ready to make a name for myself. After publishing this book I’ll focus on the AK Press one.

The problem is that I have schoolwork to do. Which I have no interest in. How am I going to get through this semester?

Well, I got through it somehow. Here’s a rather pointless paper. I wrote it in a few weeks in November, having spent most of the semester working on my book. My God, the pain of those three weeks!

Neoliberalism on Trial: A History of Tax Increment Financing in Chicago

In a world of continually increasing economic inequality, the subject of “tax increment financing,” or TIF, is of far greater importance than one might infer from its lack of public recognition. This tool of urban policy in the United States, used in 49 states and Washington, D.C., has contributed significantly to rising class polarization in cities and to the accumulation of municipal debt, which has begun to reach crisis proportions since the recession of 2009. As American municipalities grapple with the fiscal crisis of which pundits speak daily, and as social movements are birthed to defend populations against the depredations of fiscal austerity, activists and intellectuals will have to become more familiar with this thing called tax increment financing if they are to influence policy and comprehend The City’s future.

In this paper, therefore, I will review the history of TIF in a single city, Chicago. Its use began under Harold Washington in the mid-1980s, escalated under Richard M. Daley in the early 1990s, and then exploded after 1998. By the early 2000s, Chicago was widely viewed by scholars and journalists as the poster child for what can go wrong with TIF, due to the inequitable, autocratic, and un-transparent ways in which Daley deployed it. As we’ll see, TIF started out under Harold Washington as a relatively democratic and effective tool to encourage development in “blighted” neighborhoods; as its use became more common, however, it was appropriated for the neoliberal project of subsidizing big property developers and siphoning wealth from the lower and middle classes to the upper. This was manifested, for example, in the prosperity and the beautification of the central business district and its environs at the expense of poorer neighborhoods, and in the gentrification of areas near downtown. This history belongs not only to Chicago but to many cities around the country, indeed all over the world. What I describe in the paper can thus be considered emblematic of trends elsewhere and is usefully compared with them.

A great deal of scholarship and investigative journalism has been dedicated to tax increment financing, but I have been unable to find a comprehensive history of the program in Chicago. This paper is admittedly not comprehensive, being too brief, but it does adopt a broad historical perspective apparently absent in the literature. My purpose is to outline a story of neoliberal “declension,” from the popular hopes and democratic stirrings of the Harold Washington years to the corporatizing, polarizing trends of the recent past.

This declensionist narrative is not new even in the “politically neutral” realm of academic writing, but its application to Chicago’s history through the prism of tax increment financing is. A number of scholars of neoliberalism have described how this political-economic system has functioned to redistribute wealth upwards and exacerbate working-class insecurity. The celebrated geographer David Harvey, for example, argues that neoliberalism began in the U.S. in the mid-1970s, when New York City’s fiscal crisis gave investment bankers and their political representatives an opportunity to undo many of the historic achievements of working-class New York by dismantling much of the city’s social and physical infrastructure. Public resources were used to build new infrastructure for finance, legal services, the media, and consumerism, as “working-class and ethnic-immigrant New York was thrust back into the shadows, to be ravaged by racism and a crack cocaine epidemic of epic proportions in the 1980s.”¹ New York City’s investment bankers thus paved the way for a political economy of privatization, the privileging of financial institutions, and “urban entrepreneurialism,”² all of which proceeded in the 1980s and 1990s to conquer not only the U.S. but much of the world.

The contributors to the volume *Spaces of Neoliberalism: Urban Restructuring in North America and Western Europe* (2002) analyze some of the means by which neoliberalism has spread across the world. Jamie Peck and Adam Tickell argue that, given high capital mobility, cities are forced to compete against each other to attract business, by establishing “favorable business climates.” What this entails is deregulation, the undermining of labor unions, and public subsidies to multinational companies. “The serial reproduction of cultural spectacles, enterprise zones, waterfront developments, and privatized forms of local governance” is the natural product of this worldwide inter-urban competition.³ In her contribution to the volume, Rachel Weber argues that tax increment financing is an especially significant manifestation of urban entrepreneurialism, in fact that “by the 1990s, TIF had become the most popular means of financing redevelopment in the U.S.”⁴ That is to say, it was one of the most popular tools of urban neoliberalism.

Two other recent works take dim views of neoliberalism as it has unfolded specifically in Chicago: Paul Street’s *Racial Oppression in the Global Metropolis: A Living Black Chicago History* (2007) and the collection *The New Chicago: A Social and Cultural Analysis* (2006), edited by John P. Koval, Larry Bennett, et al. We’ll return to the latter work below; it consists of a series of essays on seemingly every aspect of “the new Chicago,” including its economic restructuring, the culture and politics of its immigrant populations, the policies of school reform, public housing, the police force, urban beautification, etc. The essays on Chicago’s political economy describe how the city has recently been trying to pursue both the “low-road” and the “high-road” strategy of competing in the world, the first by offering cheap labor, lower taxes, and direct public subsidies to business, and the second by emphasizing research, education, skilled workers, and high wages. As David Moberg says, it will ultimately prove impossible to pursue *both* roads, since the low undermines the potential for the high. But in the wake of deindustrialization—the closing of steel mills and the stockyards, and the decline of printing and publishing, electronics and electrical equipment, apparel, chemicals, fabricated metal products, etc.—the low road, the truly “neoliberal” road, has proven to be the “path of least resistance,” the simplest strategy for attracting global business.⁵

Paul Street, on the other hand, focuses on the tragedies of Chicago’s racial segregation, which has in some ways been exacerbated by the policies of Richard M. Daley. Even during the “booming” 1990s, regression occurred in Chicago’s “overall racial distribution of income, the relative wealth of black and white neighborhoods, and the access of the black poor to public family cash assistance and to affordable housing.” The percentage of blacks who experienced “deep poverty” also got worse. Just between 1999 and

2004, for example, black poverty rose from 28.5 percent to 33.9 percent, compared to a decrease in the white poverty rate by two percentage points. As Street says, “while white and Latino poverty declined in the city between 1999 and 2004, black poverty fell back to its 1989 level, at the nadir of the urban crisis.”¹ As I’ll argue, these levels of inequality are inseparable from the pro-downtown policies Daley has pursued, in particular his inequitable use of TIF.

It’s time, though, that we considered the fundamentals of tax increment financing, before investigating its history in more depth. TIF was born in California in 1952, when the state legislature recognized that the existence of “blighted” areas—“characterized by unsafe buildings, incompatible adjacent land uses, and lack of necessary commercial facilities”—was hurting the quality of life in California neighborhoods.² However, TIF didn’t spread to many states until the 1970s and later, in the midst of the “urban crisis” caused by deindustrialization and white flight from central cities. Federal aid to cities was decreasing around this time from its heights in the 1960s, and municipalities needed alternative means of encouraging development and raising revenue. So some states turned to tax increment financing; for instance, Illinois passed TIF-enabling legislation in 1977. The basic idea behind TIF is that a government subsidizes (re)development out of the higher tax revenue this development makes possible in the future (by raising property values). The way it works is that the assessed value of all the property in a particular TIF district is “frozen” at the time of the formation of the district; for the duration of the TIF, local taxing bodies such as schools and park districts may tax only this frozen property value. The tax revenue from growth (the “increment”) accrues instead to the TIF fund, “to be spent on capital improvements, developer and rent subsidies, job training, and other expenditures meant to spur new development.”³ In Chicago, the mayor is effectively able to disburse these funds as he sees fit, with little accountability or transparency. A TIF district lasts for 23 years in Illinois (though the option exists of extending it to 35); upon its expiration, the taxing bodies again have access to all the property value of that former district.

One potential source of controversy with respect to TIF is already clear: it deprives government bodies of tax revenue from development. If no development would have occurred but for the existence of a particular TIF district, then of course this objection to tax increment financing is baseless. In fact, this “but for” requirement is usually a key criterion for determining whether a given TIF should be established. As we’ll see, however, many TIFs have been created in areas of Chicago that were *already* developing, which means that taxing bodies have unfairly been deprived of a certain amount of revenue. In a time when municipalities and school districts are drowning in deficits, a lack of revenue is no trivial matter.

Later in the paper I’ll return to criticisms that have been made of TIF, in particular by scholars, task forces, and journalists. Now, however, we’ll review the background to Richard M. Daley’s embrace of TIF in the 1990s, focusing on the relatively progressive years of Harold Washington’s mayoralty.

Washington was elected in 1983 on the back of a popular insurgency, an electoral uprising against rule by the “Machine” that had been consolidated by Richard J. Daley and persisted into the 1980s, albeit in a weaker and less efficient form than in the 1960s. Since the 1950s, this political machine had functioned primarily in the interests of Daley’s downtown-⁴oriented “pro-growth” coalition of real estate developers, financial companies, large retailers, and other commercial forces based in the central business district. It was this elite that determined the agenda of postwar urban renewal, which tended to sacrifice the interests of neighborhoods and communities for the sake of downtown revitalization and corporate profits. Popular

resistance to the trampling of neighborhoods' and minorities' rights had been growing in Chicago since the 1960s, and in 1983 it succeeded in electing a black mayor for the first time.¹

The approach to development that Washington adopted is indicated by the title of his administration's 1984 economic plan, "*Chicago Works Together*." On the first page are set out the goals, namely "to create and retain jobs, to rebuild neighborhoods, to renew housing and the City's physical assets, to aid businesses, and to inform and involve the public at every step of the way."² As the plan notes, most of these priorities are new: hitherto, job creation and neighborhood development had been decidedly secondary to growth in the central business district. "Balanced growth" thus became one of Washington's slogans. Equally novel was the emphasis on transparency and public participation, which Washington valued so highly that in the following years his staff grew frustrated with the necessity to get the public's input on decisions about projects. Such a focus on democracy was wont to cause delays.³

"*Chicago Works Together*," which is some sixty pages long, is an extremely detailed and ambitious plan that aims at nothing less than the renewal of Chicago's infrastructure and economy and the halting of deindustrialization. Its goals for 1985, for example, include the creation of over 10,000 permanent jobs (which could stimulate an additional 15,000 more jobs), job training for 12,000 people, the rehabilitation and construction of 6000 housing units, the provision of volunteer architect assistance to neighborhood revitalization projects, the development of a long-term economic strategic plan, the implementation of affirmative action programs, and the provision of technical assistance to 4000 businesses. In the long run, a major goal was to prevent the further erosion of industry in Chicago by establishing "planned manufacturing districts," in which zoning changes from manufacturing to commercial or residential designations would be prohibited. These districts, which continued to be established in the 1990s, turned out to be one of Washington's most important legacies.⁴

The job-creating, worker-empowering, industry-protecting approach of the Washington administration can be contrasted with that of Chicago's commercial business elite as represented by the Commercial Club. In December, 1984 this group published its own economic development plan, entitled *Make No Little Plans: Jobs for Metropolitan Chicago*. Job creation was clearly not its primary goal, but the plan was given its subtitle in recognition of the new political atmosphere fostered by Washington's mayoralty. The Commercial Club's report barely mentioned traditional manufacturing at all, focusing instead on financial services, retail, communications, high-tech industry, tourism, the marketing of Chicago for international business, and in general the creation of a "favorable business climate." What the last point entailed, as the report frankly admitted, were reductions in the costs of workers' compensation and unemployment insurance. Needless to say, this commercial agenda did not receive a very sympathetic hearing by the Washington administration—or, at least, not as sympathetic a hearing as it would later by the second Daley.

Tax increment financing did not figure centrally in Washington's plans. In fact, from 1983 to 1987 (the years when Washington was mayor), only three TIF districts were established. The mayor adhered strictly to the idea that TIF should be used only to help blighted communities, neighborhoods that had little hope of growth without assistance from the government. Accordingly, a TIF district (of six acres) was designated in West Ridge, a relatively impoverished community on the north side of Chicago; another, of ten acres, was designated in the low-income community of Washington Park on Chicago's south side; a

⁴ "*Chicago Works Together*," 1, 5, 11, 12, 14; Rast, *Remaking Chicago*, 116.

third, of 27 acres, was in the North Loop, which was suffering from “decay and obsolescence.”¹ The TIFs in West Ridge and Washington Park provided resources for such things as environmental remediation, demolition, a new retail center, and several other commercial structures for nearby residents; the funds went to “utility relocation, street and sidewalk improvements, security features, traffic signalization, and job training.”² These two TIF districts proved to be quite successful, having generated by the time of their expiration a compound annual growth rate in total property values of 9% (in West Ridge) and 20% (in Washington Park).³

The North Loop TIF was a much bigger affair. The project to redevelop the North Loop already had a ten-year history of setbacks and failures when Washington came to power. A 1984 report by the Washington administration noted that the neighborhood “is not perceived as an attractive or safe area, particularly after office hours. State Street retail sales volumes and the quality of merchandise have fallen, and entertainment and cultural facilities and programming have severely deteriorated.”⁴ Washington was not very enthusiastic about the TIF, being more interested in redevelopment *outside* the central business district, but because of its momentum among the downtown commercial elite, he accepted its inevitability. His administration convinced the city council to approve a tax increment financing arrangement—the city’s first—to raise the necessary funds, and in 1984 the project got underway.⁵ As the Illinois Department of Commerce and Community Affairs reported, “the city [planned] to spend \$283 million on public improvements and facilities in the district, including: purchase of a site for the relocation of the bus station, construction of a below-grade service tunnel linking parts of the areas with Lower Wacker Drive, adjustments to sewer and water lines, street improvements, pedestrian walkways and sewer bank improvements and new or rehabilitated transit stations along the ‘Loop’ elevated transit line.”⁶ As we’ll see, in 1997, under Daley, the TIF was expanded enormously—a move that was of dubious legitimacy, in light of the fact that according to Illinois law TIFs can be established only in areas exhibiting urban blight, which the Loop in the 1990s definitely was not.

Harold Washington died in 1987, just when many of his reforms were starting to become institutionalized. It was a terrible blow to neighborhood and community movements, and to progressive politics in general.⁷ His successor, Eugene Sawyer, was not as charismatic or effective as Washington, and his tenure lasted only until 1989, when Richard M. Daley was elected mayor. At that time there were only eight TIF districts in Chicago, though this would soon change.

From early on, it was clear to political observers that Daley’s mayoralty would be quite different from Washington’s. For one thing, he was the son of the Boss, the first Daley; many feared he would resurrect the Machine of the 1960s and ’70s. More concretely, the sources of his campaign funding indicated what kinds of policies he would enact if elected. While the incumbent Eugene Sawyer got most of his money from individual donations of less than \$1500, Daley received many donations of more than \$10,000, which ensured that he had far more resources than Sawyer and his other opponents combined. Among Daley’s biggest supporters were the city’s top developers, lawyers, traders, and financiers—the downtown

business community, in short. For instance, the law firms Bell, Boyd & Lloyd and Schiff & Hardin were quite generous to Daley, and the construction industry was especially munificent.¹ In the end, he managed to raise \$7 million, vastly more than his competitors.²

Accordingly, after Daley's election in April 1989, newspapers reported that "Chicago's business community is breathing a collective sigh of relief," in fact that it "is beside itself with joy." The business leaders who had financed his campaign expected him to refocus development efforts downtown, make financing easier for city projects, enact policies that would increase real estate values, and in general foster a "cooperative relationship between city government and business."³ Corresponding to business's optimism was the pessimism of constituencies that favored community empowerment. Members of the city's Economic Development Commission, for example, worried that neighborhood development, which had been emphasized by Washington, would wither. Their concerns proved to be well-founded.

Throughout his six terms, Daley's priorities would be largely consistent with those of three powerful business groups: the Commercial Club, the Civic Committee, and World Business Chicago, which was formed in 1999. The latter two were outgrowths of the first, which was founded over a century ago, in 1877. The Commercial Club currently consists of 350 active members, who are all business and civic leaders in the metropolitan area. The most powerful law firms are represented, as are consulting groups, financial institutions, medical centers, and Chicago's universities. Since the club's founding there has been a striking continuity in the interests it represents, as shown by its sponsorship of Daniel Burnham's famous 1909 report *The Plan of Chicago*, which laid out a very modern and post-industrial vision for the city. It prioritized urban beautification, the development of highways, new parks, railroad terminal improvements, civic and cultural centers, a more systematic arrangement of streets, and the gradual eviction of industry from the central city by means of zoning regulations and an increase of property values. This vision has been largely implemented from the 1920s to the present, the Commercial Club providing assistance and guidance at every step of the way. In the 1980s, in the midst of the urban crisis, it formed the Civic Committee—"a smaller group of member CEOs and senior executives from Chicago's leading businesses, professional firms and universities"—to help plan for the region's rejuvenation.⁴ The first product of this new effort was the 1984 study mentioned above called *Make No Little Plans*, which set out a twenty-year (or more) agenda for economic development. After his election, Daley adhered to its services-oriented, post-manufacturing, anti-labor vision much more closely than Harold Washington had.

Given the power of these organizations—including World Business Chicago, which I'll discuss below—as well as the interests they represent, it isn't surprising that Daley essentially adopted their agenda. For example, in *Make No Little Plans*, the Civic Committee and Commercial Club had suggested that the city "renovate Navy Pier to house retail establishments and recreational facilities."⁵ Daley promptly set about doing so, obtaining within a few months of his election \$150 million from the state legislature to modernize the pier.⁶ Soon afterwards he helped organize a \$987 million expansion of the McCormick Place convention complex—another project long favored by the downtown business community, especially developers—and he also announced plans to build a third major airport in Chicago, which developers and other downtown interests had long been advocating.⁷ (This project was never completed.) In addition, he pressed vigorously for a \$775 million trolley system downtown and a \$2 billion casino and entertainment complex, as well as engineering the construction of the \$175 million United Center, a new basketball and

hockey stadium on the Near West Side.¹ Whatever merit these projects had, the point is that their chief advocates belonged to the downtown business elite.

It is true that in these early years, arguably more so than later, Daley was willing to contravene the wishes of property developers. After all, he had the progressive legacy of Harold Washington to deal with, the legacy of community mobilization. In particular, job creation had come to be recognized as a priority, one not always consistent with the prioritizing of high property values. Even developers often pitched their proposals on the politically popular basis of how many jobs they would create. However, political task forces and projections by the city's Departments of Planning and Economic Development sometimes concluded that industrial land-use would create more jobs than commercial land-use (and would contribute more to the Gross Regional Product), which put pressure on the mayor to approve the former rather than the latter. This was the case, for instance, with the Goose Island and Elston Corridor planned manufacturing districts, which had been proposed in the late 1980s. Their advocates, including unions and neighborhood groups, feared that Daley would cancel the projects, but he proved them wrong (due in large part to pressure from his planning commissioner, David Mosen²). Initially hesitant, in 1990 Daley announced that he was reversing his campaign position and would support the Goose Island and Elston Corridor PMDs. The real estate community and the editors of the *Chicago Tribune* were appalled, but with Daley's support the initiatives sailed through the city council.³

In the coming years, as we'll see, the Daley administration continued on occasion to flout the wishes of its core constituency, the downtown commercial sector. This became more difficult, however, as the West's agenda of property development, urban beautification, tourism, entertainment, gentrification in neighborhoods surrounding the downtown, and marketing of cities for global business came to predominate. Much scholarship has demonstrated that Daley grew enthusiastic, indeed passionate, about this kind of urban planning, that he came to see it as his mission to make Chicago a beautiful, global city. As early as 1989, he told an audience, "The city is changing. You're not going to see factories back... I think you have to look at the financial markets—banking, service industry, the development of O'Hare Field, tourism, trade. This is going to be an international city."⁴ Daley and his administration came to the conclusion that in order to reverse the city's economic decline they would have to transform and expand the Loop "through the support of high-density office development and retailing as well as the reintroduction of a substantial downtown population [i.e., 'gentrification']," and through Chicago's repositioning as a global city.⁵

In fact, Daley was not alone in his embrace of this new agenda. All over the U.S., mayors in the 1980s and 1990s pursued economic revitalization by means not of progressive social policies but of downtown gentrification, beautification, and remaking their cities as "tourist meccas."⁶ Dennis Judd notes that "between 1976 and 1986, in the service of [this] new downtown development strategy, 250 convention centers, sports arenas, community centers, and performing arts facilities were constructed or started, at a cost of more than \$10 billion, and over the next decade, the competition continued unabated."⁷ Costas Spirou, too, observes that "waterfront districts, museum campuses, sport complexes, large outdoor festival venues and elaborate entertainment locales have come to be significant forms of urban development," because they can draw large numbers of visitors and generate considerable profits.⁸ Spirou calls these trends the "disneyfication" of urban space.

One of the keys to this urban agenda was tax increment financing. This is ironic, considering TIF's original purpose. Nevertheless, it is a fact that as the 1990s progressed, mayors all over the country—none more so than Daley—began to use TIF in a decidedly “neoliberal” way, i.e., as a means of raising property values around the central business district and transferring wealth from the lower and middle classes to the upper.¹ It took some time, however, for Daley to enthusiastically embrace this new agenda for TIF. From 1987 to 1997, there was an average of about four new TIF districts created each year in Chicago. In 1997 the city had a total of 41 TIFs. From 1998 to 2002, it created 86 new TIFs, more than twice as many as during the previous fourteen years and more than all of suburban Cook County during the same five-year period.² The number has continued to climb, so that in 2012 Chicago has 163 TIF districts, covering more than 30 percent of the city's land area.³ As we'll see below, the majority of all this TIF money has gone to the wealthiest areas, in and around the central business district.

Since 1998, the city's total revenue from TIF has increased dramatically, as is clear from the following numbers:⁴

1987	\$5.1 million
1990	\$20.1 million
1996	\$50.1 million
1998	\$77.2 million
2000	\$129.3 million
2002	\$216.6 million
2005	\$386.5 million
2007	\$555.3 million
2010	\$509.9 million
2011	\$453.7 million

TIF revenue declined after the economic collapse of 2008, but this trend may be reversed as property values rise again.

To understand how tax increment financing has evolved over the last twenty years, it will be useful to consider some examples of TIF districts (commonly called “TIFs” for brevity). Many of them have been quite small, designed purely for the benefit of one or two businesses. In 1993, for instance, a district was created for Tru-Vue, an 80-employee company that had to expand its location on Goose Island in order to relocate its New York operations to Chicago. Similarly, Culinary Foods moved from West George Street to a TIF district in the Stockyards industrial park, thus providing this neighborhood with a few more jobs. Nabisco benefited from a 105-acre district, more than half of which included the company's enormous bakery employing 2400 people. Nabisco had suggested it might leave Chicago unless the city provided some funding for the facility's \$500-million expansion and modernization, which Daley obligingly did.⁵

On the other hand, some TIFs created in the 1990s were very large—and very controversial. In 1997 the city council, which rubber-stamped virtually every Daley proposal, approved a major expansion of Harold Washington's original North Loop TIF, so that it now covered about a quarter of all buildings downtown and became known as the Central Loop TIF.⁶ Community groups, such as the Chicago Coalition for the Homeless, organized to prevent the expansion from taking place, but to no avail. Speaking for them, the president of ACORN declared at a rally in front of City Hall that “a [Central Loop] TIF is nothing more

⁶ David Roeder, “Taxes to rebuild loop,” *Chicago Sun-Times*, October 4, 1996

than another corporate welfare business raising its ugly head again. We would much rather see the money spent in the neighborhood than being spent with big corporations.”¹ Even the *Chicago Tribune* criticized Daley’s plans for the Central Loop TIF, saying that the mayor had been “maddeningly vague” about how the projected \$300 million would be spent.² The *Tribune* also noted that nearly half of this future “tax increment” consisted of money that, in the absence of the TIF, would have gone to the Board of Education. “Now that the mayor is running the schools via appointees,” the *Tribune*’s editors observed, “who’s going to howl if and when the expanded TIF district starts squandering badly needed educational funds?”³ This criticism of TIF—that it diverts taxes from schools (and the county, parks, libraries, etc.) to the real estate industry—was to become more and more common in the next fifteen years.

Another controversial TIF district was the one in the South Loop, in the neighborhood called Central Station (where Mayor Daley lived). The Chicago Coalition for the Homeless protested the TIF’s passage in 1994, arguing that unless certain provisions were added to the proposal, the result of development would be to displace low-income and minority residents from the area. For instance, the coalition demanded that 20 percent of all new housing in the area be set aside for low-income families, and that 50 percent of the jobs created by development be filled by women, minorities, and the homeless.⁴ These and other demands were not met, but aldermen did tack on an amendment stipulating that at least 300 units of housing be provided for low- and moderate-income residents.⁵ This, unfortunately, was not enough to save the neighborhood from gentrification, as the fears of advocates for the homeless have largely come to pass.⁶

Neighborhood advocates had less cause to complain, however, with regard to the mayor’s support for the city’s industrial corridors. We have already seen that Daley prevailed on the city council to establish two planned manufacturing districts in 1990; since then, he had continued to juggle support for industry with his deeper commitment to commercial and residential development downtown and elsewhere. Among the TIFs he proposed in 1997, therefore, were six that were designed to preserve historic industrial areas by either encouraging revitalization or—in the districts that were close to the Loop, such as the Pilsen one—protecting them from an invasion of commercial and residential property, which would drive up land values to the point that manufacturers would be forced out. To this end, the Daley administration backed a zoning change, for example, in the Kinzie industrial corridor, which would keep residential development to a minimum. In addition, the administration promised to use the future TIF money for such industry-friendly purposes as constructing new sewers, improving viaducts, funding job-training programs for local employees, and modernizing buildings that were obsolete for modern manufacturing needs.⁷ In subsequent years, most of these industrial TIFs proved to be fairly successful.⁸

Nevertheless, despite such moves to accommodate the interests of industry, workers, and even a few neighborhoods on the West and South sides of the city, it is undeniable that Daley’s chief passion was to beautify, develop, and market Chicago for global business. The TIFs he was establishing downtown were facilitating the construction of new office buildings, the recycling of older buildings into condominiums, the creation of affluent new communities near the Loop, and a glittering array of initiatives to beautify the gentrifying portions of the city. Daley seemed particularly fond of wrought iron—“wrought-iron fencing erected by the mile,” as one newspaper reported, “new bridges sporting wrought-iron trim and obelisks and

sculptures, wrought-iron lampposts with fanciful curlicues”¹—but he also put up flowers all around the business district (hanging from lampposts and such), invested in rooftop gardens, planted hundreds of thousands of trees, and encouraged “nightly illumination of as many downtown facades as possible, to create a Midwestern ‘City of Light.’” Many millions of dollars in TIF funds were spent on this sort of landscaping, for which Chicago was famous already by the late 1990s. The old gritty image of the industrial, and then the deindustrializing, city was making way for the new image of a sparkling, cosmopolitan, desirable place to live. The landscaping and beautifying rarely extended to lower-income neighborhoods on the West and South sides of the city, but around the business district Chicagoans could readily see their TIF money at work.

At the same time, such organizations as the Commercial Club, the Chamber of Commerce, and the World Trade Center Chicago were doing their part to improve the city’s image in the eyes of global businesses. Specifically, in 1998 they founded World Business Chicago, a group that, according to its original managing partners, would be devoted to “telling Chicago’s story” to international businesses in order to attract them to the area. In 2000 it merged with the Chicago Partnership for Economic Development, created by Daley in 1999, which enlarged the organization and gave it a more clearly defined corporate structure. The mayor was, and remains, the chairman; the board of directors consists of some of Chicagoland’s leading corporate executives.² Major initiatives of the last twelve years, including the colossal “Millennium Park” project, have borne this organization’s imprimatur.

The outlook and goals of World Business Chicago are those of the Commercial Club and the Civic Committee. They have not changed much since the 1980s, although the business elite has grown more savvy regarding public relations, so that, for example, none of the reports now published by these commercial organizations explicitly states that workers’ compensation and unemployment insurance should be reduced (as *Make No Little Plans* stated in 1984). The public would probably not approve of such a frank admission. One can get a sense of the downtown business elite’s current views by reading the Commercial Club’s publication *Chicago Metropolis 2020: The Chicago Plan for the Twenty-First Century* (2001). Modeled on Daniel Burnham’s 1909 *Plan of Chicago*, it lays out a comprehensive and ambitious vision for the region’s social and economic future. The framework is what the author calls “regionalism,” an insistence on the necessity of coordinating political and economic initiatives in the Chicagoland region, including the Cook, DuPage, Lake, McHenry, Kane, and Will counties. More pertinent to this paper, however, is the plan’s casual dismissing of manufacturing in favor of services, such as entertainment, tourism, education, health services, financial services, and publishing. Tax increment financing is declared “indispensable,” and the entire region is urged to make use of it.³

Not coincidentally, it was around the time of this report’s publication that the Daley administration’s use of TIF really started to become obsessive. It is true that some of the new TIF districts and programs faced little opposition from neighborhood groups. For example, to help small businesses, the city initiated a program called the Small Business Investment Fund, whereby businesses in a TIF district could apply for up to \$50,000 of funding for capital improvements.⁴ This program still exists and is very popular. In addition, a number of TIF districts continued to be created in underprivileged communities on the South and West Sides. To mention one or two at random: nearly 400 jobs were expected to be created and retained by means of the city’s assistance with building a high-quality daycare center on the West Side,

expanding a barrel recycling business, and expanding a North Side computer software development firm.¹ One could argue that these are exactly the kinds of projects for which TIF was originally intended.

However, as one peruses newspaper articles and editorials and critical studies of TIF, one realizes that the majority of TIF funding has, apparently, gone to politically connected businesses that are *not* located in the most “blighted” parts of the city. Jacqueline Leavy, executive director of the Neighborhood Capital Budget Group, said it well in 2000: she remarked that “the city has negotiated too many subsidies to private developers without adequate public oversight or a reliable accounting of the jobs supposedly created.”² The *Chicago Tribune*, *Chicago Sun-Times*, and other newspapers have scores of articles describing deals made with particular companies, subsidies given to them ostensibly for the purpose of convincing them to stay in Chicago. But there is little transparency or accountability with respect to TIF, so who is to say what really happened? When Quaker Oats Co. got \$9.75 million in TIF funding to convince it to keep its headquarters in the city, who is to say what sort of negotiations went on between the company and the Daley administration?³ Maybe Quaker would have stayed in the city anyway, and that \$9.75 million could have gone to such taxing bodies as schools and parks instead of to the company.

In the early 2000s, political observers were growing more concerned not only over the lack of transparency or fairness of tax increment financing but also its fiscal costs. The nonprofit Neighborhood Capital Budget Group published a report in which it studied 36 TIF districts and found that in all of them, property values had already been growing prior to TIF designation. In other words, subsequent development was not solely or even primarily a result of the TIF, which meant that government bodies were being unfairly deprived of tax revenue from growth in property values. In fact, the NCBG calculated that over the lifetime of these 36 districts, the taxing bodies would lose \$1.3 billion in revenues they would have collected had the areas not been designated as TIFs. The Chicago Public Schools, for example, was losing a total of \$631.7 million from these 36 districts, and the City of Chicago \$254.8 million. These numbers alone go a long way towards explaining the dire fiscal straits in which Chicago finds itself in 2012.⁴

It is not hard to find examples of the profligacy of the Daley administration. Millennium Park ended up costing about \$500 million, \$280 million of which were provided by the Central Loop TIF.⁵ (Would any sane person argue that Millennium Park was built in order to counteract downtown blight?) In 2008, the city committed \$75 million to Rush University Medical Center—a private hospital—an allocation that Cook County Commissioner Mike Quigley criticized as not “the proper use of TIF money.”⁶ On a smaller scale, the Chicago Symphony Orchestra has received \$2.5 million.⁷ The privately owned Willis Tower downtown was awarded at least \$28 million for remodeling.⁸ In 2005, \$4 million went to Jewel Food Stores Inc. to build a store on the Near West Side, not a low-income area.⁹ In fact, between 2000 and 2011, nearly half of TIF money designated for private sector projects went to some of the area’s most profitable corporations, including CareerBuilder, UPS, Target, and Quaker Oats.¹⁰ Amisha Patel, executive director of the Chicago-based Grassroots Collaborative, aptly summarized the inequitable history of TIF in the 2000s: “Of the \$2.45 billion in TIF dollars spent from 2004 through 2008,” she said, “the Loop, Near North, Near South, and Near West communities received \$1.56 billion, or 63%.”¹¹

The incredibly lucrative Central Loop TIF expired in 2008, but in 2006 the city had designated another TIF downtown that would prove to be almost as lucrative: the controversial LaSalle TIF around Chicago's financial district. As usual, the legal restriction of TIF to blighted neighborhoods did not pose a problem: city officials simply argued that some of the buildings in the area were "old" and "deteriorating," and that new infrastructure was needed.¹ This was apparently sufficient to cover the legal requirements for TIF designation. The Daley administration estimated that over its lifetime the TIF would capture at least \$550 million in tax revenue, to be used for "high-quality retail development, improvements to the Chicago River seawall, new and improved open spaces, enhanced transit stations and public right-of-ways, and improvements to streets and alleys. Funds are also targeted for land assembly projects, public works improvements, job training, day care, and efforts that improve traffic and pedestrian circulation throughout the 49-block district and its environs."² These sound like worthy projects, but the fact is that in 2006 property values were already growing—tremendously—in the Loop, and TIF designation entailed that taxing bodies would collect less revenue from this property growth. Fed up with the city's shenanigans, Mike Quigley proposed in 2006 that the state study how TIFs were applied and whether the law was working as intended. His proposal, however, was rejected by the Cook County Finance Committee—which was chaired by John Daley, Richard Daley's brother.³

Even *Crain's Chicago Business*, no opponent of financial help to the business district, criticized the LaSalle TIF. Among other things, its editors observed that "roping off downtown tax revenues for 23 years would put hundreds of millions of dollars off-limits to county government for most purposes," at a time when the county was already experiencing a fiscal crisis. They were also concerned that Daley would have no accountability on how he spent the money.⁴

In part because of the LaSalle TIF, calls for TIF reform grew more frequent after 2006. Liberal journalists such as the *Reader's* Ben Joravsky started popularizing the idea that tax increment financing was just a "slush fund" for the mayor; Cook County Commissioner Mike Quigley published a long primer on how TIF was being abused by the mayor and how it could be reformed; even aldermen, who hitherto had rubber-stamped every Daley TIF proposal, began to have second thoughts because the administration was routinely moving funds from ward to ward.⁵ Some aldermen made proposals for reform, which went nowhere.⁶ In 2006 the Cook County Clerk, David Orr, started publishing a four-part annual report on TIF, an online TIF primer to help the public understand what was at stake, and online TIF district maps. In 2007, for example, he observed that since 1986 Chicago's taxpayers had paid more than \$3 billion in TIF money.⁷ (Four years later, that number had risen to \$4.6 billion.)⁸ In 2009 he called for a "moratorium of new Chicago tax increment financing districts until new leadership is installed and a thorough review of existing TIFs can be conducted."⁹ Needless to say, a moratorium did not happen.

Meanwhile, as taxpayers and the city were paying hundreds of millions of dollars to beautify the downtown area and its environs, hundreds of thousands of African-Americans were languishing on the city's South and West sides. The historian Paul Street observes that, as of 2005, a fourth of the Chicago metropolitan area's black households were officially poor, compared to 5.6 percent for white and 16 percent for Latin households. More than a third of black children lived in poverty. (Lately that has increased to

more than a half.)¹ According to the 2000 census, black median household income was 58 percent of white median income. Economic development was so lacking in some neighborhoods that one of them, Auburn Gresham on the South Side (a neighborhood that is 98 percent black), celebrated the opening of its *first sit-down restaurant* in 2004. It took “seven years, some arm-twisting, and a complex financial arrangement that included \$55,000 in contributions from parishioners” for this restaurant to be built.² When one recalls that tax increment financing was intended precisely to remedy economic decay in neighborhoods like those on the South Side, facts like these are a terrible indictment of Chicago politics, indeed of contemporary American politics in general.

In fact, not only did the poorest neighborhoods in Chicago fail to develop under Daley; some of them actually de-developed. A 2006 study found that the poorest sections of the city lost nearly 600 businesses and more than 14,000 jobs between 1995 and 2004.³ As Jesse Jackson said, “Right now, you go northwest, there’s, like, three jobs for every one person. If you go south, there’re six people for every one job. Here, taxes are up. Services are down. He [Daley] has not addressed structural inequalities.”⁴ More accurately, he has addressed them—by aggravating them. With the help of tax increment financing, Daley has presided over an era of unprecedented gentrification.⁵

Mindful of this, politicians, journalists, and academics continued to make proposals for TIF reform in the last few years of Daley’s mayoralty; it wasn’t until Rahm Emanuel was elected mayor in 2011, though, that something was done about them. Several months after his election he announced the creation of a task force to review the TIF system and recommend changes. In August, 2011 it published its report, which essentially confirmed the claims of long-time critics: the task force proposed ways for the city to increase its accountability, monitor its performance with regard to TIF goals, and increase transparency. For example, it recommended that “every five years TIF districts should be subject to strategic reviews which lead to continuation of the district, revision of the district strategy or more significant change.”⁶ Mike Quigley, David Orr, and other critics of Chicago’s TIF program praised Emanuel’s moves toward reform; on the other hand, Quigley noted that “nothing in the Emanuel report would change the way TIF districts operate.”⁷ The tax increment financing program would continue to be basically a slush fund at the mayor’s disposal; the main difference is that, if the task force’s recommendations were implemented, the mayor would be a little more accountable than before.

In fact, after Emanuel announced the implementation of some of the proposed reforms in January, 2012, it appeared that not much of real substance had changed. It’s true that a comprehensive online TIF database would become available to the public and that monitoring of TIF performance would be moved to the Department of Revenue, which would hire independent auditors to perform random audits. None of this, however, has prevented taxpayers’ money from continuing to go to some of the wealthiest people and corporations in the world, when Chicago Public Schools is facing a deficit of at least \$700 million in 2013 and the city will have a deficit of \$300 million.⁸ For instance, \$5.2 million are being diverted to the redevelopment of Harper Court in Hyde Park, whose main beneficiaries are the University of Chicago and Hyatt Hotels. That money could have gone instead to neighborhood schools and other public services. This is a particularly egregious case because Chicago’s Pritzker family owns and controls Hyatt Corporation, and Penny Pritzker serves on the boards of both Hyatt and CPS. So, as she proposes a CPS budget that slashes \$3.4 million from schools in the same TIF district that Harper Court is in, she personally benefits

from a TIF grant of \$5.2 million.¹ This is surely a conflict of interest, of the sort that TIF reform has evidently done nothing to prevent. The Chicago Teachers Union publicized this conflict of interest and abuse of TIF during its strike in September, 2012—marching teachers held up signs with messages such as, “Silly Rich Guy, TIFs Are for Kids”—but to little avail, as the Hyatt TIF has not been canceled.²

It is a serious question, however, whether things can continue as they are for much longer. As we have seen, the momentum behind TIF reform finally succeeded in accomplishing some of its goals in 2011 and 2012; it is unlikely that the movement for greater equity and democracy in tax increment financing will simply dissolve away, so soon after it has tasted partial success. California abolished TIF in February, 2012, thus giving the \$6 billion a year that TIF was consuming back to the state, to be spent on schools, roads, public transit, debt-servicing, and other vital needs.³ Colorado might soon follow California’s example.⁴ The Iowa legislature is considering changes to the state’s TIF laws.⁵ A nation-wide movement seems to be slowly developing for TIF reform, as states, counties, municipalities, and school districts sink under the burden of intolerable debt. More and more people are coming to realize that money locked away in “redevelopment” programs would be better spent on necessities such as education. One can only hope that these people will be able to convince the public of the wisdom of reform.

*

Reading Greta Krippner’s *Capitalizing on Crisis: The Political Origins of the Rise of Finance* (2011). One of her arguments is that the deregulation of finance—and the U.S. government’s access to global capital markets from the late 1970s on—led to an explosion of credit in the U.S. economy, which alleviated the social tensions (over distribution of wealth) of the 1960s and 1970s. But credit can’t keep expanding forever. As it contracts and becomes more expensive in the coming years, explosive conflicts will return. —More generally, her argument is that the turn to finance wasn’t really planned by policymakers but emerged accidentally as they tried to solve the problems of inflation and social conflict. The financialization of the economy ended up being a way for policymakers to postpone the inevitable conflicts over “distributional” priorities.

January, 2013

My New Year’s resolution is to lose my small beer belly. I might start working out again too.

I don’t anticipate writing in my journal as much as I used to. I want to focus on publishing from now on, not taking notes.

Reading Jacob Bronowski’s *The Ascent of Man*.

Over the next ten weeks I’ll be reading or skimming many dozens of books for three exams I have to take in March (in Latin American history, U.S. labor history, and general U.S. history after 1763). Good times. In a lot of cases I’ll just have to read book reviews, since I’m not a speed-reading machine. One particularly thorough overview of historiography, which I plan to make good use of, is *American History Now* (2011).

*

Here's a paradox about the self.— The self needs otherness, an other, in order to exist and to define itself. Its reflection in an other is necessary to its existence and self-affirmation. But at the same time, the whole point of this reflection and self-affirmation is really to reduce or in some sense eliminate the otherness of the other! So the self needs the other and even posits it, but only so that it can affirm itself and thus transcend, so to speak, the other's otherness! It "posits" the other in order to (in some sense) transcend the other. That is, it posits the other in order to get recognition from the other in order to reduce the otherness of the other and so see itself confirmed (by the other).

The paradox, in other words, is that the self needs the other but wants to overcome its otherness. (In fact, it needs the other *in order to* overcome its otherness, i.e., to confirm and "define" itself). And the way to do that is premised precisely on the existence of otherness, for it is by having its self-love recognized and reflected by an other that the self to some extent overcomes the other's otherness.

Headache.

April - August

Finally done with exams.¹ Thank God. Now I can return to reading what I want to read. Starting with Thomas Ferguson and Joel Rogers' *Right Turn: The Decline of the Democrats and the Future of American Politics* (1986). An exceptional book.

By the way, I'm still involved with the ISO—though I'm not really sure why. I don't like most of the people very much. They're not obnoxious, by and large; they're just typical group-thinking doctrinaire leftists, confused in a lot of ways, naive about the potential for "revolution," and intolerant of dissent. Also, annoying reflexive feminists. Obsessive, naive feminists. In fact, I've never liked most leftists very much. They tend to be almost as stupid and flaky as everyone else, only (sometimes) in different ways. Their smug, cliquey, postmodern, hipster vibe is the opposite of me.

I honestly find it baffling that I published the first version of *Notes of an Underground Humanist*. It's crap. How could I have done that? It really shames me, because some of the book is simply *frivolous*. The second edition is incomparably better and more serious. In the coming months I plan to buy all the copies of the first edition that are still out there and destroy them.

Ironically, despite my talents, it's taken me quite a long time to mature as a writer and thinker. That's probably in part a result of my having lived in a social vacuum much of my life—my having received very little feedback from anyone. But it's also just the fact that "deep down" I'm a child, a naïve and self-centered child who likes to be mischievous and so on. For some reason, this trait, this immaturity, seems to characterize a lot of artists and creative thinkers.

Dated a 28-year-old named Ellen for a few weeks, a rather abrasive person but cute, [...] but we ended it because we're definitely not right for each other. Now dating a professional photographer named Lizz, 31.

Losing weight with my kale shake diet and going to the gym periodically, weightlifting and taking spin classes (once in a while).

One of the reasons I respect Chomsky is that I suspect he's one of the few intellectuals who would acknowledge the importance of my revisions to Marxism if I showed them to him. He wouldn't care much, since he isn't very interested in Marxism, but he would recognize the force of the logic. He might actually be intrigued by the possibilities my revisions present for reconciling Marxism and anarchism, in that I show extreme statism to be contradictory with the fundamentals of Marxism. "Thinkers" have been trying for over a hundred years to "reconcile" Marxism and anarchism—which in some respects isn't hard to do—but only with my revision to the theory of revolution has the reconciliation taken place. And yet if/when

¹ [Except that the profs who read my Latin American exam failed me because of a couple inadequacies in my answer to one question. So I have to redo it in the fall (with different questions).]

my book is published, no one will notice it or give a damn. Originality is shunned or not noticed, except by Chomsky. (Or, rather, all that matters in the world is connections, not ideas.)

But Chomsky is right that all these abstruse debates about Marxist theory and anarchism and Leninism and so on are basically pointless. Ultimately, who cares? We know what's necessary: organization. That and education about how the world works. That's all. I love Chomsky's "anti-intellectualism": he brushes off centuries of debate with a shrug, a mild gesture that in his case is wonderfully pithy.

In short, Chomsky "keeps it real." Try finding *that* quality among intellectuals! He's practically the only one.

I'm going to try to stop wasting my time on the internet. I write that here because it means I have to follow through. So many hours wasted! I'm done with that. From now on, work.

I sort of enjoy my role as the gadfly, the non-conformist, of any given group. For instance, the totalitarian political correctness of leftists irritates me so much that finally, after a year of tolerating it, I gave into my mischievous side. Wrote this in response to a comment thread on Facebook:

Steven Pinker's defense of Colin McGinn [who sent sexually suggestive emails to a graduate student and was accused of harassment] is obviously wrong. Putting that aside, though, his attachment to the idea that "human nature" exists is right. In fact, it's just common sense. As Chomsky says, "human nature" is simply whatever it is that distinguishes humans from, say, pigeons. One aspect of human nature is that we have the capacity to form languages of a massively more complex character than those of other great apes. Another is that we have self-consciousness, unlike pigeons. Etc. So, human nature exists, and the mind is not a tabula rasa. (Philosophical empiricism, along the lines of Locke and Hume, is wrong; "rationalism" is right.) It's also an obvious fact - though a lot of postmodernists might disagree - that one's genetic endowment plays an enormous role in the development of one's character, one's "intelligence," etc. And it should surprise no one that hormones, sex steroids, adrenal glands, and so forth are in part determinative of behavior and mentality (although "social construction" plays a role too). For instance, according to a study by Heino Meyer-Bahlburg, women with congenital adrenal hyperplasia "as a group have a lower interest than controls in getting married and performing the traditional child-care/housewife role. As children, they show an unusually low interest in engaging in maternal play with baby dolls, and their interest in caring for infants, the frequency of daydreams or fantasies of pregnancy and motherhood, or the expressed wish of experiencing pregnancy and having children of their own appear to be relatively low in all age groups." The study may have drawn incorrect conclusions, but prima facie they aren't absurd, notwithstanding the dogmas of what Pinker calls "gender feminism." It's true that political conservatives may seize on such scientific conclusions as justifications or "naturalizations" of reactionary values (about "women's proper sphere"), but of course that's a logical leap. "Is" doesn't imply "ought." And yes, it's legitimate to argue that certain kinds of scientific research shouldn't even be conducted because it's possible that they would be used to justify reactionary politics. But the mode of argument that leftists often display when criticizing politically incorrect ideas about sex and gender is less legitimate: for instance, Owen Lloyd's piece (linked above) is full of logical fallacies, oversimplifications, an incredible and superfluous personal animus against Pinker, the attribution to him of horrible motives (which he may have, but it's irresponsible to say so given the lack of evidence), etc. There's a totalitarianism of the left, a hypersensitivity, a paranoia about the motives of anyone who disagrees with you, which is manifested in the reflex to instantly condemn and ridicule even those opponents who are (or seem to be) a cut above the crude racists, political hacks, and corporate lackeys. The political right

certainly doesn't have a monopoly on dogmatism and narrow-mindedness; in fact, many "politically correct" ideas/attitudes are pure dogmatisms, usually revolving around the "socialization is (almost) everything" dogma (which, incidentally, Marx disagreed with). Maybe Pinker is a bad person, but in general - with some exceptions - I think it's good to evaluate ideas on their merits rather than on the basis of what it's conceivable some reactionary might use them to justify. (Again, I'm not referring to Pinker's defense of McGinn, which is absurd.)

Strangely, that didn't get much of a debate started.

I miss reading books that interest me. So, screw it. I'm reading Daniel Guerin's *Anarchism: From Theory to Practice* (1970).

—I truly am an anarchist in the root of my being. Viscerally. A radical democrat. It's the primordial structure of my character. The thing I dislike most in the world is power/authority, and I most love people with open minds, free and accepting personalities, easygoing and curious minds. I love spontaneity (freedom), which is the antithesis of authority.

(I should say, though, that in the context of political action I appreciate the need for structures of authority. Anarchy is the ideal we should always be trying to approximate, but only to an extent that is feasible, sane, and not counterproductive to our specific political goals.)

Reading Frances Fox Piven and Richard Cloward's *Regulating the Poor: The Functions of Public Welfare* (1971/1993)—in depth, unlike most of the other stuff I'm reading on unemployment. It's a brilliant and eye-opening book.

Also reading David Graeber's little book *Fragments of an Anarchist Anthropology* (2004).

In dark moments I'm still tormented by this thought: *If you can't be everything, why be anything?*

[...]

Hermann Hesse: "Whoever wants music instead of noise, joy instead of pleasure, soul instead of gold, creative work instead of business, passion instead of foolery, finds no home in this trivial world of ours."

Reading *The Dominant Ideology Thesis* (1980), by Abercrombie, Hill, and Turner. It'll be relevant for my dissertation, especially the chapter on theory (where I'll criticize Gramscianism and so forth).

Just for the hell of it, here's a Facebook post of mine on some new bestselling book by Christopher Hayes called *Twilight of the Elites: America after Meritocracy*:

....Regarding Hayes's ideas, I'd say that in some sense they're just truistic, while in another sense they're simplistic. Social criticism isn't difficult, and at this late stage of history it's almost impossible to say anything theoretical that's both new and profound. Even C. Wright Mills's book, from what I read of it, didn't strike me as profound: the whole analysis is pretty obvious and has been more or less understood for centuries, though the nomenclature changes (power elites, power structures, dominant classes, the rich, elites, etc.). As Chomsky says, the "theories" we use to understand society are fairly trivial and, when shorn of needless jargon, can be understood by a twelve-year-old. Hayes's formulations, though, are objectionable. He's kind of like Robert Michels in separating his critique of institutions from a critique of capitalism, in fact in largely ignoring the latter as such (or so it seems). It isn't "meritocracy" that produces all these social ills; it's meritocracy, or rather bureaucracy, in the context of corporate capitalism. It's the latter that's the main problem, indeed the determinant of the forms that contemporary meritocracy takes. (But Hayes is mainstream and doesn't want to be politically

marginalized, so he couches his "analysis" in terms of the less challenging notion of meritocracy. Also, he probably thinks that invoking that term, a less common one than capitalism, will give his book the appearance of originality.) As for the lack of empathy that meritocracy supposedly produces, that is in fact a function of bureaucracy itself—and, in slightly different ways, our competitive, atomistic, acquisitive economic system—and has been so for many centuries. It's not a new thing that bureaucrats and those in the elite lack empathy and knowledge. That's not some profound discovery of Hayes's. Nor are his solutions particularly interesting. "Reduce inequality." Okay, great. Wish I'd thought of that. But how is it going to be done? It can't happen anymore in the context of capitalism. So what we need are global social movements aimed at the very heart of our economic order (rather than at "meritocracy," whatever that means). We need an alternative political economy, one structured around cooperatives, municipal socialism, public banking, the "solidarity economy," regional (as opposed to national) governance, and so on. (See Gar Alperovitz's *What Then Must We Do?*) "Higher and redistributive taxes" [as a solution] are hopelessly inadequate—and, moreover, hopeless to achieve, at least in the absence of global upsurges of the working class. But, to have any success, such upsurges will have to radically change the existing configuration of power and capitalism itself—which gets us back to the need for a prolonged social revolution, not some technocratic tinkering with tax rates.

September - December

Mauritz Hallgren's *Seeds of Revolt: A Study of American Life and the Temper of the American People during the Great Depression* (1933) is quite good, a very thoughtful analysis.

Um, where did I come from? A person born in the 1980s in the U.S. and formed in the 1990s and 2000s....turned out *this* way. How did I acquire my values, my interests, my nineteenth-century humanism? How is such originality possible? Rejection of everything I was born into, every cultural, intellectual, technological thing of my time, my whole environment.... I just *instinctively* rejected it. Understood its decadence and mediocrity, and instinctively identified with the past. Old traditions, old humanism. Somehow, with no mentors or teachers, I more or less knew what was good in the world and what was ugly, and I resisted constant pressures to follow the ugly.

I'm something like an *egotistic universalism*. Most things "particular" or time-bound bore me—except insofar as they express the general—but the timeless fascinates me. It's my misfortune that I live in a time-bound world.

(—Drunk on Beethoven's *Fidelio* and *Egmont* overtures and *Leonore 2*.)

"In an amoral world, the amoral man is best qualified to succeed."

In a not very upbeat mood.— I have to admit that the United States isn't *all* bad. While it does tend to make you misanthropic, cynical, selfish, callous, apathetic, lonely, mean-spirited, and unhappy, it also tends to give you a kind of grit, strength (the strength born of war), imperviousness, self-reliance, and grim awareness of profound truths about life in our universe. The United States is the *reductio ad absurdum* of existential absurdity—the pure essence of the human condition according to existentialism, nihilism as the sole principle of life. The United States, while representing all that is horrible in the world, also represents all that is deeply true—because deep truth and horror are one and the same.

A part of the prospectus that I decided to get rid of:

....I intend the whole essay to be a kind of polemic against “Gramscianism,” viz., an emphasis on the supposed cultural and ideological integration of the masses into the dominant order. Intellectuals and “ordinary people” alike commonly assume that such integration, involving “shared values,” ideas, and identities, is an important precondition for the stability and coherence of a given society.¹ For instance, among the public there is widespread acceptance of the idea that particular countries have particular cultures, and that such cultures and value-systems are what partially “unify” the country and distinguish it from others. Among academics, on the other hand, the contemporary fixation on discourses, social constructions, subjective identities, and cultural phenomena of all sorts naturally implies that insofar as societies are relatively stable, it is because mainstream culture serves as a powerful glue. For the postmodernist, after all, social life is reducible to language, discourse, images, etc.; thus, if a society does not disintegrate, it must be because its denizens accept the predominant discourses. This conclusion is rarely articulated, since it entails the politically incorrect idea that ordinary people do not have much agency, but one is committed to it inasmuch as one accepts the idealistic postmodernist framework.

I reject all this Gramscian and postmodernist idealism (or semi-idealism, in Gramsci’s case). I think “culture” is not of primary importance in explaining social dynamics, nor is mass “consent”—cultural, ideological, political—a very useful concept in explaining how a ruling class can maintain social control.² There are many ways of maintaining control, chief among them the use of force and, secondly, myriad political and economic—as opposed to cultural—strategies of combating workers’ (or slaves’, or peasants’) power.³ That culture follows economics and politics should in fact be axiomatic, an *a priori* principle, simply because it requires *resources* to propagate discourses and cultural values, and resource allocation is determined by economic dynamics, class relations, conflicts between groups of people with different economic interests by virtue of their occupying different locations in social structures.⁴ Capitalists propagate ideas compatible with their interests while working-class organizations do the same as regards their own interests—but the latter are typically less successful, since they have fewer resources. Mainstream society therefore tends to reflect capitalist values; but whether and to what extent ordinary people accept such values, and whether such (partial) acceptance does much to ensure social stability, are at best open questions.

One of the premises of my dissertation will be that “the dull compulsion of economic relations” (to quote Marx) is, in addition to the ruling class’s aforementioned use of force and political maneuvering, largely responsible for people’s continued subordination to the rule of an elite. People simply have to conform to institutional structures and accept “the rules of the game” in order to survive; otherwise they’ll be kicked out, killed, sent to prison, beaten by police, made homeless, institutionalized in some way or other, or shunned. This is how society should be conceptualized—not as a set of nebulous discourses or values but as an incredibly complicated set of interlocking and often conflicting institutional roles that have more or less severe sanctions attached to their violation, depending on how “dominant” and powerful the institution in question is. Whether someone actually believes in the ideologies and values propagated by dominant institutions is less important than the fact that ordinarily he has to act as if he does—he has

¹ See Nicholas Abercrombie, Stephen Hill, and Bryan Turner, *The Dominant Ideology Thesis* (London: George Allen & Unwin, 1980).

² If the Marxian term “ruling class” is objectionable, one can substitute for it C. Wright Mills’s “power elite,” or simply “the rich,” or “the powerful,” or whatever.

³ See Patricia Cayo Sexton, *The War on Labor and the Left: Understanding America’s Unique Conservatism* (Boulder, CO: Westview Press, Inc., 1991).

⁴ Erik Olin Wright, *Classes* (London: Verso, 1985).

to broadly conform to social expectations—because otherwise he'll risk shelter, sustenance, security, and self-esteem (given the psychological burden of social rejection).

In light of the punishments attached to nonconformism, what is striking is not how stable and coherent society is but how *unstable* and *incoherent* it is. People are constantly rebelling in both small and significant ways, constantly defying authority and its supposed “hegemony,” constantly withholding their consent from their “superiors.” I don't think these facts are emphasized enough in most historiography. We should think of the world more in terms of conflict—usually at least implicit and muted, often explicit and riotous—than consent or consensus. Or, more accurately, whatever “consent” people give to existing societal arrangements is, first and foremost, provisional and self-interested, grounded in the perception that they have to play by the rules of the game in order to survive and prosper. The antagonism of interests between classes and other groups of people (authorities vs. subordinates, rich whites vs. poor blacks, financiers vs. industrialists, and so forth) always has the potential to become explicit and disruptive, namely if people conclude that making it so will benefit them—or, alternatively, if they're just desperate and fed up with injustice. Economic depressions and other such moments of crisis are interesting to study because they reveal so starkly the conflictual essence of society. Masses of people conclude that they have little to lose, and the veneer of consent is stripped away.

I'll have an in-depth discussion of these theoretical points in chapter three, where, among other things, I'll argue against Melvyn Dubofsky's perspective in an essay published in 1986, the content of which is summed up by its title: “Not So ‘Turbulent Years’: A New Look at the 1930s.”¹ The sections below on historiography and on the third chapter return to these matters in some detail.

I've had second thoughts about all that.

Chomsky and Zinn had the good fortune to meet a good female early on; I wonder whether they would have been so idealistic about the species if they'd had to date two hundred, three hundred people, and just keep trying, trying, searching everywhere for *someone*....

Sure, I can have a good time and go on dates and be playful and laugh and flirt with these girls, but....it almost never amounts to anything, because neither of us is particularly enamored of the other. The aggregate of all these disappointments—countless—would deflate the optimism of a fucking Dalai Lama.

The human spirit, or at least *my* spirit, is astonishing. How am I able to be so positive and happy most of the time?? It defies physics, the laws of nature. I'm a rupture in spacetime.

Life has gotten rather monotonous lately, so, fuck it: I'm changing things a bit. Gonna hire a personal trainer at the university gym; gonna start getting up earlier than 10:30; gonna be more productive in general; gonna keep trying harder than ever to find a good, interesting, attractive woman. (Yeah, good luck with that, Chris.)

....I also noticed today that drinking coffee has a quite noticeable effect on my mental health and energy. Years ago I didn't like it, but I have no idea why. Gonna try to drink it regularly from now on. — The whole rest of the day I was in a great mood! Didn't even nap for two hours in the library! :-)

[...]

Spent the night at Amelia's place (the Pole from a couple years ago) after going on an OkCupid date with an Australian girl. There wasn't much chemistry with the latter—she was intelligent and beautiful but too talkative and not a good listener, and anyway wasn't attracted to me—but sensual Amelia made up for that. (She recently broke up with her boyfriend.)

¹ Published in Charles Stephenson and Robert Asher, eds., *Life and Labor: Dimensions of American Working-Class History* (New York: State University of New York Press, 1986).

....About a dozen more internet dates, none of them amounting to anything. (Except that with one girl, who wanted to be friends, I later went to a great performance of Wagner's *Parsifal*.) What fun the dating world is! Endless joy and an endless string of successes.

Louis CK is right that your body has antibodies against sadness. In one moment you're in despair, full of loneliness and sheer exhaustion from the search for a good woman, crying, while ten minutes later you're happy and rejuvenated. Fascinating!

[...]

....Seriously, this summer, at least, I plan to live in Paris. I have to try it out once to see what it's like, lest I spend the rest of my life regretting that I never lived in Europe (aside from when I was 20) and wondering what might have been. I'm a foreigner in my country, that's clear and not an exaggeration; maybe the converse is true, that I'd be (relatively) at home in a foreign country. It's unfortunate and makes me feel "petty" that at 33 I'm still concerned with personal, subjective issues like my happiness and my desire to settle down with a good woman—it makes me feel behind the times, and behind my age (for I *should* only be concerned with my career and with contributing to collective political struggles)—but I simply *need a woman*, and evidently I'm not going to find a good one in the U.S. Or maybe I will, if I keep trying.... It's possible. But no more internet dating; it doesn't work.

Finished the first draft of the prospectus. That took up most of this semester, although at least half the time I was doing effectively nothing, just worrying or wondering or watching YouTube. It didn't feel right for me to write the AK Press book, so I didn't touch it. But just now I returned to it—and was reminded of what it's like to be inspired. It's going to be a pretty great book. *This* is what I have to do with my life, this anti-institutional creative stuff. Writing academically is anti-creative and depressing, given all its constraints. That's the real reason for my depression this semester, namely that I wasn't letting myself write creatively. So screw it. Next semester I'll try to finish the book, and do the dissertation on the side.

I've wasted enough time in recent months, and years. Getting back to work on the book immediately. Tonight.

My students wrote their TA evaluations today. Once again, almost uniformly positive. "He's a very compassionate person," "He's the coolest teacher I've ever had," "He'll make a great educator or history professor someday," "He's approachable, not intimidating like other TAs" (although it'd be nice to be thought intimidating for once), "Very helpful in clarifying the lectures," etc. One girl apparently wrote the professor an email saying I was "phenomenal": "I have nothing but great things to say about his passion for the field." It doesn't mean much, but it's nice to read comments like that.

Here's the prospectus for my dissertation:

Proposal for a dissertation tentatively titled
 THE UNEMPLOYED IN THE GREAT DEPRESSION:
 A STUDY IN THE RADICALISM OF "ORDINARY PEOPLE"
 By Chris Wright

INTRODUCTION

In a time of widespread unemployment and economic stagnation, it is an odd fact about American intellectual culture that the unemployed are not at the center of scholarly and journalistic study. Innumerable works do exist about subjects that pertain at least indirectly to unemployment, such as urban poverty, deindustrialization, anti-black racism, and the "informal economy," but the unemployed themselves, *as* unemployed, seem to receive comparatively little attention. Especially from a social history point of view, the condition of unemployment—its continuities and discontinuities over time—has been understudied. One searches in vain in contemporary scholarship for thorough studies of how Americans have coped with the loss of jobs, how or if they have organized "self-help" groups in times of economic hardship, what sort

of political consciousness the unemployed have had, whether they have organized political resistance and what forms it has taken. What has unemployment done to the family, the neighborhood, social ties of all kinds? What categories of workers were most likely to be unemployed at particular times? How pronounced were the tendencies toward “apathy” or acquiescence that conventional wisdom assigns to the jobless? These are the kinds of questions that aren’t sufficiently addressed in recent scholarship, and that in my dissertation I’ll try to answer in relation to a specific point in time: the Great Depression.

I’ve chosen the Depression for several reasons. The least interesting one is that an abundance of sources exists for the 1930s, so there will be little difficulty in finding information. Letters, memoirs, oral histories, newspapers from organizations of the unemployed, publications by leftist political parties, studies of the unemployed conducted at the time, government hearings on unemployment, and government-sponsored studies of relief efforts are just some of the sources available. The 1930s are a “historian’s playground,” so to speak, arguably to a degree unmatched by other periods. There is also a rich historiography on the Great Depression that I’ll be able to draw from—although most of the scholarship is not focused on the jobless in particular.

Another reason for my choice is that I think the world is now entering a period that will prove to have more than superficial resemblance to the Depression. History never exactly repeats itself, but it does “rhyme” (as Mark Twain supposedly said). As global economic stagnation worsens, millions more people in the U.S. will be thrown out of work and left to fend for themselves, especially with the federal government shedding its former obligations to the citizenry under the pressure of “austerity” politics.¹ One can expect increasingly many people to become as desperate as millions were in the early 1930s, when the jobless participated daily in mass actions across the country. The issue of unemployment will thus be forced onto the public agenda, although what will come of this cannot be predicted with any certainty. The point is that analyses of previous depressions, and of popular responses to being rendered “economically redundant,” will surely become more timely and urgent than ever in the last eighty years. To study the struggles of the earlier jobless might even prove to be of practical use to activists in the present.

A third reason—closely related to the second—for my interest in the Depression is precisely that it was a time of unprecedented activism by the unemployed. It’s true that in previous depressions the jobless had mobilized, for example when “Coxey’s Army” marched to Washington, D.C. in 1894, but the scale and the sustained nature of protest in the 1930s were more impressive than in the past. Reading such newspapers as the *Chicago Hunger Fighter*, the *New Frontier*, the *Unemployed Citizen*, the *Unemployed News*, the *Cry for Justice*, the *Vanguard*, the *Workers Alliance*, and countless others—all of them written for, and many by, the unemployed—one is struck both by the sophistication of political analysis and by the extent of reported activism: continual protest marches in every major city and region of the country; innovative self-help movements from the west coast to the east; frequent anti-eviction “riots”; a proliferation of Unemployed Councils, Workers’ Committees, Unemployed Leagues, and so on. For the historian, in fact, it’s an embarrassment of riches. One can imagine getting lost in such an overabundance of material.

To prevent that from happening I’ll stick to a specific theme and line of argument. In brief, I want to explore some of the ways in which the jobless exhibited “agency” in opposition to mainstream society and politics. I don’t think there’s enough emphasis in most historiography on the degree to which society is held together (tenuously) by *coercion* rather than *consent*—or on the fact that most people are not politically, culturally, or ideologically very integrated into the dominant social order. Certainly in mainstream culture there is an overemphasis on the supposed coherence of society, on, e.g., the supposedly capitalist, politically centrist values and practices of ordinary people. But even in contemporary historical scholarship, the great interest in discourses, social constructions, subjective identities, and cultural phenomena of all sorts tends to entail an extreme, idealistic version of Gramscianism—viz., the idea that

¹ This prediction shouldn’t be controversial. It is the common sense of critical economists like Robert Brenner, David Harvey, Richard Wolff, John Bellamy Foster, Dean Baker, Nouriel Roubini, even the impeccably mainstream Paul Krugman.

insofar as societies are relatively stable, it is because mainstream culture serves as a powerful glue.¹ For the postmodernist, after all, social life is reducible to language, discourse, images, etc.; thus, if a society does not disintegrate, it must be because its denizens accept the predominant discourses. This conclusion is rarely articulated, but one is committed to it inasmuch as one accepts the idealistic postmodernist framework.

It seems to me, instead, that such factors as brute force and fear, “the dull compulsion of economic relations” (to quote Marx), and the ruling class’s use of economic and political strategies to combat popular power are primarily responsible for the fact that capitalist society stays somewhat intact.² “Discourses” are of less significance. If this is true, it leaves a lot of analytical room for popular initiative, resistance to power-structures, working-class solidarity, oppositional subcultures, and so forth—only these things are suppressed, again and again, by the ruling class, as they ultimately were in the 1930s. One of my purposes in the dissertation, therefore, is to illustrate this general point, that the rule of the powerful is founded on the suppression of anti-capitalist values and practices that continually reappear among the population, such as “mutualism,” concern for others, an egalitarian and democratic ethos—in fact an anarchist ethos—and collective resistance to oppression. A number of labor historians have substantiated this point, at least implicitly, in their research over the last fifty years, but rarely in relation to the unemployed as such.

So, in part I intend the dissertation to have a polemical purpose. I want to put the focus back on old insights, on historical materialism and on resistance to capitalism (surely a timely subject). It’s useful, sometimes, not just to “neutrally” describe society in all its complexity but to point out general tendencies and illustrate them by examples. And the struggle—always implicit, sometimes explicit—between the relatively powerful and the relatively powerless, first and foremost in the economic sphere, is one such tendency, perhaps the most important. One of the main tasks of the historian, for both ethical and “scientific” reasons, should be to highlight and illuminate this struggle. As I’ll describe below, therefore, I’ll devote part of chapter three (and maybe the introduction) to arguing against the common perception mentioned above, that most people in a given society do not have an oppositional consciousness vis-à-vis the dominant classes and ideologies. As applied to the 1930s, this view is given sophisticated expression in a 1986 essay by Melvyn Dubofsky called “Not So ‘Turbulent Years’: A New Look at the 1930s.”³ Thus, I’ll contest Dubofsky’s position in chapter three and implicitly throughout the dissertation, by demonstrating the agency, solidarity, and rebelliousness of many among the unemployed.

In a sense it won’t be difficult to make such an argument, because for much of the thirties the country pullulated with protest actions and organizations. On the other hand, the number of militant jobless was always a minority of the total, far outnumbered by the people who simply did what they had to do to survive. It will be tricky to investigate their political consciousness; I’ll have to use oral histories, clues from popular culture, memoirs, and letters (of which several collections have been published, in addition to the thousands of letters that exist in archives I’ll visit). Doubtless much of the evidence will conflict with a romantic radical’s idealization of the masses’ social and political consciousness. Nevertheless, I expect to be able to strike a balance, perhaps even leaning toward the “romantic” side, between the conventional notion of the unemployed’s “apathy” and an overestimation of the leftist character of their values and beliefs.

My focus will be on the unemployed in Chicago from the early to the late 1930s, but I’ll make frequent, and in some cases sustained, reference to other regions of the country. Chicago was central to the unemployed movement in the Great Depression, in terms of sheer numbers (tens of thousands were organized), the militancy of the rank and file, and the many victories won there by the Unemployed Council and the Workers’ Committee (each with dozens of locals in the city)—the first organized by the Communist

¹ Gramsci himself was a subtle and complicated thinker; I use the term “Gramscianism” only as a convenient label to indicate a certain trend of thought.

² See Nicholas Abercrombie, Stephen Hill, and Bryan Turner, *The Dominant Ideology Thesis* (London: George Allen & Unwin, 1980), and Patricia Cayo Sexton, *The War on Labor and the Left: Understanding America’s Unique Conservatism* (Boulder, CO: Westview Press, Inc., 1991).

Party and the second by the Socialist. More broadly, the Midwest seems like a reasonable place to concentrate on, in light of the high rates of unemployment in this center of industry.

[Deleted the rest.]

*

It's always a joy to come home for the holidays. [...] This time I've been given the gift of labyrinthitis, or something like it. Constant dizziness and slight queasiness, and no energy. Confined to bed for six days so far (with a day-long exception in the middle). Some virus, probably. Apparently the symptoms can last for weeks or months, or sometimes even years. It's hard to imagine not losing one's sanity in that case.

...The torture is pretty much over, thank God! The dizziness is mostly gone. Probably just because I drank a crapload of water today and took some decongestants. A week of semi-hell really makes you appreciate not being in hell. It's sad that we so take for granted the simple pleasures of life, like being able to see and walk and think without obstruction. What a remarkable thing is the body, an exquisitely tuned instrument that goes out of whack if just a minuscule part of the inner ear loses its equilibrium. Your entire being is wrecked by a tiny tubule being inflamed. Astonishing, incomprehensible beauty, the body! How wonderful ordinary life is!

January–April, 2014

When I turn from Göran Therborn's book *From Marxism to Post-Marxism?* (2008) to the one I've almost finished writing, it's like going from a foggy to a sunny day. All confusion with no clear vision versus clarity and sure-footedness. There is much of value in Therborn's book, but on the whole it's time for the old academic Marxists to fade away. Most of them have no sweeping historical vision and little theoretic ambitiousness or originality; in some ways they're stuck in the past, and they have no imagination. Also their writings tend to be pretentious and elitist.

My book is ten times better than my Masters thesis.

Still haven't reacquired my old love of academic reading. For months and months I've been sick of it.

One of the books I'd like to write someday is a comprehensive investigation of stupidity. Particularly stupidity in the realm of thought. Want to demonstrate its ubiquity, from politics to philosophy and so forth, and then try to explain it in various ways, using biology, psychology, and commonsense reasoning. It's just astonishing how *bad* people are at nearly all kinds of thinking (including empathy, etc.), and I want to understand this. In part it's a result of contemporary social structures, but in part there must be biological and psychological causes.

I'm not talking about things that require real talents, such as quantum physics or hyper-abstract philosophical reasoning or even being good at reading maps. I'm talking about common sense. Very few celebrated philosophers have philosophical common sense (for instance, they ask idiotic questions like "Can computers think?" or "Can computers understand language?," etc.); radical feminists and postmodernists have utterly stupid ideas about biology's irrelevance to gender norms or the mind being a nearly blank slate; intellectuals have idiotic conceptions of how politics works, and they have no institutional self-understanding; Leninists think it's possible for "the working class" to take over the national state, while anarchists are convinced that if only the state were abolished things would be great. And then there's the political right wing, and ordinary people everywhere. Wherever I turn, I'm suffocated by this miasma of stupidity. Up to a point it doesn't bother me, but, sometimes, it does get annoying and alienating to feel like one of the few truly sane people on the planet. (Luckily there's Chomsky.)

I've been reading *No Gods, No Masters*, an anthology of anarchism edited by Daniel Guerin. But the writings aren't very interesting. They haven't aged nearly as well as Marx's major works (or some of Engels'). When they're not full of confusions and sloppy thinking (Stirner, Proudhon), most of them are

just repetitive elaborations of the intuition that centralized power is bad, and airy speculations on how to organize a good society. Doubtless these speculations and plans are of moral value; in 2014, though, they're a bit dated.

Part of the problem, too, is that I'm bored with reading. All reading. Can't seem to stay interested in any book.

As I do research for my dissertation, I need some side-project to sustain me. For a long time I've wanted to write a book on the psychological and sociological dimensions of the left-right political spectrum (discussing the "authoritarian personality" and so on), but that may be too ambitious for a side-project. But what other book could I write? Maybe I could try that idea of interviewing homeless people, since homelessness is becoming a major issue and apparently there are no Studs Terkel-esque books on it. But I want to do something *creative* too. How can I possibly immerse myself in mere dissertation research for however-long-it-takes??

Two pieces of good news. First, I did the prospectus defense and passed, so now I'm officially "ABD." [...]

Also, I finished the co-ops book. (Completely rewrote the last three chapters of the thesis and edited the first three.) Did some interviews with the worker-owners of New Era Windows in Chicago, wrote that chapter, and sent the thing off to AK Press. I feel liberated!—at least for the moment. Can move on to other things now.

...Weirdly, I haven't yet read the very important book *Poor People's Movements* (1977), by Frances Fox Piven and Richard Cloward, only skimmed a few parts. Reading it now. —I find that, if I have a positive attitude, good books are still, after all, a pleasure to read. Even the less good ones can still be a pleasure if I shed the "impatient" attitude I've had for over a year of only wanting to *write*.

Speaking of which, I'm going to resume my old habit of writing random thoughts and summaries of good books, to put together another book sort of like my first one, *Notes of an Underground Humanist*. I might have to end up self-publishing it again, since publishers are rarely interested in honest and original books, but if self-publishing was good enough for Nietzsche, then it's good enough for me.

Taking the Greyhound bus to New York City to do research for the dissertation. At the Tamiment Library at NYU.

It seems that the older I get, the more I'm in awe of myself as a lone voice of reason against every kind of idiocy and conformism. The new book I'm writing confirms that.

Predictably, I've been much happier this semester than last, since I've had creative projects to devote myself to. I recall being lonely and a little bitter last semester, but whenever I have something to do those moods vanish.

May

For a couple weeks I was close to abandoning the dissertation and starting a new phase of my life without getting the Ph.D. Was seriously thinking about it, because I just couldn't see myself writing this damn thing. Ed Hunt sent me a few good emails, though, and my parents strongly encouraged me to continue, and finally Zhilan and her daughter gave me a long pep talk practically demanding that I get a Ph.D.—and I took a short vacation with them at Starved Rock State Park—so when I returned I got back to it and have been making slow but steady progress. Once you fully immerse yourself in it, this chapter I'm writing (the fourth) is actually kind of fun, however difficult and slow this sort of writing is for me.

I'm also writing an in-depth timeline of U.S. labor history for the Hull House, which they're going to hire professionals to make an interactive thing on their website. It'll have two parts, one a series of events

and the other to provide social and economic context. Here's the first part, which I did with the help of the internet:

1866: Founding of the National Labor Union

The NLU is the first national labor federation in the United States, dedicated in large part to fighting for the eight-hour day. This goal is not achieved nationally, though in 1868 Congress does establish the eight-hour day for government employees (a law not consistently enforced). The organization falls apart during the depression of the 1870s.

1869: Founding of the Knights of Labor

This nationwide organization grows in the 1870s as the NLU fades; by 1886, in the wake of major victories in strikes against railroad companies, it has 800,000 members. Its long-term aim is to bring about a cooperative commonwealth of labor in the United States, in which the wages system would be abolished and workers would control their own work. More immediately, it fights for the eight-hour day, higher wages, women's economic rights, racial equality, laws against child labor, and industrial unionism (according to which all workers in the same industry are organized into one union rather than separated by skill-level and occupations, as in craft unionism). It also facilitates the establishment of hundreds of worker cooperatives around the country.

Summer, 1877: the Great Railroad Strike, a.k.a. the Great Upheaval

In response to wage cuts, depression, unemployment, and savage treatment by capitalists, spontaneous strikes spread along railway lines from West Virginia to cities in Maryland, Pennsylvania, Illinois, Missouri, and other states. By the time the colossal strike is crushed by state militias, police forces, and federal troops—after 45 days of fierce resistance by workers—a hundred people have been killed and 100,000 workers have gone on strike. Despite its defeat in 1877 by the combined forces of private power and government, the labor movement continues to grow rapidly in the 1880s.

May 4, 1886: Haymarket bombing in Chicago

At a rally in support of the national movement for an eight-hour day—a movement that has inspired half a million workers to go on strike on May 1, 1886—an unidentified person throws a bomb into the crowd that kills seven policemen and several civilians. In a subsequent trial much criticized for its lack of objectivity, eight anarchists are convicted of conspiracy (though not of throwing the bomb), seven of whom are sentenced to death. The bombing triggers a nationwide crackdown on the militant labor movement, dealing a tremendous blow to the Knights of Labor and the revolutionary hopes it symbolized.

December, 1886: Formation of the American Federation of Labor

The AFL is founded as a craft-union-based alternative to the Knights of Labor, and accordingly takes a relatively conservative approach to labor activism. It eschews “social movement unionism” and opposition to capitalism as such, focusing instead on bread-and-butter issues like wages and other incremental demands that can be won through collective bargaining. As the Knights of Labor collapses, the AFL slowly grows to encompass millions of (mostly skilled) workers.

July 2, 1890: Passage of the Sherman Anti-Trust Act

This law is intended to prohibit business activities that interfere with free competition. In one of history's many ironies, though, it is frequently used to justify injunctions against union activities, such as strikes, that are said to interfere with competition.

Summer, 1892: Homestead strike

In an attempt to destroy the Amalgamated Association of Iron and Steel Workers (AA), the powerful union of skilled workers at the Carnegie steel plant in Homestead, Pennsylvania, Henry Clay Frick locks them out of the plant. Other workers in the plant and town then go on strike in solidarity with their

fellows. The conflict escalates as Frick tries to break the strike with the help of 300 Pinkerton “detectives”—effectively a private army—but a bloody battle ensues between them and the townspeople of Homestead. The strike is finally defeated after the governor dispatches a militia against the workers, with the further result that the AA’s power in the industry is broken. For the next forty years, the steel industry will remain essentially non-union.

Summer, 1894: Pullman strike

Factory employees of the Pullman Company in Chicago go on strike to protest their low wages and abysmal treatment by George Pullman. In solidarity, Eugene Debs and his American Railway Union declare a boycott of all trains carrying Pullman cars; at its peak, the boycott involves 250,000 workers. President Grover Cleveland sends troops to Chicago to get the trains moving again, which infuriates the strikers, who react with violence. At length the army is able to subdue the workers (at the cost of many lives) and end the strike, which results in the dissolution of the American Railway Union and the arrest of its leaders for violating a federal injunction against the strike.

1905: the Industrial Workers of the World is formed

Despite its many defeats, the militant wing of the labor movement remains unbowed. It forms the IWW as a radical, anarcho-syndicalist alternative to the more conservative AFL, and organizes workers along class lines rather than occupational lines. It is the only union at the time to welcome *all* people into its ranks, including immigrants, women, and African-Americans. Before it loses influence during the waves of government repression that follow World War I, it plays a major role in campaigns for free speech and in some of the era’s most important industrial conflicts.

1909: Shirtwaist strike in New York

Workers in the garment industry, which employs primarily young women, vote for a general strike against low pay, long hours, awful working conditions, and discrimination for union activity. Led mostly by rank-and-file women, the strike of almost thirty thousand lasts eleven weeks. Finally employers give in to most of the workers’ demands, including a shorter week, no discrimination against union loyalists, and negotiation of wages with employees. The groundwork for industrial unionism is laid in the garment industry as the International Ladies Garment Workers Union gains thousands of members, proving to conservative AFL leaders that a multi-ethnic, immigrant, female workforce is worth organizing.

March 25, 1911: Triangle Shirtwaist factory fire in New York City

Locked inside the factory by its owners, 146 garment workers (mostly young women) die during the fire, many by jumping to their deaths from the ninth and tenth floors. While the factory’s owners are not convicted of any crime, the incident leads to new safety regulations and a modernization of New York’s labor laws.

January–March, 1912: Textile strike in Lawrence, Massachusetts

More than twenty thousand workers, again primarily women and girls, walk out of the mills in response to a pay cut. The IWW takes over leadership of the strike and establishes several innovative practices, such as sending strikers’ children to sympathizers in other states who will temporarily care for them. The police beat mothers, children, and pregnant women, which so inflames national sentiment that Congress holds investigative hearings that reveal the terrible conditions at the Lawrence mills. Eventually the company agrees to nearly all the workers’ demands, thus furthering the unionization of the garment industry.

April 20, 1914: Ludlow massacre

This event is the climax of the deadliest strike in U.S. history, called by the United Mine Workers in 1913 to protest horrific conditions at John D. Rockefeller’s mines in Colorado. For months, company-instigated violence failed to break the will of the strikers and their families. On April 20, the National Guard

and local militiamen attack the strikers' tent colony with machine guns (killing several people), then set fire to the tents as workers and their families flee. Eleven children and two women suffocate and burn to death under one of the tents. Ultimately the strike is lost, but the government commission that investigates the massacre provides support for many union demands, such as the eight-hour day and abolition of child labor.

1916: Congress passes the Adamson Act

This law establishes the eight-hour day for railroad workers, with additional pay for overtime work. It is the first federal law to regulate hours of work in private companies.

1919: Postwar strike wave

Following World War I, four million workers go on strike for higher wages and better working conditions. The response by business and government is the "Red Scare," or demonization of strikers as Communists. The violent repression of the strikes presages a decade of terrible setbacks for labor, which end only with the upsurge of popular protest in the Great Depression.

1932: Norris-La Guardia Act is passed

This law bans "yellow-dog contracts," which stipulate that an employee cannot join a union during the course of his employment, and forbids federal courts from issuing injunctions against nonviolent labor disputes such as strikes. It is a great victory for organized labor, anticipating the more comprehensive Wagner Act of 1935.

April–June, 1934: Toledo Auto-Lite strike

Led by the small American Workers Party, and with the decisive help of class-conscious unemployed workers, employees of an auto parts plant in Toledo, Ohio walk off the job to achieve union recognition, improved working conditions, and a wage increase. The strike lasts almost two months and survives a five-day battle between workers and thousands of police and National Guard troops (a battle in which hundreds are injured and several killed). Under the threat of a general strike, Auto-Lite finally agrees to nearly all the union's demands. This victory leads to the rapid unionization of other workplaces in Toledo.

May–August, 1934: Minneapolis Teamsters strike

Local 574 of the International Brotherhood of Teamsters strikes for union recognition and its right to speak for all of its members. The city's commerce virtually shuts down as trucking operations come to a halt. Serving, as usual, as the business community's enforcers, the police violently but fruitlessly attempt to break the strike. After weeks of virtual civil war, employers finally give in to the union's demands—a victory that sets the Teamsters up to eventually become a major national union.

May–July, 1934: West Coast waterfront strike

First longshoremen, then sailors and other maritime workers, in every port on the West Coast go on strike for union recognition, a coast-wide contract, and a union-controlled hiring hall. After a brutal police action a couple months into the strike, dozens of unions in San Francisco vote for a general strike, which lasts four days. The dispute finally goes to arbitration, which hands the maritime workers several victories: for example, the International Longshoremen's Association gains substantial control over hiring on the docks, employees' wages increase, and shift hours are reduced.

September, 1934: Textile workers strike

Under the leadership of the United Textile Workers, 400,000 workers from New England to the South go on strike for a thirty-hour week, a minimum wage, union recognition, and better working conditions. "Flying squadrons" travel from plant to plant, calling workers out. In response, employers call on local and state authorities, who send the police and National Guard to wage near-war on the strikers

(especially in the South). At length the UTW calls off the strike, which ends in total failure. For the rest of the century the South remains largely un-unionized, despite CIO efforts to organize it.

July, 1935: Franklin Roosevelt signs the National Labor Relations Act into law

One of the U.S. labor movement's greatest victories, the NLRA (otherwise known as the Wagner Act) guarantees the right of private-sector employees to organize into unions and bargain collectively, and to strike. It forbids discrimination against workers for engaging in union activity or filing charges against their employer. For purposes of enforcement it establishes the National Labor Relations Board, which oversees elections for union representation and investigates charges of unfair labor practices.

August, 1935: Roosevelt signs the Social Security Act

This law creates the foundation of the modern U.S. welfare state, by providing federal assistance for the elderly, unemployment insurance, and assistance to children whose families have low income. In later years, particularly the 1960s, the law's provisions are made more generous, though still not comparable to the generosity of many European welfare systems.

November, 1935: the Committee for Industrial Organization is formed

Later called the Congress of Industrial Organizations (CIO), its purpose is to do what the AFL has failed to do: organize workers in the mass-production industries, such as automobile and steel production, into one big union each. In the following years, such iconic mass unions as the United Autoworkers, the United Electrical Workers, the United Steelworkers, and the United Packinghouse Workers achieve unprecedented successes in their respective industries, and the CIO, having left the AFL, grows to encompass millions of workers by the late 1940s. At long last, the "industrial unionism" dream of the Knights of Labor and the IWW has to some extent been realized.

Winter, 1936-37: Sit-down strike against General Motors in Flint, Michigan

One of the most celebrated events in U.S. labor history, this strike leads to the unionization of much of the automobile industry and thereby the first major victory of the newly formed CIO. The new tactic of occupying the factory—rather than forming a picket line outside—is used to prevent the company from using strikebreakers and to make it harder for police to break up the strike. Within six weeks GM realizes it has no choice but to negotiate with the UAW; the resultant contract gives the union such prestige that in one year it gains 500,000 members.

March 2, 1937: U.S. Steel concedes the unionization of its employees

Since the summer of 1936, the Steel Workers Organizing Committee (SWOC) (of the CIO) has been signing up thousands of steel workers as members, in the first stage of its drive to organize the steel industry. Early in 1937 the head of U.S. Steel, Myron Taylor, secretly meets with John L. Lewis, head of the CIO, and agrees not only to recognize SWOC as a bargaining agent but also to an eight-hour day for employees, a wage increase, seniority protection, and a grievance procedure. These astonishing concessions are due to Taylor's desire to avoid a strike at a time when Europe is preparing for war and needs to import steel.

May 30, 1937: Memorial Day massacre in Chicago

Chicago police shoot and kill ten unarmed demonstrators (injuring many others) in a crowd of hundreds who have gathered to protest the refusal of small steel manufacturers to negotiate with SWOC. No policeman is prosecuted.

1938: Fair Labor Standards Act is passed

In a sense the culmination of decades of activism, this law mandates an eight-hour day and forty-hour week (with "time-and-a-half" for overtime), the abolition of child labor, and a national minimum wage. It applies to employees whose work relates to interstate commerce. In subsequent decades the law is

expanded and improved upon many times, for instance by raising the federal minimum wage and by expanding coverage to some farm workers (in 1966).

1945-46: Postwar strike wave

After the conclusion of World War II, six million workers in the railroad, coal, automobile, oil, steel, electrical, maritime, and telephone industries go on strike—the largest strike wave in U.S. history. The pent-up frustrations of the war years, primary among them wage grievances, erupt in this rank-and-file upsurge met by repression that is not nearly as serious as in 1919. The workers win many of their less-radical demands, but the settlements negotiated by unions, companies, and the federal government set the stage for the conservative “liberal consensus” of the 1950s.

June 23, 1947: Congress passes the Taft-Hartley Act

Perhaps the most significant event in the early backlash against the New Deal and its empowerment of unions, the passage of the Taft-Hartley Act rolls back many of the advances labor has gained by the Wagner Act. It prohibits secondary strikes and boycotts, wildcat strikes, strikes by federal employees, and the “closed shop,” and allows states to pass “right-to-work” laws that ban the “union shop” (in which newly hired employees must become union members within a specified period of time). It also requires union leaders to sign affidavits saying they are not members of the Communist Party, a requirement that effectively purges many of the most militant activists from unions and contributes to the anti-Communist hysteria of the postwar years.

1955: Merger of the AFL and the CIO

In the context of the Cold War, the AFL-CIO is a conservative, bureaucratic organization that shows none of the social movement mentality of the CIO in the 1930s. Under George Meany, it supports U.S. imperialism in Vietnam and Latin America, and takes a generally conservative stance on the civil rights movement and feminism. Later, under Lane Kirkland in the 1980s, it is largely ineffectual in defending workers and unions from conservative attacks.

January 17, 1962: Federal employees win the right to collectively bargain

This landmark executive order signed by John F. Kennedy is a factor in the explosive growth of public-sector unionism in the 1960s and 1970s, as many states follow Kennedy’s example and permit state employees to unionize. The number of public-sector strikes also dramatically increases, even in cases where they are illegal.

June 10, 1963: Kennedy signs the Equal Pay Act

An amendment to the Fair Labor Standards Act, this law is intended to end wage disparities between the sexes. It prohibits sex discrimination in the payment of wages, thus allowing women’s pay to rise dramatically in the next fifty years (though on average it remains lower than men’s).

July 2, 1964: Lyndon Johnson signs the Civil Rights Act

Title VII of this Act outlaws workplace discrimination on the basis of race, sex, religion, or national origin (age and disability being added later).

Late 1960s–1970s: United Farm Workers organizes workers in California

Under the leadership of César Chávez, the UFW does what Saul Alinsky thought impossible: it organizes tens of thousands of farm workers and forces growers to sign union contracts. This is achieved through such unconventional tactics as mass boycotts (by 1975, 17 million Americans are boycotting grapes), hunger strikes, marches, and community organizing. In 1975 the Agricultural Labor Relations Act passes in California, guaranteeing farm workers the right to organize, bargain with employers, and vote in state-supervised union elections.

December 29, 1970: Occupational Safety and Health Act becomes law

Before this law, government's attention to issues of workplace safety has been scattered and minimal. Thousands of workers were killed in the workplace each year, and millions were harmed or disabled. The OSH Act establishes an infrastructure (the OSH Administration, or OSHA) to enforce health and safety regulations.

August, 1981: Air Traffic Controllers strike

The Professional Air Traffic Controllers Organization (PATCO) goes on strike for better working conditions and higher pay. President Reagan fires the 11,000 employees who have ignored his order to return to work, essentially destroying PATCO and signaling to employers that it's open season on unions. In the 1980s, the federal government stops enforcing many of the Wagner Act's provisions to protect workers and unions.

1985: Hormel Foods strike

In one of the longest strikes of the 1980s (lasting ten months), Hormel workers in Austin, Minnesota take a stand against the epidemic of wage cuts occurring in the U.S. manufacturing and food industries. The strike becomes a media sensation and leads to a national boycott of Hormel products, but in the end the workers cannot hold out against the opposition of their parent union (the United Food and Commercial Workers) and Hormel's determination to defeat them.

Late 1980s: SEIU's Justice for Janitors campaign begins

One of the most successful organizing campaigns in recent history, it has its first major victories in Los Angeles and spreads around the country in the succeeding decades. It uses many of the tactics of the United Farmworkers, which draw media attention. The campaign succeeds in raising wages for many thousands of janitors and improving their working conditions.

December 8, 1993: Bill Clinton signs NAFTA into law

The North American Free Trade Agreement between the U.S., Canada, and Mexico continues the neoliberal attack on workers and unions (under the guise of promoting "free markets"). By cutting back numerous regulations and social protections, in the next twenty years it contributes to record income inequality in North America, wage cuts, the loss of a million U.S. jobs, unions' catastrophic loss of power, the decimation of Mexico's peasantry and resultant influx of immigrants into the U.S., and the erosion of environmental protections. (See the Public Citizen's Global Trade Watch report "NAFTA's 20-Year Legacy," at www.citizen.org.)

November 30–December 1, 1999: Seattle protests occur against the World Trade Organization

Tens of thousands of protesters, including trade unionists, environmentalists, students, and representatives of many left-wing groups, demonstrate and march through the streets of Seattle as the WTO meets downtown. The first major U.S. protest against corporate globalization, it provokes a savage response by the Seattle police force and hostile treatment by the media. Nonetheless, it successfully disrupts WTO negotiations and forces the mainstream media to acknowledge the alter-globalization movement.

February–June, 2011: Protests in Madison, Wisconsin

Over a hundred thousand people demonstrate in and around the Capitol building in protest against Governor Scott Walker's bill to strip public employees (excluding police and firefighters) of the right to collectively bargain over pensions, health care, hours, safety, sick leave, and vacations, and to limit their pay raises, in addition to ending automatic union dues collection by the state. The bill passes and subsequently survives legal challenges. In the following years anti-union measures continue to pass in other states, as when Michigan and Indiana become "right-to-work" states in 2012.

Fall, 2011: Occupy Wall Street

While not strictly a labor action, this series of protests initiating in New York City and spreading around the world continues the post-NAFTA tradition of organized labor's allying itself with other progressive forces to achieve common ends. The immediate target of OWS is the growing income inequality in the U.S., but more fundamentally it is directed against the very political economy of neoliberalism. On November 15 the New York protesters are forcibly evicted from Zuccotti Park, and similar crackdowns are coordinated across the country. Nevertheless, OWS succeeds in putting the issue of economic inequality onto the public agenda.

September, 2012: Chicago Teachers Union strike

Rejecting the paradigm of narrow "business unionism" and concessionary bargaining that most unions have followed in recent decades, the CTU embraces a militant, social-movement strategy to fight back against the national assault on public schools and teachers' unions. Having painstakingly built up community support for teachers and students, the CTU is able to mobilize many thousands of people in picket lines and protest marches through the streets of Chicago to fight for improved public education. Drawing international attention, the strike makes possible what is widely considered a victory for the union in its contract negotiations with the Chicago Public School system.

*

Sent Chomsky an email: "Hi. I take it you don't think that "compatibilism" provides any solution to the mystery of free will, right? Have you written about compatibilism anywhere? It certainly seems to me that the ideas of free will and of deterministic neural processes that produce consciousness are in conflict, but many philosophers seem to disagree... (Which is weird. Do you understand how they can think that determinism and free will are perfectly compatible?? Surely there are two options: either you're free, or you're determined. Right?)" His answer: "Agreed."

Going to Paris for the summer on June 4. Thank God for that option. Some people are stuck in this country without any recourse! Presumably I'll come back in August—or maybe I'll take a semester off, or who knows... My plans for doing a home-stay with a French family fell through, so now I'm just going to Paris on a wing and a prayer. Which will probably be more fun anyway. Going to find an apartment to rent and take it from there. Studying French this month.

June, July

Another phase of life ending and a new one beginning... Moved out of my four-year apartment (will find a different one in the fall, if/when I come back to Chicago). Nine or ten weeks in Paris isn't much, but hopefully it'll rejuvenate me a little. I'm storing most of my things in Zhilan's apartment. I'll kind of miss her and her brilliant daughter Lulu this summer, by the way. For a long time I've spent pretty much every weekend in their apartment (helped them move to a new, better one closer to downtown in February), and sometimes weekdays too. I have a few decent friends in Chicago [...], but on the whole my acquaintanceships are pretty shallow. So the only people who have been deeply in my life are Zhilan and Lulu.

...In Paris. Stayed at a hostel in Montmartre for a couple days; now I'm at the home of a girl I found through the Couchsurfing website, who offered to let me stay for six days, until I can move in to the apartment I found. It's in the fifteenth arrondissement and costs only 800 euros for the whole summer! Incredible. It's tiny, but it has all the necessities and is in a good location.

[...] It was probably stupid of me to come here. You don't truly appreciate things until you lose them for a while. I even miss Chicago a little, or its comforting familiarity. And Lulu and Zhilan. If nothing else, this trip has cured me, for a long time, of restlessness. All I really want now is "domestic bliss"—a wife, maybe children, a stable job. Three things I won't get.

Wise words from Lulu: “mmmmhmmmmmmmm, i told you, it is absolutely retarded for your future to go to paris, first you need to do your dissertation, and then you need to be focusing on finding a TA job. And you cant do that in Paris. You also need to find a new apartment in Chicago, and you cant do that in another country, You dont think before doing. Paris sounds like PARIS to u, and you forgot what paris REALLY is and all your worries in Chicago. Tisk Tisk. Btw this is lulu, just saying, my mom wouldn't say this to you, im on her email.” But I was depressed and lonely in Chicago, desperate for a change.

...So, here's an interesting development: the woman from whom I rented the apartment, to whom I gave 800 euros (for two months), scammed me, along with two other people. She rented it to three people at the same time. The two others showed up yesterday, and after talking to the landlord—whom she scammed too—he agreed to let them stay for a while. I showed up today, so it was too late; the place has already been given to them. (One woman has it for two weeks, the other for a month.) Maybe I acted stupidly, but I truly had no reason to suspect this woman's intentions. She seemed totally legitimate: gave me the keys, wrote up a contract, was very friendly, etc. I guess I assumed she wasn't capable of such depravity. So now I'm out 800 euros, and I have nowhere to stay. I'm tired of lugging my luggage around the city, going to a hostel here, a couchsurfer there, another hostel there...

On a brighter note, I went to a concert tonight in a theater on the Champs-Elysees, with a Parisienne from OkCupid. Rossini's *La scala di seta*. Tomorrow I'm meeting another girl, then the next day going to a picnic, then the next two days two other girls.

Poor Zhilan. My heart aches for her, for her probably lonely future. It's going to be very hard for her to accept that we're just friends now. She sent me this email today:

I am desperate right now. Just thinking three years close relationship with you, and you wanted me to be just a friend with you now.

We met in a galley, We traveled 30 minutes to just kiss each other 15 minutes, you babysittered little lulu ...Just look at how happy we were in those subway pictures..my love for you is in my paintings, you were and will be my muse to my art...gosh, I don't think I will have all those beautiful memory with any other man in my later life. The best part of my life—full of youth, beauty and hope will be gone, when we say goodbye to each other. [...]

The world is full of such pain. And getting older in itself can be such a painful process—thinking of past pleasures and present worries.

Exactly a month after going to Paris I returned to the U.S. Sitting in the LaGuardia airport now, waiting to fly to Chicago, where I'll stay with Zhilan until I find an apartment. Visited Emily in Berlin, had some interesting experiences (e.g., almost got into a fight with a buffoonish drunk German xenophobe who was remarkably offended that I was American). But I was rather lonely in Paris, and it's just not much fun to experience such a city alone (notwithstanding the friends I made). Missed Lulu and Zhilan, and I decided I should get back to the dissertation research, since the Paris vacation was going nowhere. I'm glad I went, though, for many reasons. And even though the U.S. disgusts me, it's my home—mainly because I only speak English. I can't very well live abroad.

August–November

Spent the night with a girl I met on OkCupid, Gloria, pretty, intelligent, 24 years old. Works as a consultant at Loews; regaled me with tales of the absurdity of the corporate world. First time meeting her; we had a great conversation at a wine bar and then proceeded to her apartment ten minutes away, where things heated up. A passionate young woman who clearly enjoys casual sex. I didn't get a wink of sleep. But I don't know if we'll see each other again; it seemed like only a one-night stand.

To get periodic respite from the tedium of history writing, I've decided to start reading philosophy again. I really miss it; it can be much more stimulating than academic history. Starting with ethics: Alasdair MacIntyre's famous book *After Virtue* (1981)—which I'm finding to be deeply flawed, even ridiculous in places, but very thought-provoking. I'm also publishing my third book, called *Finding Our Compass: Reflections on a World in Crisis*. (First part of the title from Dad, again.) If anybody in my department reads it I'm doomed, because it's extremely critical of intellectuals and academia; but there are more than enough conforming cowards in the world, not enough people with the balls to tell the truth.

As for Zhilan and Lulu: the former, amazingly, found a new boyfriend a couple months ago, a young Jewish pianist who teaches at a college. Things seem to be going pretty well with them, so far; they tell each other they're in love and so on, and he just invited her to a wedding. I still spend a day or two at her place every weekend, mainly to talk to and 'mentor' Lulu. Brilliant, charismatic girl. She has a bright future ahead of her.

Now I'm reading G. E. M. de Ste. Croix's massive book *The Class Struggle in the Ancient Greek World, from the Archaic Age to the Arab Conquests* (1982). Also Christine Korsgaard's *The Sources of Normativity* (1996). Taking notes on the former, to publish them in my next book. Once I've read enough books on ethics I'll write a paper or a couple chapters on it, drawing on the long paper I wrote years ago.

Also want to write a chapter or paper on the concept and reality of pretentiousness throughout history. It's much deeper and more socially interesting—and important—than people think. I included thoughts on it in my last book, but they were too condensed.

Random thought: I'd certainly be lonelier in Chicago—and I am lonely here—if it weren't for Lulu, who is much more interesting and fun than nearly all adults. Even if she can be rather unkind from time to time. She enjoys our intellectual conversations and, of course, being 12, isn't cursed with the pretentiousness that so many intellectuals are. There's a bond between us, of some sort. But maybe the most satisfying thing is to know that she'll get older and be a quite impressive person, and as a friend (probably) I'll be able to observe the process and influence it and make an impact on her life—as indeed I already have. In a world of artificiality and stupidity, one needs a few close bonds.

Here are my notes on Ste. Croix's book:

Thoughts on a Masterpiece

Some academic books are worth knowing about even if one doesn't have the time or inclination to read them. G. E. M. de Ste. Croix's *The Class Struggle in the Ancient Greek World, from the Archaic Age to the Arab Conquests* (1981) is one of those, far too massive and dense for even most intelligent laypeople to read but too valuable for them not to know about. It is almost impossibly rich, and deserves to last as long as intellectually curious people exist. For it does what very few historians not only do but are even interested in: it *profoundly explains*—an enormous period of history—rather than simply describes or “plays with texts” to “uncover new meanings” and “reveal contestations” over “discourses” that must then be “problematized” and so forth. It gets straight to the point unpretentiously, determined to make 1400 years of history comprehensible on the basis of a few simple concepts. And what are those concepts? Marxist ones, of course. Class, class struggle, and exploitation. Even if one hadn't read a single other Marxist work, this book would have to convince one of the value of Marxian methods—as it did many mainstream classicists when it was published, who reviewed it rapturously even when they had criticisms.

Since the application of Marxism to antiquity was virtually unknown when the book was published, being considered anachronistic, as if classes hadn't really existed then—a transparently ideological fantasy, but an understandably popular one in a capitalist society characterized by institutional (academic) fragmentation and the subordination of intellectuals to bourgeois habits of thought¹—Ste. Croix has to

¹ As Ste. Croix says, in criticism of historians who reject “all this theoretical stuff, about class structures and social relations and historical method,” “it is a serious error to suppose that unconsciousness of ideology, or even a complete lack of interest in it, is the same thing as absence of ideology. In reality each of us has an ideological approach to

devote some of the book to analysis of his main concepts. They're fairly intuitive. An economic *surplus* is "that part of an individual's labor of which he does not directly enjoy the fruit himself, and the immediate benefits of which are reserved for others."

Class (essentially a relationship) is the collective social expression of the fact of exploitation, the way in which exploitation is embodied in a social structure. By *exploitation* I mean the appropriation of part of the product of the labor of others [i.e., the surplus]: in a commodity-producing society this is the appropriation of what Marx called "surplus value."

A *class* (a particular class) is a group of persons in a community identified by their position in the whole system of social production, defined above all by their relationship (primarily in terms of the degree of ownership or control) to the conditions of production (that is to say, the means and labor of production) and to other classes...

It is of the essence of a *class society* that one or more of the smaller classes, in virtue of their control over the conditions of production (most commonly exercised through ownership of the means of production), will be able exploit—that is, to appropriate a surplus at the expense of—the larger classes, and thus constitute an economically and socially (and therefore probably also politically) superior class or classes. The exploitation may be direct and individual, as for example of wage-laborers, slaves, serfs, "coloni," tenant-farmers or debtors by particular employers, masters, landlords or moneylenders, or it may be indirect and collective, as when taxation, military conscription, forced labor or other services are exacted solely or disproportionately from a particular class or classes (small peasant freeholders, for instance) by a State dominated by a superior class.

I use the expression *class struggle* for the fundamental relationship between classes (and their respective individual members), involving essentially exploitation, or resistance to it. It does not necessarily involve collective action by a class as such, and it may or may not include activity on a political plane, although such political activity becomes increasingly probable when the tension of class struggle becomes acute...

Imperialism, involving some kind of economic and/or political subjection to a power outside the community, is a special case, in which the exploitation effected by the imperial power (in the form of tribute, for instance), or by its individual members, need not necessarily involve direct control of the conditions of production. In such a situation, however, the class struggle within the subject community is very likely to be affected, for example through support given by the imperial power or its agents to the exploiting class or classes within that community, if not by the acquisition by the imperial power or its individual members of control over the conditions of production in the subject community.¹

Doubtless some academic would quibble with these definitions, but one could make them more precise and perfectly defensible. The most controversial one would be that of class struggle, since it doesn't refer to class consciousness or explicit *struggle*. The struggle can be, and usually is, only implicit. That seems reasonable to me, in part because people among the exploited classes are constantly resisting or objecting to their position in small or large ways—and so actually the struggle is continually explicit, on an individual level if not a collective one—but also because logically there *is* a struggle, a clash, of interests between the

history, resulting in a particular historical methodology and set of general concepts, whether conscious or unconscious. To refuse—as so many do—to define or even to think about the basic concepts we employ simply results in our taking over without scrutiny, lock, stock and barrel, the prevailing ideology in which we happen to have been brought up..." (p. 34).

¹ The twentieth-century policies of the U.S. government with respect to Latin America are an excellent instance of both of these examples. When it (or members of its ruling class) didn't simply take control of property and the means of production, the U.S. regularly propped up the ruling classes.

exploiters and the exploited. The former's interest lies in extracting a greater surplus, the latter's in decreasing the size of the surplus extracted.¹

On this understanding, Marx's frequently ridiculed apothegm is right: the history of all hitherto existing complex societies is the history of class struggles. In fact, this isn't only because class antagonism (struggle) is present in all of them; more importantly, it's because the class structure is the foundation of institutional structures in general, and thus of the framework within which people live and interact. Why can it be called the foundation? Simply because people in the dominant positions of the class structure directly appropriate—necessarily—a sufficient surplus to ensure their continued domination (i.e., to give them the resources with which to continue their domination), and this means they have the resources to ensure that most other institutions and practices are compatible with or subservient to their power. They are the people and groups with the most wealth and resources, and so, obviously, they are better able than others to dictate what forms society and culture will take. This truism is enough to establish the controversial but utterly obvious Marxian metaphor that the economic structure, or class structure, is society's foundation, the “superstructure” (in a loose sense) being politics, culture, and ideology. —In short, the institutions and people with the most resources have the most influence in determining the forms and content of social life.

Class struggle is central to history in still more ways; for instance, virtually by analytical necessity it has been, directly or indirectly, the main cause of most popular resistance and rebellions. Likewise, the ideologies and cultures of the lower classes have been in large measure sublimations of class interest and conflict. Most wars, too, have been undertaken so that rulers (effectively the ruling class) could gain control over resources, which is sort of the class struggle by other means. Wars grow out of class dynamics, and are intended to benefit the rich and powerful. In any case, the very tasks of *survival* in complex societies are structured by class antagonisms, which determine who gets what resources when and in what ways.

—Duh.

From such reflections as these one should already suspect that materialist class analysis will have to be the basis for any explanation of history. Certainly many other factors must come into play, but class is the fundamental one. It gives societies their overall dynamics and provides most of the context for what goes on in them. In fact, it “discloses the real secrets of history: the springs and causes of human behavior and social change.” The best proof of its value as a historical and sociological concept is its fruitfulness; for it has made possible an immense amount of brilliant scholarship since the nineteenth century, which totally eclipses any other school of thought.

Ste. Croix argues that there are two fundamental differences between the ancient world and the modern: first, the former had infinitely more primitive technology. It didn't even have the wheelbarrow! Since it was, therefore, enormously less productive than our own world is, some means had to be found—unless everyone was to have to work practically all the time—to extract the largest possible surplus out of a considerable number of those at the bottom of society. So, in order to have cities and aristocratic leisure and so forth, the propertied classes in Greece and Rome had to derive their surplus not from wage-labor, as in capitalist society, but from unfree labor of various kinds. (Nor was wage-labor plentifully available anyway, or very skilled.) This is the second fundamental difference. The ancient world had debt bondage and a kind of serfdom, as we'll see, but the most important form of unfree labor was slavery—including in agriculture, which is (wrongly) denied by some classicists. It's true that a large part of production was done by small free producers, mainly peasants but also artisans and traders. Nevertheless, Ste. Croix goes so far as to call the Greek and Roman world a slave-owning society or a slave economy, because it was through slavery that the dominant propertied class—landowners—ensured the extraction of the surplus they needed

¹ Tellingly, throughout history dominant classes have had a high degree of class consciousness, usually being much more aware of, and prepared to act on, their unity of interest than exploited classes. Just read the publications of business groups in the U.S. during the last hundred years, and think of their highly coordinated public relations campaigns to secure the population's (passive) consent and extract its money. Something similar was the case over two thousand years ago: Xenophon writes of slaveowners being prepared to act “as unpaid bodyguards of each other against their slaves.” Ironically, then, the “struggle” has typically been more full-fledged and conscious on the side of the oppressors than the oppressed.

for their own leisured existence. *This* is the key point, and it is why Marx said slavery was the foundation of the ancient world even though most production—until the later Roman empire—was done by relatively free peasants and some artisans. Incidentally, these classes too were exploited in various ways, as by taxation, military conscription, or forced services exacted by the state.

In support of his own class-based interpretation of antiquity, Ste. Croix points out that it was substantially shared by Aristotle. (He also inserts a few jabs at Plato, the anti-Aristotle. “The wildly exaggerated respect which has been paid down the ages to Plato’s political thought is partly due to his remarkable *literary* genius and to the anti-democratic instincts of the majority of scholars. Plato was anti-democratic in the highest degree.”) “Like so many other Greeks, Aristotle regarded a man’s economic position as the decisive factor in influencing his behavior in politics, as in other fields.” Evidently he had common sense. He understood that the rich property-owners (landowners) wanted pure oligarchy and the poor extreme democracy; he preferred the middle layers, who because of their moderate amount of property tended to be moderate in opinions and behavior. (Proto-Marxism.) Interestingly, he remarks that in some oligarchical city-states of his day, the oligarchically-minded take the oath, “I will bear ill-will towards the common people, and I will plan against them all the evil I can.” A refreshingly honest oath. Other Greek thinkers, too, understood these categories. Euripides says in one play that there are three kinds of people: “the greedy and useless rich; the covetous poor, easily led astray by scurvy demagogues; and ‘those in the middle,’ who can be the salvation of the city.” Essentially the reason why Aristotle and later thinkers favored a “mixed constitution” in which there is a balance between rich and poor is that this was a way of ensuring a balance in the political class struggle. —Much of what Aristotle says in the *Politics* clearly influenced James Madison and others of our “Founding Fathers,” as shown by the proto-Marxism and Golden Mean-ism of passages in the *Federalist Papers*, as well as in correspondence they wrote to each other.

Not only does Aristotle tend to think in terms of class struggle; he even identifies groups defined according to their role in production, namely working farmers, independent artisans, traders, and wage-laborers. And he understands that city-states’ constitutions will be of different types according to the relative strength of these different elements. No wonder Marx loved him! It’s clear, in any event, that the notion of class is relevant to ancient society and was acknowledged to be so by many thinkers of the time (including even Plato).

Next is a long discussion about why class is not only relevant but more useful than alternative notions like status and “orders” (e.g., citizens, freedmen, the Roman senatorial order, equestrians, and resident foreigners. Orders were very important in the ancient world, as, indeed, in Europe’s Middle Ages). Many criticisms can be given of Max Weber’s emphasis on status as opposed to class—and of his notion of class itself, which is vague and has more to do with market relations and income than relations of production (which are surely what provide the main explanation for people’s market position and income anyway; see Erik Olin Wright)—but Ste. Croix’s main one is that Weberian “status groups” and even “classes” have no *organic relationship* with one another, “and consequently they are not dynamic in character but merely lie side by side, so to speak, like numbers in a row.” Marxian classes are defined by their relations to other classes; the members of a Weberian class or status group have no necessary relationship to the members of another class or status group as such. It’s hard to explain social change on the basis of this static, atomistic and inorganic conception, whereas it’s much easier on the Marxian conception (of irreconcilable interests, antagonistic production relations, and so forth). Of course status groups can be very important to people’s lives and the overall character of a society, and even to some political conflicts;¹ on the whole, though, they’re more useful for *description* than *explanation*. This is one of the reasons for Ste. Croix’s criticisms of the famous classicist Moses Finley, who had less interest in classes than status groups.

¹ But in many such conflicts class interests are very relevant, perhaps in complex ways, even if at first glance they don’t seem to be. They frequently are disguised behind, and help determine, the overt issues. See Marx’s *Eighteenth Brumaire of Louis Bonaparte* and *The Class Struggles in France*.

Ste. Croix's discussion of women is much less satisfactory than the discussion of class vs. status, for he argues that women in antiquity constituted their own social class. Which is absurd. To broaden the concept of production so that it includes biological reproduction is to render it almost meaningless. Nor is an economic surplus necessarily appropriated by men, as such, from women, as such. Sure, the latter are dominated and subordinated, but that is quite different from exploitation in the technical sense. The realm of biology shouldn't be confused with the realm of economic production, to which sex is an external consideration, however much women may occupy particular positions in the relations of production (even sometimes *as women*—but then they're exploited as a result of their location in the economic structure, not directly as a result of having vaginas and ovaries).

Let's get to the non-methodological stuff. The leisured, propertied class (almost entirely landed property)—a tiny minority—of course was differentiated into the more or less wealthy, those who owned more or less property and therefore slaves. Some examples: “the owner of a large or even medium-sized farm, worked by slaves under a slave bailiff, or leased out at a rent; the proprietor of a workshop of, say, 20–50 slaves, supervised by a slave manager; the lessee of mines in the Laurium district of Attica, worked by slaves, and similarly supervised by a manager who would himself be a slave; the owner of a merchant ship or two which he hired out to traders or used for trading himself, manning them with slaves...” Lots of slaves. Though also other kinds of unfree labor, as Ste. Croix emphasizes. Greece was actually rather poor, though, as were its great landowners, compared to Persia and later Rome. The great Roman senators of the empire were astoundingly wealthy; next to them, Greece's aristocrats were petty stuff. The Roman empire, or rather its ruling class, swam in wealth.

As in many later societies, the landed aristocracy sneered at people who had gained their wealth from trade or manufactures. Leisure was the mark of the gentleman. And these value-judgments were to some degree shared by most of the population: “the ideas of a dominant class (at least if it is not a conquering, alien race) are always accepted in some measure by those it exploits, and most of all (as modern experience shows) by those who are near the top level of the exploited and see themselves as about to rise into the ruling class. And most of the words used in Greek to express social qualities and distinctions were heavily loaded with the moral overtones that had always been associated with them [e.g., that being a tradesman was demeaning], so that the poorer Greek would find it hard to avoid expressing himself in the very terms that proclaimed his unworthiness.” The very vocabulary that societies use is inflected with class, partly determined by it.

Slavery and forced labor, serfdom, and debt bondage were widespread in the ancient world, the former three usually resulting from conquest (except in the later Roman empire, when serfdom emerged more organically). Athens was unusual in at least one respect: Solon abolished debt bondage in 594 B.C., a truly radical reform. The ancients themselves divided mankind into only two categories, slave and free, but there were in fact many intermediate statuses. Athens made especially intense use of slavery, despite—but also because of—its democracy. That's ironic, but it was because of democracy that the upper class couldn't exploit the humbler citizens to the degree it could in other places, so it had to rely exceptionally on rights-less slaves.¹ “This [class-based hypothesis] *explains* ‘the advance, hand in hand, of freedom and slavery’ in the Greek world, noted by Finley but left by him as a kind of paradox, entirely without explanation” (because Finley doesn't like to invoke class). Democracy can cause the intensification of slavery, and slavery can help make possible democracy—for some people. Fascinating!

Why weren't there more slave revolts, if there were so many slaves? Mainly because slaves in each city, and often even in single families and farms and workshops, were largely imported “barbarians” and very heterogeneous in character, coming from South Russia, Thrace, Lydia, parts of Asia Minor, Egypt, Sicily, Libya, etc. They didn't have a common language or culture. “The desirability of choosing slaves of different nationalities and languages was well recognized in antiquity, and it is stressed by several Greek and Roman writers as an indispensable means of preventing revolts.” Yes, the old trick of divide-and-

¹ As Ste. Croix says, insofar as democracy gave the poor some power, it “played a vital part in the class struggle by mitigating the exploitation of poorer citizens by richer ones—a fact that seldom receives the emphasis it deserves.”

conquer, used to fantastic effect by modern capitalists when trying to maintain control over their work force. Most techniques of power are timeless.

Serfdom was much less common than slavery in the Greek world: before the late Roman empire there were only isolated *local* forms of it, for instance the Helots of Sparta, and on temple estates in Hellenistic Asia Minor. (This serfdom on sacred land was probably a residue of forms of serfdom that had earlier been widespread in Asia.) “It is essential to realize, however, that these [west Asian] forms of serfdom tended to dissolve as a result of contact with the more advanced Greek and Roman economy (above all, no doubt, when the land came into the ownership or under the control of Greeks or hellenized natives or of Romans), and after a few generations virtually ceased to exist, except as part of very conservative complexes such as temple estates... Until the introduction of the Later Roman colonate, serfdom failed to maintain itself in the Greek world (or in the rest of the Roman empire), and when it disappeared in a particular area, there is no sign that it was re-established.” But in various places, like Ptolemaic Egypt, even some non-serf peasants (who weren’t tied to the land) were subject to very strict controls and supervision. In cases where serfdom disappeared after coming into contact with Greeks and Romans, some of the peasants sank even further, into slavery, whereas in other places they became freer, like if their territory was incorporated into a city.

“It was only at the end of the third century A.D. that legislation began to be introduced, subjecting to forms of legal serfdom the whole working agricultural population of the Graeco-Roman world. In outline, leasehold tenants (*coloni*) became serfs, bound either to their actual farms or plots or to their villages and almost as much subject to their landlords as were slaves to their masters, even though they remained technically *ingenui*, free men rather than slaves; working peasant freeholders too were tied, to their villages.” Later in the book he’ll give explanations for this and other changes from the Archaic Age to the late empire. For now, he’s just describing the whole socioeconomic framework.

As for debt bondage, it is “virtually certain that forms of [it] existed at all times in the great majority of Greek cities.” David Graeber demonstrates the profound significance of debt to the ancient world in his book *Debt: The First 5000 Years* (on which I’ve commented in *Finding Our Compass: Reflections on a World in Crisis*). The consequence of defaulting on a debt in Greek cities might be enslavement or the sale of one’s children. “In Ptolemaic Egypt, there is clear evidence both for outright enslavement for debt and for debt bondage; but in the Roman period the latter seems to have replaced the former. [A rare instance of Roman humanity, perhaps?] It is difficult to generalize about Greek cities, but it does look as if debt bondage largely superseded outright enslavement for debt during the Hellenistic period.” In early Roman law, the position of the defaulting debtor was even worse. “His creditors might keep him in chains; and ultimately...they might cut his body in pieces and divide the parts among themselves.” Lovely. It was clearly a rosy time to live. “The wealthy Roman regarded a defaulting debtor who had been driven to borrow because of dire need, rather than for some speculative or luxurious purpose, almost as a kind of criminal.” What a surprise, this class prejudice against the poor. In general, the Roman state and its law, like all states (to greater or lesser degrees), was “an instrument of the propertied classes; for the propertyless, the state ‘couldn’t care less.’”

Hired labor was less common than both slavery and, surely, debt bondage; its first major appearance in antiquity was in the form of mercenaries, though it was probably common at the peak periods of agricultural activity (harvesting, vintage, olive-picking) and may have been used for public works in Greek cities. Artisans, contractors, shopkeepers, and others must have occasionally hired workers too. The position of these wage-earners was considered contemptible. Plato and Aristotle placed them at the bottom of the social scale, and their attitude was shared by pretty much the whole propertied class. For Aristotle, “there could be no civilized existence for men who did not have leisure, which was a necessary condition (though not of course a sufficient condition) for becoming a good and competent citizen, and indeed was the goal (*telos*) of labor, as peace was of war... The overriding necessity for leisure excludes the citizens of Aristotle’s ideal State from all forms of work, even farming, not to mention craftsmanship... The essential fact which, in Aristotle’s eyes, makes the hired man a less worthy figure than the ordinary artisan is not so much his comparative poverty (for many independent artisans are likely to be poor too) but his ‘slavish’ dependence upon his employer.” This attitude has been shared by many elites throughout history,

for instance eighteenth-century aristocrats like Thomas Jefferson and all his fellow republicans. The propertyless were supposed to be excluded from voting because of their lack of independence and consequent inability to act and think in a properly “disinterested,” public-spirited republican way. They were essentially appendages of their employer. Interestingly, the “labor republicanism” exemplified by the Knights of Labor in the 1880s (in the U.S.) had a similar outlook, considering wage-labor (“wage-slavery”) to be undignified, unmanly, a kind of degradation that interfered with the rights and duties of citizenship. The conclusion they drew, though, as did many other workers before them, was quite different from that of the classical republicans: wage-labor had to be abolished and a cooperative commonwealth established. “There is an inevitable conflict between the wage-system of labor and the republican system of government,” as one of them said. It seems that only in the twentieth century, when the wage-system had finally unequivocally conquered the Western world, was wage-labor, for the first time ever, seen to be necessary and even good, not degrading. An idea that would have been utterly incomprehensible to all previous ruling classes and most of their subordinates.¹

Even Kant, the philosopher who thought of humans as rational animals above all, had the inegalitarian attitude of his contemporaries. As Ste. Croix says, he “wished to confine the franchise to those who were their own masters and had some property to support them. A man who ‘earned his living from others’ could be allowed to qualify as a citizen, in Kant’s eyes, only if he earned it ‘by *selling* that which is his, and not by allowing others to make use of him.’... In a work published four years later Kant returned to this theme...giving four examples of excluded categories which ‘do not possess civil independence,’ such as apprentices, servants, minors and women, who may ‘demand to be treated by all others in accordance with laws of natural freedom and equality’ but should have no right to participate in making the laws.” Such attitudes aren’t *entirely* without merit in the context of the unequal, oppressive, and dependency-producing social structures of his day; but the proper conclusion to draw is that those social structures have to be eliminated, not that the majority of the people shouldn’t participate in civic life.

As I said, public works may have, from time to time, been an important source of employment for unskilled wage-earners, but there isn’t a lot of evidence for this. Contractors (probably hiring general laborers but also using slaves) did most of the work, and they don’t qualify as wage-earners properly so-called. Even in Rome, which must have had the highest concentration of free men, including freedmen, in the whole Graeco-Roman world, there is no evidence for *regular* hired labor of any kind. “A certain proportion of the free poor lived to some extent on handouts provided by wealthy families whose clients they were—thus bringing themselves within ‘the sound section of the populace, attached to the great houses,’ whom Tacitus, in his patronizing way, contrasts favorably with the *plebs sordida*, frequenting (in his picture) the circus and theaters. But the great majority of the *plebs urbana* must have been shopkeepers or traders, skilled craftsmen (or at least semi-skilled artisans), or transport-workers using ox-carts, asses or mules [who weren’t wage-laborers but worked for customers].”

Having discussed *direct individual* exploitation, Ste. Croix turns to *indirect collective* exploitation—as well as the exploitation (mostly of peasants) by landlords and mortgagees that took the form of rent or interest. He mentions that Marx anticipated his distinction between the two kinds of exploitation when he wrote, in *The Class Struggles in France*, of the French peasants of his day that “Their exploitation differs only in *form* from the exploitation of the industrial proletariat. The exploiter is the same: *capital*. The individual capitalists exploit the individual peasants through *mortgages* and *usury*; the capitalist class exploits the peasant class through the *State taxes*.” It occurs to me that the exploitative function of taxes isn’t true only of peasants and the poor in old times; to some extent it applies even to our own day. Insofar as the poor and middle classes don’t get a useful return on their taxes, they’re effectively being exploited. (Surplus is being taken from them without an equivalent being given back: hence, exploitation.) However much of the money they give to the government that goes to paying for wars, interest payments on debt to the rich, corporate welfare, etc. rather than to improvements in public education and

¹ On these topics, see, e.g., Gordon Wood, *The Radicalism of the American Revolution* (New York: A. A. Knopf, 1992); and Alex Gourevitch, “Wage-Slavery and Republican Liberty,” *Jacobin*, February 28, 2013.

transportation, roads, environmental protection (for their children at least), social insurance and so forth amounts to a kind of exploitation. It is indirect, publicly sanctioned, collective exploitation.

Taxation in Greek cities before the Hellenistic period may often have been quite light, “if only because the lack of anything resembling a modern civil service made it difficult if not impossible to collect small sums in taxes profitably from poor people (that is to say, from the great majority of the population), without the intervention of tax farmers, who seem to have been very unpopular with all classes... The total burden of taxation certainly increased in the Hellenistic and Roman periods,” especially in the Later Roman empire, when it fell most heavily on the peasantry, who had least power to resist. As in our own day and throughout history, the rich had a much greater chance of escaping or minimizing payment than the poor.

So, what was the situation of the peasantry? Before delving into it Ste. Croix gives a beautiful tribute to these poor people, the vast majority of humanity in most periods of history, that I can’t help quoting:

To my mind, the most profound and moving representation in art of “the peasant” is Vincent Van Gogh’s *The Potato Eaters*... As Vincent himself said, in a letter to his brother Theo, written while the picture was still being painted, “I have tried to emphasize that those people, eating their potatoes in the lamplight, have dug the earth with those very hands they put in the dish, and so it speaks of *manual labor*, and how they have honestly earned their food. I have wanted to give the impression of a way of life quite different from that of us civilized people.” ...The quality that impresses one most about Van Gogh’s peasants is their endurance, their solidity, like that of the earth from which they draw just sufficient sustenance to maintain life... The Potato Eaters are poor, but they are not evidently miserable: even if the artist shows infinite sympathy with them, he depicts in them no trace of self-pity. These are the voiceless toilers, the great majority—let us not forget it—of the population of the Greek and Roman world, upon whom was built a great civilization that despised them and did all it could to forget them.

The lot of the ancient peasant wasn’t much more pleasant than it’s been at any other time in history. I won’t go into detail, but some indication is given by the fact that, similar to the case in medieval Europe (regarding the protection afforded by exploiting lords), being subject to a landlord could actually be *preferable* to owning land if the landlord could provide protection against the depredations of officials and soldiers—“always a terror to the peasantry in the Roman empire.” Rents were paid in money or in kind, though sometimes in labor services, which were in addition to the irregular services occasionally demanded from tenants. If one wasn’t a tenant but owned land, one may have had to deal with mortgages and foreclosures and so on. And then there were the famines, when it was often only in the *cities* that food was available. (This reminds me of the manufactured famine in the Ukraine in the early 1930s, when Stalin’s Five-Year Plan extracted so much grain out of the countryside that millions of peasants starved. Timothy Snyder has some disturbing descriptions in *Bloodlands: Europe between Hitler and Stalin* (2012).) Landlords in cities sometimes hoarded grain to sell it at high prices, which contributed to starvation in the countryside. Again, there are modern parallels, with respect to European imperialism in India, Africa, and China, which Mike Davis recounts in *Late Victorian Holocausts: El Niño Famines and the Making of the Third World* (2002). Of course these modern semi-manufactured famines were far more horrifying than anything likely to have happened in antiquity.

“The characteristic unit in which peasant life was organized was the village... Many [villages] were situated inside the territory of some city; and some belonged to a handful of absentee landlords, or even entirely to a single proprietor, to whom the villagers paid rent. On the other hand, there were also villages of freehold peasant proprietors... Some villages, at least in Syria and Asia Minor, had what appears to have been a democratic form of organization, headed by a general meeting of the villagers; and—strange as it may seem—it looks as if this democratic form of organization may actually have survived in some villages, in parts of Syria at any rate, after all the genuinely democratic elements had perished from the constitutions of the cities throughout the [Roman] empire.” In the Later Empire these villages were taxed very heavily,

paying their taxes to collectors appointed by the local city. —Peasants, in short, were largely at the mercy of the powerful, who could regularly act with virtual impunity.

At this point in the book Ste. Croix shifts to discussing the change in the *forms of exploitation* that happened slowly during the first three centuries A.D. A very important topic, which explains the eventual enslavement of most of the free working agricultural population of the Roman empire. The change happened all over the Graeco-Roman world but in varying degrees and at very different speeds in different areas. It has to do with the fate of slavery. In the late Roman Republic a series of foreign wars and civil wars had provided an abundant supply of cheap slaves for Mediterranean slave markets, but from the Augustan Principate (beginning in 30 B.C.) onwards there was a period of relative peace. As a result, “the number of slaves that were simply *appropriated from outside the Graeco-Roman economy, or brought within it by purchase*, soon began to decline.” (His italics.) To keep replenishing the slave population, therefore, it was necessary to encourage one’s slaves to breed. This hadn’t been done very much before because it tended to *lower the rate at which they could be exploited*, since the female slaves bearing children would of course be occupied, for a time, with things other than work, and would often even die in childbirth. As for the children, the many who didn’t live to an age at which they could give a good day’s work would be a dead loss to the master. For other reasons too, masters had preferred simply to buy new slaves coming in from foreign wars and discourage their breeding. But with fewer such imported slaves during the Principate (and the greater cost of those who were imported), slaveowners now resorted to breeding them, which had momentous consequences for the economy: in brief, it imposed a greater burden on the economy, because of the *lower rate of profit from slave labor*. This, in turn, would be likely to cause the propertied class to *increase the rate of exploitation of the humbler free population*—as the Roman ruling class now did, by degrees.

Hitherto slaves had frequently been housed in sex-segregated barracks, but now, to encourage them to breed, it was desirable to establish them in conditions conducive to the rearing of families (which itself made it harder to exploit them). It’s not surprising, therefore, that as early as the last century B.C. we find evidence of slaves settled as virtual tenants of agricultural plots, with their own families. They were still technically slaves, but from the economic point of view they were tenants and could even own slaves of their own. Gradually slavery declined in such ways as these. Leasing lands as opposed to managing them oneself (overseeing one’s slaves, etc.) became more common, in part because large landowners after the Republic were more likely to own widely diffused plots of land all of which they could hardly manage themselves. But even if they didn’t own so many plots, it was still easier and less time-consuming simply to lease land to tenants (sometimes thousands of them) who would do the necessary productive work. These tenants were most often *coloni*, tied down by debts to their landlords, such as rent in arrear that gave an excuse for the landlord to make the conditions under which the tenant used his land more burdensome (which the tenant would still find preferable to being hauled off to debtor’s prison). So, on the whole, the condition of slaves gradually improved somewhat and that of peasants throughout much of the Roman empire declined (at different rates). Finally towards the end of the third century A.D., “as part of the great reform of the system of regular taxation introduced by Diocletian,” these agricultural workers became *legally* bound to the soil. In fact, not only leasehold tenants but virtually *the whole of the agricultural population* in the Roman empire was tied to the land on a hereditary basis and thus entered into serfdom (or quasi-serfdom in the case of peasant freeholders, who were tied not to a particular farm or plot but to their village). The reason for these legal changes was to facilitate the increased exploitation of the peasantry, primarily through taxation but also forced services and military conscription.

This legal reorganization “was of course seen by its authors as necessary, in the common interest of all, for the very preservation of the empire, imperiled as it was now, as never before, by ‘barbarian’ threats, by the increased power of Persia under the Sassanids, and by internally destructive rivalries for control of the imperial power. However, the propertied classes were determined to maintain, and were able to maintain, their dominance and their economically privileged situation... The great reorganization was therefore primarily for the benefit of the propertied classes as a whole; and for them, or at any rate their upper crust, it worked wonders for a time.” He’ll return to these topics later in the book, when he discusses the decline of the Empire.

As all this was going on, barbarians were settling the empire to an enormous extent, a fact that from a *cultural* point of view may have contributed to the decline of Rome but from an *economic* point of view must have helped preserve it for a while. Those who were brought in after capture by or surrender to Roman generals probably became mere tenants or *coloni* (often of imperial estates), whereas most who entered the empire by voluntary compact got to own their own land. The beneficial economic effect of these barbarian settlements “becomes immediately obvious when we realize that all those in which the settlers became mere tenants, and (if to a less extent) the majority of those involving freeholders, provided *both recruits for the army and an adult workforce, the cost of producing which had not fallen upon the Graeco-Roman economy.*” The barbarian settlers therefore helped compensate for the lower profits from slavery.

Despite the decline of slavery, it’s necessary to emphasize “the universal and unquestioning acceptance of slavery as part of the natural order of things, which during the Principate still pervaded the whole of Greek and Roman society—and of course continued in the Christian empire just as in earlier times. Slavery continued to play a central role in the psychology of the propertied class. [As Marx said, ideologies tend to linger long after the social conditions that birthed them have evolved to new ones.] And here I would refer again to what I said earlier about debt bondage: every humble free man must always have been haunted by fear of the coercion, amounting to slavery in all but name, to which he might be subjected if he ever defaulted on a debt to a rich man—including the payment of rent, of course.”

Ste. Croix’s comments on “the military factor” in the Roman empire are worth quoting, at least some of them. Needless to say, military considerations were highly relevant to Rome’s downfall. Here are a few salient points:

1. From the second quarter of the third century onwards pressure on the frontiers of the Roman empire became much greater and tended to go on increasing, and the defense of the frontiers therefore became a matter on which the empire’s survival rested.
2. In the circumstances of the time, the necessary standing army had to be raised largely from the peasantry.
3. In order to provide sufficient recruits of strong physique and potentially good morale, it was therefore essential to maintain a reasonably prosperous and vigorous peasantry.
4. On the contrary, as land, during the early centuries of the Christian era, became increasingly concentrated in the hands of a few owners (throughout most of the West and also, to a less extent, over a large part of the Greek East), the condition of a substantial proportion of the agricultural population became more and more depressed, until before the end of the third century most working peasants were subjected to forms of serfdom or quasi-serfdom...
5. *Socially* and *militarily*, this process was very harmful, since the peasants became increasingly indifferent towards the maintenance of the whole imperial system, most of the burden of which fell heavily upon them; and the morale (and probably the physique) of the army deteriorated, with the result that much of the empire disintegrated by stages between the early fifth century and the mid-seventh.
6. The maintenance of a relatively prosperous peasantry, sufficiently numerous to provide the large number of recruits needed for the army and willing to fight to the death in defense of their way of life (as the free Greeks and the early Romans had been), might have made all the difference and might have preserved the unity of the empire very much longer.

As he says, “the attitude of the peasantry in both Eastern and Western parts of the Roman world during the Later Empire was extraordinarily passive and indifferent.” Sometimes peasants even joined the barbarian invaders. Karma, Rome.

We’ll return to the fall of Rome later on, at the end of the book.

Now for Part 2, which is less descriptive and more explanatory. He begins with “the age of the tyrants” in Greece, between the mid-seventh century B.C. and the late sixth. Many Greek cities, which had been dominated until then by hereditary aristocracies, experienced a new form of personal dictatorial rule, by the so-called tyrants. “When the rule of the Greek tyrants ended, as it usually did after quite a short

period, of a generation or two, hereditary aristocratic dominance had disappeared, except in a few places, and had been succeeded by a much more ‘open’ society: political power no longer rested on descent, on blue blood, but was mainly dependent on the possession of property (this now became the standard form of Greek oligarchy), and in many cities, such as Athens, it was later extended in theory to all citizens, in a democracy.” A fundamental change, which isn’t hard to explain in terms of class struggle. The classes at issue were, on the one side, the hereditary ruling aristocrats, who were mainly the principal landowners and entirely monopolized political power; on the other side, at first, everyone else, the “demos.” Some of the latter were quite prosperous, but more common were the well-to-do and middling peasants, who are often called “the hoplite class” because they provided the heavy-armed infantry of the Greek citizen armies. They owned a moderate amount of property. Below them were poor peasants, artisans, shopkeepers, petty traders, and wage-laborers.

What happened, then, is typically that the demos or some section of it revolted against oppression and exploitation. At some point a capable leader emerged who seized the semi-crisis for his own benefit, and after whom the old secure days of aristocracy were over. Solon and Peisistratus were *good* examples of tyrants, in Athens. A considerable proportion of the hoplite class must have given support to the tyrants, but they also came to power by means of mercenary forces or outside intervention (e.g., by Persia or some other Greek city-state). —Once again, Aristotle understands the significance of the class struggle. He contrasts traditional kingship with tyranny: the former “came into existence for the purpose of helping the better classes against the demos,” whereas tyrants arose “from among the common people and the masses, in opposition to the notables, so that the demos should not suffer injustice at their hands... The great majority of the tyrants began as demagogues, so to speak, and won confidence by calumniating the notables.” Good old-fashioned materialist common sense, depressingly opposed to the current postmodern obsession among historians with “complicating old narratives” etc., an obsession they’re too obtuse to realize is nothing but an aid and comfort to the ruling class and is so widespread just because it can get through institutional filters by distracting from class struggle. If intellectuals are successful, it’s because they don’t challenge the powerful. (There are always a few exceptions, like Howard Zinn—people who bypass the approved channels and speak directly to the public.)

After the tyrants came the great age of Greek democracy in the fifth and fourth centuries B.C. Ste. Croix actually says that so-called tyranny was a necessary phase in the development of many Greek states, because “institutions suited to maintaining in power even a non-hereditary ruling class, let alone a democracy, did not exist (they had never existed) and had to be created, painfully and by experience, over the years”—and so in this sense “tyranny” helped pave the way for democracy, a new phenomenon on the world stage (at least among thoroughly civilized societies). Democracy came to exist in scores of city-states, not only Athens; it involved majority vote of all male citizens, even the propertyless—an extraordinary fact. Recall that even in the U.S. it took until the mid-nineteenth century for such democracy to be well established. “The great aim of democrats was that their society should achieve as much freedom (*eleutheria*) as possible... Since public debate was an essential part of the democratic process, an important ingredient in democratic *eleutheria* was freedom of speech.” Of course there was also equality before the law.

As in modern times, democracy was born through struggle on the part of the unpropertied or less propertied. For centuries, “economic distress often drove the impoverished to attempt revolution, with the aim both of capturing control of the state and of effecting some kind of reallocation of property—most frequently in the form of a redistribution of land or the cancellation of debts.” The propertied, too, were wont to attempt revolution, on the side of oligarchy. These “revolutions” were most likely to be successful when an outside power was called in by the revolutionaries, such as Athens (to help install democracy) or Sparta (to install oligarchy).¹ It seems, incidentally, that Athens in the fifth century was possibly the only example in history of an imperial power that sought to create or strengthen *democracy* in the areas it dominated, and allied not with the upper class but the middle and lower. Athens suffered from less overt

¹ “In the early fourth century, Xenophon in particular always takes it for granted that when there is a division within a city on class lines, the rich will naturally turn to Sparta, the demos to Athens.”

class warfare in this period than many other *poleis* did because of its stable and secure democracy; but you can see how bitterly the rich resented democracy and its leaders (whom they often called “demagogues”) in the writings of Plato, Isocrates, Xenophon, and others.

“In the political sphere, democracy barely held its own in the fourth century [B.C.], and in many cities outside Athens the class warfare which had already become widespread in the last quarter of the fifth century became more acute... Oligarchic and democratic leaders had no hesitation in calling on outside powers to help them gain the upper hand over their adversaries.” That’s incredible: the fiercely independent Greeks were willing to subordinate their independence to class advantage! Violent civil strife sometimes broke out between the classes. Tyranny, which had become rare, began to occur again, suggesting an intensification of class strife. “Rich and poor would regard each other with bitter hatred, and when a revolution succeeded there would be wholesale executions and banishments, and confiscation of the property of at least the leaders of the opposite party.” Many among the propertied classes wanted there to be a Greek crusade against Persia, since they thought this might provide land and a new hope for people who could no longer make a living at home. –This reminds me of what U.S. historians like Frederick Jackson Turner have argued: the vast, relatively empty Western lands in nineteenth-century America alleviated class tensions in the East, by drawing away millions of potentially discontented immigrants and giving them new opportunities. Apparently the same useful function of land was recognized in ancient Greece. (And think of the Nazi obsession with *Lebensraum*. Again, it could lessen class conflict: one shouldn’t have oppressed and oppressors packed together too tightly.)

By the time of Philip II of Macedon, Alexander the Great’s father, the oligarchically minded all over Greece gave (treasonous) support to his conquest of their cities, because they understood he would be much more sympathetic to oligarchy than democracy. And indeed, the League of Corinth that he and Alexander organized prohibited redistribution of land, the cancellation of debts, the confiscation of property, and the altering of city constitutions. (America’s Founding Fathers, likewise, did what they could to prevent their elitist and rich-coddling Constitution from being altered, by making the process of amendment extremely cumbersome.)

So, the Hellenistic era. And then the suzerainty of Rome. In the early Hellenistic period the lower classes (especially among the city-dwellers, less so the peasants) may still have played an important part in the life of their *polis*, but very soon “there developed all over the Greek world a tendency for political power to become entirely concentrated in the hands of the propertied class. This development, or rather retrogression, was still by no means complete when the Romans took over, in the second century B.C. The Romans, whose governing class always detested democracy, intensified and accelerated the process; and by the third century of the Christian era the last remnants of the original democratic institutions of the Greek *poleis* had mostly ceased to exist for all practical purposes.” Athenian democracy was effectively destroyed by the Macedonian Antipater in 322/1 B.C. after Athens had risen up against Macedon’s rule and been defeated. The next fifty years were full of oligarchies, uprisings, blockades, and constitutional changes; after further vicissitudes the Roman general Sulla sacked Athens in 86 B.C., against “heroic and futile resistance” by the demos. In general, though, the Romans and the Hellenistic kings didn’t treat the Greek cities they dominated in an overly oppressive manner. The kings, at least, rarely even formally limited political power to a small class, feeling obliged to support democracy because it was so well established by tradition.

Nevertheless, after the fourth century B.C. there were several common oligarchic methods of subverting democracy. The first entailed control of the city Assembly by royal officials, magistrates, and the like. Another, from a more long-term perspective, was the gradual abolition of the popular courts (like the one that convicted Socrates), on which in a full Greek democracy all citizens were entitled to serve. The Romans sometimes made constitutional changes to limit democracy, but more often simply supported the local rich and encouraged them to take control of political life. As they were only too happy to do. As usual, therefore, it was the rich who were most inclined to be traitors or semi-quislings, or to cooperate in the subordination of their land to an overlord, because that was a way to protect their property and power.

Ste. Croix anticipates a later discussion when he says, “The most significant result of the destruction of Greek democracy was the complete disappearance of the limited measure of political protection afforded

to the lower class against exploitation by the propertied, which became intensified in the early centuries of the Christian era and was one of the prime causes of the disintegration of a large part of the Roman empire between the fifth and seventh centuries.” He also remarks that “modern historians [characteristically] have shown little concern with this aspect of the disappearance of democracy; and when they have noticed the disappearance at all, their interest in it has usually been submerged by attention to the supersession of ‘city-state’ or ‘republican’ forms of government (which of course may be either democratic or oligarchic) by the monarchy of the Hellenistic kingdoms or of the Roman Principate.” *Political forms* matter more to most historians and other academics than *social content*. Doubtless it takes a little digging to unearth the class content behind political and social forms, but such content is, after all, the most important thing, which largely explains the rest.

Likewise, when reading primary sources, you should always keep in mind the class background, agenda, and prejudices of the author(s). When Cicero and other ancient thinkers praise republicanism and so forth, or exhort jurists in a court of law to heed “the welfare of the state, the safety of the community, and the immediate interests of the Republic,” you should know that by “republic” they mean the propertied few. Class is the prism through which they, and all of us, view the world, because it (i.e., access to resources, and to particular types of resources) predominantly shapes our experiences and judgments and aspirations.

The lower classes resisted the slow crushing of democracy, though in the long run without success. Demonstrations were organized in hippodromes or amphitheaters, sometimes in the presence of the Roman emperor; as a consequence of such activities, the imperial government was very leery of allowing any sort of combination or association among the lower orders in the Greek East. Not even fire-brigades or mutual benefit societies were always accepted, because their activities might become political. There were also riots, involving the lynching of some detested official or the destruction of a local magnate’s house for some cause like his refusing to distribute grain during a famine. —Thus does the ruling class reap what it sows.

The book isn’t focused on Rome as such but only insofar as it participated in the Greek cultural and linguistic world. Even so, Ste. Croix devotes a chapter to Rome for its own sake, so to speak. It begins with an illuminating discussion of the much-vaunted Roman genius for law, which turns out only to have been for civil law, not criminal or constitutional law. It certainly wasn’t a society “ruled by law”; even in the Principate (established by Augustus), not to mention the later Dominate, it was ruled much more by arbitrary power and discrimination on the grounds of social status and class. But its extraordinarily detailed civil law did hold property rights to be sacrosanct—which explains why Roman law was rediscovered and revived during Europe’s late-medieval transition to capitalism. Human rights are meaningless to capital, indeed a positive hindrance, while property rights are the be-all and end-all. Another interesting (though predictable) relation to the present is that the Romans shared the penchant of the U.S.’s rulers—and the rulers of every other imperial power in history—to justify their war-making in terms of *defense*. According to Cicero—“in whom we often find the choicest expression of any kind of Roman hypocrisy”—it was only by “defending their allies” that the Romans became “masters of all lands.” In fact, as one historian has said, “the peculiar Roman conception of defensive war...covered the prevention and elimination of any *potential* menace to Roman power.” Hm, reminds me of the Bush II administration’s doctrine of preventive war, to justify invading and destroying Iraq. —There are only a few ideological tricks in the bag of the oppressors, so they have to keep reusing the same ones from time immemorial. (Whatever one may say about Bush and his cronies, *original* they were not.)

The Roman Republic was just as riven by class conflict as the Empire and the Greek *poleis*. In part, it took the form of conflict between Patricians and Plebeians, dating from the Republic’s very beginning in 508 B.C. These terms denoted orders, not classes, but, as always, there was a close relation between status and class. Truistically, “the Patricians were able to gain access to, and ultimately to monopolize, political power at Rome *because* they were by and large the *richest* families—in the mainly agrarian society of early Rome, the *largest landowners* above all.” There are always exceptions here and there, but the generalization is broadly true. The Plebeians were more heterogeneous, some of them even rich, but their goals were typically to lessen both political oppression and economic exploitation (as we would call it today). In 494

they were able to create the institution of the *tribune* to advocate for them. I won't go into detail, since the history is easily accessible in popular books. The main point is that, in the long run, the "conflict of the orders" succeeded only in replacing the patrician oligarchy by a patricio-plebeian oligarchy that differed very little from the previous one in outlook and behavior. The governing class was thus broadened somewhat, as often happens in history—the social and economic discontent of the excluded masses gets suppressed while the richest among them are granted entry into the ruling elite¹—and the influential position of its members came to be based even more on wealth rather than their status as patricians. It's clear, in any case, that Rome was never anything like a democracy.

As you know, the Republic succumbed to civil wars and Julius Caesar and finally the Empire. How can all this be explained? Ste. Croix starts by mentioning the *populares*, like the Gracchi, Catiline, Cadius, and Caesar, who were opposed by the *optimates*, like Cicero. The latter, of course, favored oligarchy and didn't want concessions made to the "starving, contemptible rabble," the "dregs of the city," the "indigent and unwashed," the "dirt and filth" (as Cicero said). The former, while not really democrats, took a more populist stance, advocating debt relief, distribution of grain to the poor, agrarian reform, and defense of democratic elements in the constitution. "The *populares*, then, served as leaders of what was in a very real

¹ Think of the modern European "bourgeois revolutions." They didn't immediately do much to end the oppression of workers and peasants, but they did succeed in extending political representation to the hitherto excluded bourgeoisie. I recall a passage from a paper I wrote on the Russian Revolution: "The duality between the [worker-oriented] Petrograd Soviet and the [bourgeois-oriented] Provisional Government [between February and October 1917] points up the tension in every anti-'ancien régime' revolution between, on the one hand, the impoverished and semi-impoverished masses, including (certain sections of) the peasantry, the petty-bourgeoisie and the workers, and, on the other hand, the bourgeoisie or the 'respectable classes' who are striving for representation in the autocratic government. The latter groups tend to desire only political and legal reforms in the mold of liberalism, while the former desire something like a social revolution, including universal suffrage, radical democratization, and social equality. For example, in *The World Turned Upside Down* (1984), Christopher Hill notes with regard to the English civil wars of the mid-seventeenth century that *two* revolutions occurred: 'The one which succeeded established the sacred rights of property (abolition of feudal tenures, no arbitrary taxation), gave political power to the propertied (sovereignty of Parliament and common law, abolition of prerogative courts), and removed all impediments to the triumph of the ideology of the men of property—the protestant ethic. There was, however, another revolution which never happened, though from time to time it threatened. This might have established communal property, a far wider democracy in political and legal institutions, might have disestablished the state church and rejected the protestant ethic.' The Levellers, the Seekers, the Ranters, the Diggers, and other such radical groups represented the revolution that might have happened. Similarly, in revolutionary France a tension continually displayed itself between radical democracy and 'responsible' representative government. The same conflict flared up in 1848, when the French workers and bourgeoisie fought together against the monarchy—although, more accurately, it's always the workers (and petty-bourgeois) who do the actual fighting—only to part months later, when the bourgeoisie allied itself with the aristocracy in crushing a threatened popular revolution. A similar phenomenon was evident in Russia in 1905, with the workers fighting alongside the bourgeoisie though each distrusted the other. And in 1917, first the bourgeois revolution—exemplified by the establishment of the Provisional Government—triumphed, and then the popular revolution did, exemplified by the events of Red October, which were supposed by millions to have finally established the principle of soviet democracy. [They didn't; the Bolsheviks turned out to be just another elite that suppressed economic democracy, this time in the name of 'socialism.' Stalinism was the long-term consequence.] Generalizing, it's evident that in some cases the popular revolution fails, which may result in a narrow parliamentary government, limited suffrage, and a liberal social order conducive to the development of capitalism, while in other cases (e.g., Russia in late 1917, China in 1949, and perhaps certain Latin American countries for a few years before the return of capital-based authoritarianism), the popular revolution 'succeeds'—at least it appears to, temporarily—resulting in the suppression of landowners and capitalists. In 1917, the masses had the resources, the numbers, the circumstances, and the (ultimately traitorous) leaders to succeed, whereas in France in the 1790s they didn't (because industrialization had not yet begun, urbanization was in its infancy, etc.)." See, among many others, Christopher Read, *From Tsar to Soviets: The Russian People and Their Revolution, 1917–21* (New York: Oxford University Press, 1996); Orlando Figes, *A People's Tragedy: A History of the Russian Revolution* (New York: Viking, 1996); and Roy Medvedev, *The October Revolution* (New York: Columbia University Press, 1979).

sense a political class struggle: a blind, spasmodic, uninformed, often misdirected and always easily confused movement, but a movement with deep roots, proceeding from men whose interests were fundamentally opposed to those of the ruling oligarchy..." Also relevant to the class struggle and civil wars was the fact that Rome was a great imperial power. Enormous wealth flowed to Rome's elite as a result of its rapacity and plundering abroad. As with modern imperialism,¹ the majority of the population received little direct benefit from the conquests, and in some cases was harmed. As one historian says, in the Late Republic the senators and equestrians—i.e., the nobility—who profited from the empire

did not use their newly acquired wealth for any economically productive purpose; they spent it either on luxury goods or on the acquisition of land. Their demand for luxuries encouraged a one-way traffic of imports into Italy, which provided employment for provincial craftsmen and profits to merchants both provincial and Italian. Their acquisition of land led to the pauperization of many of the Italian peasantry. The Italian lower classes lost rather than gained by the empire. Many of them lost their land and were recompensed only by cheap corn if they migrated to Rome, or meager pay in the army.

Much of the Italian peasantry in this era was impoverished by military conscription, which took them away from their productive activities; at the same time, the rich were getting richer and dispossessing the poor from their land. Discharged veterans had little or no property to support them when they returned home. Being as short-sighted as the oligarchs of the twenty-first century—who are only destroying their power in the long run by increasing it in the short run—the senatorial government refused to give even the poorer legionaries land. "Consequently the loyalty of discharged veterans, and of soldiers who knew they would otherwise be left without means on discharge, was deeply engaged to commanders [like Marius and, later, Caesar] who could be relied upon, in the teeth of senatorial opposition, to make land grants available to their veterans... This gave the commanders irresistible strength." (It was Augustus who finally prepared the ground for a permanent standing army; and he and Tiberius ended conscription, though it returned later.) What happened, then, were the civil wars, between generals each with his own private army. Octavian—Augustus—was the final victor.

This is the kind of thing that happens when the rich get too rich and are given too much license to do as they want. They dismantle or ignore rules that aren't in their short-term interest, which inevitably causes a gradual disintegration of social bonds, of any kind of social compact, public-spiritedness, and the very fabric of society. Privatization destroys public goods, thus ultimately destroying society itself. Class polarization increases, and with it social discontent and instability, which creates opportunities (in certain historical contexts) for political and military adventurers. This is especially the case if savage imperialist practices have inured soldiers and commanders (and politicians, etc.) to war, such that they may visit war upon their own society. A gifted military commander or politician may emerge to break the stalemate, the polarization, between the classes and partially rescue society from its dysfunction; Gramsci's "Caesarism," as with Caesar himself or Augustus or Mussolini or Hitler, can step into the breach and cut the Gordian knot (to mix metaphors) by means of violence or terror and dictatorship. The propertied class remains on top, but concessions are given to the masses for the sake of preserving the social and economic order. What's amazing, with respect to Rome, is how durable Octavian's Caesarist intervention was, enabling Rome to last several centuries longer! The man was obviously a political genius.

Machiavelli describes an important aspect of the emperor's role well. As Ste. Croix says, "Augustus and many of his successors would have applauded the fascinating passage from the *Discourses on the First Decade of Livy*, in which Machiavelli recognizes the necessity, in a state containing over-powerful *gentiluomini* of the kind he so detested (bearing a striking resemblance to the Roman landed aristocracy), for a monarch with 'absolute and overwhelming power,' to restrain the excesses of 'the powerful.'" The essential role of the emperor, like that of modern presidents and prime ministers, was "the reinforcement of the whole social and political system and making it a stronger and more efficient instrument for the

¹ J. A. Hobson's *Imperialism* (1905) gives a good analysis, much of which applies to our own day.

exploitation of the great majority,” a role that necessitated regulation and reining-in of the upper class’s savage instincts. In the Later Empire, when barbarian incursions became more frequent, the emperor had to step up the exploitation and extract more taxes by making serfdom *de jure*, not only *de facto*. This also, combined with the regime’s life-and-death situation, necessitated the emperor’s assumption of even more autocratic power than before (though still to some extent disguised by the legal fictions and institutionalized tactfulness of which Augustus had set the precedent, to avoid offending the Senate).

Ste. Croix’s chapter on “the class struggle on the ideological plane” has some interesting passages, although, because it deals with mere ideology, it’s less fruitful than the other chapters. It starts out with a consideration of the very great importance of sheer terror and violence in keeping the propertied in power—tactics that the Romans perfected. The Greeks were more humane, doubtless in part because they didn’t have a vast empire to control. More interesting are the intellectual and ideological tricks that the ancients—and all ruling classes—(have) used to justify oligarchy (usually without admitting to themselves that what they’re justifying is oligarchy). Probably the most universal one, from antiquity up to the twentieth century and our own day, is the Platonic argument that only those people intellectually qualified and trained for ruling should have power; others, while doubtless performing essential social and economic functions, should stick to their (subordinate) calling, so to speak, and not irresponsibly interfere with governance. As Noam Chomsky likes to remind us, this ideology was shared by liberal intellectuals like Walter Lippmann and Edward Bernays, who helped found the public-relations industry (a euphemism for the propaganda industry, as it was more honestly called in the early twentieth century). “The bewildered herd” should stay out of the way and consent to being governed by “a specialized class whose interests reach beyond the locality” (Lippmann). These ideas aren’t always articulated, because they don’t sound very democratic, but of course nearly everyone who participates in governing believes them. Their plausibility is another question entirely, which at least partly has to be answered in the negative. Certainly some training is required to govern, in some cases some specialized knowledge, etc.; but when you reflect on how well and “disinterestedly” the powerful in history have carried out their “sacred obligations,” you begin to doubt the soundness of the argument. If anything, the powerful have usually been more self-interested and short-sighted than their subjects, who, when they get the chance—as with the contemporary movement called “participatory budgeting”—regularly determine the proper priorities of government far more effectively than the rich and/or powerful do.

The Greek notion of *natural slavery* wouldn’t be accepted by most of the elite now, at least not without modification, but it isn’t far from the Social Darwinism that the rich love. It’s hard to imagine many of the privileged not agreeing with Plato that “those who wallow in great ignorance and baseness” *belong* as slaves, or rather as the lower classes. (Ironic that the great ignorance and baseness has usually been on the side of those who call others ignorant and base.) “Some people are born weak,” etc. Class privilege manufactures such ways of thinking, because people are born to rationalize. While the idea of natural slavery wasn’t widely accepted for very long, slavery itself was rarely questioned in antiquity—at least according to surviving records. Even Christians didn’t question it, with a few marginal exceptions. (As always, an ideology is adapted to material realities. It would have been odd if most Christians had questioned such fundamental institutions as slavery and serfdom.)

Nor were the ancients (at least the “respectable” ones whose writings survive) prone to questioning the rights of property. “It is property that confers rank,” Ovid said. The Elder Seneca said, “It is property that raises to the rank of senator, property that differentiates the Roman *eques* from the plebs, property that brings promotion in the army, property that provides the qualification for judges in the forum.” Cicero thought the primary function of a state was to protect private property rights. And there are other examples. The Jews were different, because of their different socioeconomic context (the provinces, the countryside)—and for Jesus it was a positive evil to have a lot of property, which could prevent someone from getting into heaven—but such radical ideas were partially cast off as Christianity migrated from the *chora*, the countryside, to the *polis*, the Graeco-Roman city. Later, it was only among the heretical Christian thinkers that private property was condemned. I’ll copy here some thoughts Ste. Croix inserts after his long discussion of early Christians’ obsessive persecution of each other, because the points he makes are good Marxist ones:

I doubt if a better means could have been devised of distracting the victims of the class struggle from thinking about their own grievances and possible ways of remedying them than representing to them, as their ecclesiastical leaders, did, that religious issues were infinitely more important than social, economic or political ones, and that it was heretics and schismatics (not to mention pagans, Manichees, Jews, and other “lesser breeds without the Law”) upon whom their resentment could most profitably be concentrated... [They were taught that] their real enemies were those enemies of God and his Church who, if they were not suppressed, would endanger men’s immortal souls and bring them to perdition. “Heretics” and “schismatics,” as well as “unbelievers,” were an entirely new kind of internal enemy, invented by Christianity, upon whom the wrath of “right-thinking people” could be concentrated, for in paganism the phenomena of “heresy” and “schism,” as well as “unbelief,” were inconceivable: there was no “correct” dogma in which it was necessary to believe in order to avoid anathema in this world and damnation in the next, and to secure eternal life; and there was nothing remotely resembling a single, universal Church. We may reflect by contrast upon the good fortune of the mass of Greeks in the Classical period, who had no such beliefs instilled into them, to prevent them from recognizing who their real internal enemies were, and to persuade them that democracy was a useless if not an impious aim, since “the powers that be are ordained of God” [as St. Paul said].

You see here how this sort of dogmatic religion was, perhaps, the first ideology to fulfill a function like that of nationalism, fascism, and Nazism later: it distracted from real issues, fabricated pretend internal and external enemies, and was therefore ultimately embraced by power-structures. *Always* the masses must be divided in order to be conquered.

Okay, now for the final chapter in the history: the decline and fall of Rome. Ste. Croix begins with the gradual whittling away of the legal rights of the poorer classes, from the first century A.D. to the third. In 212 Roman citizenship was extended to nearly all the free inhabitants of the empire, but this meant very little; it was probably mainly an excuse to tax them more. Citizenship had come to mean less and less as a new set of social and juridical distinctions had arisen that were more important; and these distinctions were, on the whole, class distinctions. “For all practical purposes the constitutional rights to which an inhabitant of the Graeco-Roman world was entitled by at any rate the early third century depended hardly at all upon whether he was a Roman citizen, but, broadly speaking, on whether he was a member of what I shall call ‘the privileged groups’: namely, senatorial, equestrian and curial families,¹ veterans and their children, and (for some purposes) serving soldiers.” The people below the privileged groups were the lower classes, who possessed little or no property; and, except for veterans and soldiers, who were of unique importance to the empire (its ruling class) and so were worth protecting, the privileged groups had by the third century become almost identical with the propertied class, i.e., those who could live in relative leisure off the proceeds of their property.

There were several differences between the two groups. For one thing, according to the “dual penalty system” the privileged received lighter punishments, for example decapitation instead of crucifixion, burning to death, or the beasts. They were exempt from flogging and from torture (which was frequently used in court), and it was easier for them to avoid imprisonment pending trial. Evidence given in court by members of the lower classes was accorded less weight than that of their social superiors. And so on. These kinds of inequalities are of course almost universal in history, and very much present in our own society. (Higher rates of incarceration of black males for nonviolent crimes than white males, etc.) More pertinently, the legal differences mentioned show it was becoming easier to exploit the humbler free people than it had been in the past—and, again, exploiting them was also more necessary, because the elite was becoming more directly dependent for its surplus on the free or quasi-free people than the (diminishing number of) slaves.

¹ The curial order consisted of the members of the city Councils and their families, who eventually became a hereditary local governing class.

It was expedient to develop these new, largely class-determined distinctions because Roman citizenship, on which earlier privileges had been based, had, by its gradual extension, long ceased to be a class-specific thing.

The fiscal burdens of the Roman state began to get severe in the reign of Marcus Aurelius, between 161 and 180 A.D., because of ever more barbarian irruptions and the necessity to defend Rome. It was around this time that financial pressures on the curial order—to which belonged smaller landowners than senators—began to ruin some of its lower members. Public services of all kinds were demanded of them, which they couldn't afford. Their decline is shown by the fact that in the late fourth century the emperors even made it permissible to flog them mercilessly, sometimes to death. The richer ones might be able to finagle their way into the senatorial ranks—in part to avoid these dreaded floggings—but the situation of the poorer ones deteriorated. Exploitation and the class struggle thus worked its way up into the elite itself, and started to polarize it. Eventually the *curiales* “were reduced to little more than minor local officials responsible for tax-collection and the performance of other public duties,” with very little real power.

“The whole process brings out admirably the complete control exercised over the whole Graeco-Roman world by the very highest class, of senators and equestrians—who had merged into a single order by at least the beginning of the fifth century. There were now more grades within the senatorial order... The utter lack of any kind of real power below the highest class left even men of some property and local distinction helpless subjects of the great... The screw, having already been tightened at the bottom of the social scale by landlords and tax-collectors about as far as it would safely go, and indeed further, had from the later second century onwards (as the situation of the empire became less favorable), and regularly during the third, to be put on the curial class, as the only alternative to the increased taxation of the really rich, which they would never have endured.” More and more polarization as the top tenth of one percent gets ever richer. —Wait, that sounds familiar...¹

Edward Gibbon called the process of disintegration of the Roman empire “the greatest, perhaps, and most awful scene in the history of mankind.” He was wrong—that distinction surely belongs to the transport of millions of Africans to the Americas, as W. E. B. DuBois thought—but the opinion is understandable. (The collapse of Rome, however, will seem as nothing compared to the collapse of the present world-system in the coming century or two.) The tearing apart of first the Western Empire and then the Eastern, by the Arabs and many others, coincided with an intensification of horrors by the Roman overlords, including the much more frequent use of torture and mutilation, not to mention extortionate taxation of the lower classes. Corruption was rampant; poor men accused of crimes rotted in Roman prisons for months even before the trial happened. (Luckily that kind of thing never happens anymore!) [Sarcasm, of course.] Civil wars between rival claimants for the throne broke out at the time of the barbarian invasions, and plagues had disastrous consequences for the population. And the innumerable wars! Meanwhile, to quote an anonymous ancient author, “the houses of the powerful were crammed full and their splendor enhanced to the destruction of the poor, the poorer classes of course being held down by force. But the poor were driven by their afflictions into various criminal enterprises, and losing sight of all respect for the law, all feelings of loyalty, they entrusted their revenge to crime. For they inflicted the most severe injuries on the empire, laying waste the fields, breaking the peace with outbursts of brigandage, stirring up animosities; and passing from one crime to another they supported usurpers.”

The huge army and civil service became a “fearful burden” on the Graeco-Roman economy, sucking up more and more surplus from the peasantry above all. In addition, from the second decade of the fourth century onwards the new economic burden of a large body of clerics, monks, and nuns appeared. Probably hundreds of thousands by the mid-fifth century. Most of these people had been withdrawn from production and so couldn't be exploited by the upper class or contribute financially to the maintenance of the state. The Church itself, which became fabulously wealthy, was given much money by the state and by offerings of the faithful—and the Church was economically unproductive, a giant parasite. The incomes of bishops were sometimes larger than that of any provincial governor. “The staffing of the Church absorbed far more manpower than did the secular administration [of the empire] and the Church's salary bill was far

¹ See Peter Coy, “The Richest Rich Are in a Class by Themselves,” *Business Week*, April 3, 2014.

heavier than that of the empire.” (On the other hand, the Church did give perhaps a quarter of the income of its endowment to charity. So that was useful.)

I'll quote the book's last paragraph:

I hope it is now clear how I would explain, through a class analysis, the ultimate disintegration of a large part of the Roman empire—although of course a Greek core, centered above all in Asia Minor, did survive for centuries. I would keep firmly in view the process of exploitation which is what I mean primarily when I speak of a “class struggle.” As I see it, the Roman political system (especially when Greek democracy had been wiped out) facilitated a most intense and ultimately destructive economic exploitation of the great mass of the people, whether slave or free, and it made radical reform impossible. The result was that the propertied class, the men of real wealth, who had deliberately created this system for their own benefit, drained the life-blood from their world and thus destroyed Graeco-Roman civilization over a large part of the empire¹... That, I believe, was the principal reason for the decline of Classical civilization. I would suggest that the causes of the decline were above all economic and social. The very hierarchical political structure of the Roman empire, of course, played an important part; but it was precisely the propertied class which in the long run monopolized political power, with the definite purpose of maintaining and increasing its share of the comparatively small surplus that could be extracted from the primary producers. By non-Marxist historians this process has normally been described as if it were a more or less automatic one, something that “just happened.” ...[As Peter Brown says,] “Altogether, the prosperity of the Mediterranean world seems to have *drained to the top* (my italics)—Brown is speaking of the fourth century, and he has just mentioned that in the western part of the empire, in that century, the senatorial aristocracy was “five times richer, on the average, than the senators of the first century.” ...If I were in search of a metaphor to describe the great and growing concentration of wealth in the hands of the upper classes, I would not incline towards anything so innocent and so automatic as drainage: I should want to think in terms of something much more purposive and deliberate—perhaps the vampire bat. The burden of maintaining the imperial military and bureaucratic machine, and the Church, in addition to a leisured class consisting mainly of absentee landowners, fell primarily upon the peasantry, who formed the great bulk of the population; and, ironically enough (as I have already explained), the remarkable military and administrative reorganization effected by a series of very able emperors from the late third century to the end of the fourth (from Diocletian and Constantine to Theodosius I) succeeded in creating an even greater number of economically “idle mouths” and thus increased the burdens upon an already overburdened peasantry. The peasants were seldom able to revolt at all, and never successfully: the imperial military machine saw to that... But the merciless exploitation of the peasants made many of them receive, if not with enthusiasm at least with indifference, the barbarian invaders who might at least be expected—vainly, as it usually turned out—to shatter the oppressive imperial financial machine. Those who have been chastised with scorpions may hope for something better if they think they will be chastised only with whips. [A reference to a verse in the Old Testament.]

Such is the story of the Roman empire, and of human history.

*

I read J. L. Mackie's classic *Ethics: Inventing Right and Wrong* (1977). It's an eminently sensible book, whose basic ideas I had arrived at in my early-to-mid twenties. It's incredible that nearly all moral

¹ Speaking of draining life-blood, see Steve Johnson, “Capital gobbles labour's share, but victory is empty,” *Financial Times*, October 13, 2013. As the wealthy get richer and richer, aggregate demand shrinks, which leads to economic stagnation and crisis. Ultimately, perhaps, revolution.

philosophers reject this kind of moral skepticism, this “error theory,” which is so intuitively obvious to me. *Obviously* value-judgments aim at, or presuppose, or express a belief in, objective values, and *obviously* there are no such things. Now I’m reading *A World Without Values: Essays on John Mackie’s Moral Error Theory* (2010). Looking forward to defending a commonsense meta-ethics after I’ve read all this tedious literature. –It’s annoying not to be able to *write* (for now), only *read*. Writing is what I enjoy, though it can be difficult and slow; reading is only an irksome prerequisite to writing.

I’ve radically revamped my website, www.wrightswriting.com, so that now it’s a real website and even aesthetically pleasing. Posting lots of writings—book reviews, poems, essays, scattered thoughts, etc. Here are more notes, this time on a book I first read a couple years ago:

The Rise of the Right

We all know that the world is absurd, in the deep existentialist sense. You want proof? Bill O’Reilly’s books are bestsellers, while the phenomenal *Right Turn: The Decline of the Democrats and the Future of American Politics* (1987), by the political scientists Thomas Ferguson and Joel Rogers, languishes around #1,700,000 on the Amazon ranking. This fact actually points to one of the major reasons for the world’s absurdity, which is also the focus of Ferguson and Rogers’ book: the power of money and property, which promotes the Bill O’Reillys and sabotages the Thomas Fergusons.¹ It shouldn’t surprise us that in a world run by big business, or more broadly power-structures—which necessarily aim at maintaining and increasing their own power—the popularity of a product or a person will tend to be inversely proportional to the intrinsic worth of that product or person. Thus, a book that largely explains how American politics began the trajectory to its present catastrophic state will be ignored, because no one knows about it.

How did neoliberal conservatism become the reigning ideology in the 1980s and afterwards? How did conservative Republicans conquer the political world, after their defeats (punctuated by periodic victories) from the 1940s to the early 1970s? How is it that the Republican Party has shifted to the lunatic, quasi-fascist right while the Democratic Party has become what moderate Republicans once were? Is it because the American public became more conservative in the 1980s, as one might naturally think? Were Samuel Huntington and his ilk right in arguing that the Democratic debacle of 1984, when Reagan won in a landslide against Walter Mondale, was the result of the party’s having been taken over, in the 1960s and 1970s, by selfish and divisive “special interests” like labor unions, black groups, women’s rights organizations, and Hispanic associations? Journalists, academics, and politicians confidently declared that American voters had repudiated the New Deal, and that, in order to survive, the Democratic Party “had to stop resisting the drift of the majority of the electorate toward conservative, entrepreneurially oriented social and economic policies, increased military spending, and more actively anti-Communist, interventionist foreign policies,” as Ferguson and Rogers (or FR, as I’ll call them) paraphrase. The famed New Deal coalition of minorities, women, blue-collar workers, and white Southerners had split apart amid the social turmoil of the 1960s and ’70s, and—these pundits argued—it was necessary now for the Democrats to reach out again to the more conservative parts of their former base, notably those white Southerners who had defected to the Republicans in their disgust at anti-war hippies and pro-black federal policies. –Is this analysis right? Had the public, by reelecting Reagan in a landslide, indeed repudiated the New Deal, with its progressive income tax, business regulation, social-welfare programs, and protection of unions? No, say Ferguson and Rogers. The story is much more complicated than that, as they demonstrate in their book.

We should keep in mind that the conventional diagnosis, which FR argue against, has had staying power. It was the justification given for the Democrats’ rebranding of themselves as “New Democrats” in the time of Bill Clinton, when the party embraced the ideology of limited government, the so-called free market, gutting of the welfare state, and other ideas that had traditionally been the domain of Republicans. It has been the constant refrain of pundits seeking to explain the latest Democratic defeat: “liberals are out of touch with the values of mainstream America,” etc. The analysis has been trotted out so many times that

¹ For the story of how Ferguson was denied tenure at MIT, see Noam Chomsky, *Understanding Power* (New York: The New Press, 2002), 243.

it's become a cliché; it's considered so obvious as scarcely to require arguing for. Nevertheless, it's either flatly false or wildly misleading.

Despite the conventional wisdom of intellectuals, the public has *not* become more conservative. The Gallup, Pew Research Center, and World Public Opinion websites provide an abundance of evidence for the fact that the electorate has steadily continued to have social-democratic values for many decades, in fact at least since the 1930s. Certainly misinformation campaigns and barrages of propaganda—for instance to drum up support for wars—are sometimes temporarily reflected in polls, but the underlying values of support for unions, social welfare, national health insurance, environmental protection, progressive taxation, business regulation, cuts in military spending, infrastructure development, and so on remain quite stable. No great changes have happened since the 1960s—except, as FR show, that public opinion has become *more* liberal, not less! With regard to the 1980s, the authors give overwhelming evidence that the electorate largely rejected the Reagan administration's policies. For example, after studying polls, the *New York Times* concluded in 1986 that voter attitudes since the 1970s had shown “no consistent evidence of change, certainly not in a conservative direction.” On religion, feminism, civil liberties, abortion, and race relations, a sharp increase in liberal attitudes had occurred since World War II. It's true that a majority of people in the late 1970s thought that the tax system had in recent decades become more unfair—because it had: it was much less progressive than in the early 1950s. Naturally, then, as taxes (especially payroll taxes) fell more and more heavily on ordinary people, they became more resistant to tax hikes and more receptive to politicians' promises to cut taxes, especially on the middle and lower classes—*not* on the rich, which is what happened under Reagan. Support for cuts in military spending as opposed to cuts in social spending substantially increased in the 1980s, though the Reagan administration was doing the opposite. Likewise, public aversion to nuclear weapons was strong and growing, and arms control met with widespread approval.

It's been claimed that Reagan was a uniquely popular president, but this is false. During his first term his approval rating averaged 50 percent, lower than Eisenhower's 69, Kennedy's 71, Johnson's 52, and Nixon's 56. As economic conditions improved in the mid-1980s, Reagan's popularity rose, though still remaining far below that of Eisenhower. But “if one controls for economic conditions, Reagan's popularity does not differ significantly from Jimmy Carter's.” Ha! What a preposterous mythology has been constructed in the last thirty years.

Nor was there a major realignment of voter allegiances toward the Republicans. The 1980 election was more a negative referendum on Carter than an endorsement of Reagan. And in 1984, below the presidential level Republicans' gains were unimpressive. Reagan himself garnered only 32.3 percent of the potential electorate, given the numbers of people who abstained from voting. And, strikingly, several liberal Democratic senators (like Tom Harkin and Paul Simon) won against incumbents in states that Reagan decisively carried. So much for the idea that voters realigned towards Republicans in the 1980s—or afterwards, for that matter. (Power has continued to fluctuate between the two parties.) Reagan's electoral victories were mainly just a function of the country's positive economic performance in 1984, having little or nothing to do with support for his policies.

What about those “conservative” white males who had left the Democratic Party after the 1960s? Wasn't it—and isn't it—a good idea to try to get them back? Sure. But “the overwhelming importance of economic issues undermines revisionist arguments about the need to make conservative ideological appeals to parts of the old New Deal base. Even accepting the proposition that Southern white males need to be attracted back to the party, for example, the evidence suggests that the surest way to do that is not by abandoning Southern blacks but by running hard on economic issues that unite low-income groups across racial lines.” Excellent point. There's no need to ape conservative Republicans; just address issues that blue-collar workers care about, like wages and the revitalization of decaying communities. The problem, of course, is that to do so means antagonizing big business. That's the Democrats' handicap: it's hard to be a party of big business and the popular majority at the same time. One set of class interests is inevitably sacrificed for the other; and usually it ends up being the people's interests that are sacrificed, because business has the money. (The Republicans' problem is different: how to attract votes when your *only* real

constituency is the rich? The only way to do so is to delude, by appealing to nationalistic emotions, cultural issues, religious fundamentalism, racism, and other such fascist things.)

Having said all this, the point of the rest of the book is clear. As the authors state,

Before the United States wrecks its cities, shrinks its education system, abandons the regulation of business, turns the back the clock on rights for women, blacks, and Hispanic Americans, reverses the progressive income tax, heats up the arms race, invades another Third World country, or simply eliminates unions, we need to take a hard look at the recent history of the American political system. [A prophetic litany of horrors!] How and why did the New Deal political system decline? If, as the poll data suggest, public attitudes toward major policy questions have remained programmatically liberal, how does one account for America's right turn in the 1970s? Why did leaders of the major parties keep trying to jettison more and more of the New Deal's programs, including domestic programs that are popular with vast numbers of voters? Why did they repeatedly insist on pursuing sharply deflationary monetary policy, often at great electoral cost? [And why did Walter Mondale choose to stand for a paradoxical and self-destructive set of policies in his 1984 campaign, including unpopular tax increases?] ... These are the questions we seek to answer in this book.

To do so, they start with a general consideration of what it is that produces massive policy changes of the sort that happened in the 1980s, when the New Deal system began to be dismantled. The conventional view among political scientists is the (seemingly) commonsense one: *voters* are the key factor. They're the ones with the power, who determine policy priorities. The broad theory is called "critical realignment theory"; in brief, it "understands political change primarily in terms of *changing patterns of mass voting behavior*." I'll quote from Ferguson's fantastic book *Golden Rule: The Investment Theory of Party Competition and the Logic of Money-Driven Political Systems* (1995):

Most American elections [according to mainstream critical realignment theory] are contests within comparatively stable and coherent "party systems." While any number of short-term forces may momentarily alter the balance of power within a particular party system, and cumulative, long-run changes may also be at work, the identity of individual party systems rests on durable voting coalitions within the electorate. So long as these voting blocs (which in different party systems may be defined variously along ethnic, class, religious, racial, sexual, or a plurality of other lines) persist, only marginal changes are likely when administrations turn over. Characteristic patterns of voter turnout, party competition, political symbols, public policies, and other institutional expressions of the distribution of power survive from election to election.

"Normal politics,"¹ of course, is not the only kind of politics that occurs in the United States. The "critical realignments" of critical realignment theory refer to a handful of exceptional elections—those associated with the New Deal and the Great Depression of the 1930s, the Populist insurrection of the 1890s, the Civil War, and the Jacksonian era are most frequently mentioned, though other dates have also been proposed—in which extraordinary political pressures find expression. Associated with the rise of new political issues, intense social stress, sharp factional infighting within existing parties, and the rise of strong party movements, these "critical" or "realigning" elections sweep away the old party system. Triggering a burst of new legislation and setting off or facilitating other institutional changes that may take years to complete, such elections establish the framework of a new pattern of politics that characterizes the next party system.

This theory emphasizes popular control of public policy; sweeping changes, as happened in the 1930s and 1980s, are ascribed to voter sentiment. Unfortunately, a lot of evidence has been collected that suggests that "the durable voter coalitions which are supposed to underlie party systems never existed, and that so-called

¹ Cf. Thomas Kuhn's "normal science," described in *The Structure of Scientific Revolutions* (1962). Kuhn was a famous philosopher of science who radically changed scholars' understanding of how science makes progress.

critical realignments are not only very difficult to define, but simply have not witnessed major, lasting shifts in voter sentiment.” Three researchers sympathetic to the theory argue that, contrary to its predictions, “indications of substantial continuity of the alignment of electoral forces across virtually the whole sweep of American electoral history can be observed... Electoral patterns do not, by themselves, clearly and unequivocally point to the occurrence of partisan realignment.” In other words, partisan realignments, which have indisputably occurred periodically, can apparently not be explained by (massive changes in) electoral behavior. So we need another explanation.

Incidentally, the Marxist in me can’t help remarking that, in a capitalist society, nothing is more predictable than mainstream intellectuals’ adherence to this naïve *voting*-based analytical framework. As if ordinary voters are the ones who have real power! *Class* is invisible to most academics, because these people are not thinkers but careerists. “What, *wealth* as the determinant of power?! Absurd! Reductive! Vulgarly Marxist! Money and wealth have nothing to do with it! We live in a perfectly pluralist society in which all groups have approximately equal power!” I don’t understand how such fantasies are possible.

Anyway, Ferguson and Rogers provide a more sensible explanation, in which *business elites*, not voters, play the leading part. Political parties are not what they have typically been conceived of, as machines to get out the vote. Instead, their real market consists of major “investors.” (The word “investor” is to be understood in a broad sense, as people and institutions with the resources to invest a lot of time and money in trying to control the state.) “Blocs of major investors define the core of political parties and are responsible for most of the signals the party sends to the electorate.” Voters, then, are a secondary, though necessary, factor.

During realignments [Ferguson argues] basic changes take place in the core investment blocs which constitute parties. More specifically, realignments occur when cumulative long-run changes in industrial structures (commonly interacting with a variety of short-run factors, notably steep economic downturns) polarize the business community, thus bringing together a new and powerful bloc of investors with durable interests. As this process begins, party competition heats up and at least some differences between the parties emerge more clearly... Assuming that the system crisis eventually eases...the fresh “hegemonic bloc” that has come to power enjoys excellent prospects as long as it can hold itself together. Benefiting from incumbency advantage and the chance to implement its program, the new bloc’s major problem is to manage the tensions among its various parts, while of course making certain that large groups of voters do not become highly mobilized against it—either by making positive appeals to some or by minimizing voter turnout, or both.

Ordinarily most voters can have almost no influence on policy because they’re prevented from sufficiently investing themselves in it. They have other priorities, e.g., living their lives. Hence, it will be major investors who set the political agenda. One predictive consequence of this theory is that “on all issues affecting the vital interests that major investors have in common, no party competition will take place.” This is clearly borne out by the evidence. Certain issues, namely the ones most important to voters, rarely show up in campaigns; and when something like healthcare reform does, it’s because one bloc of major investors no longer has an interest in ignoring it. (If you look at polls you’ll see that voters’ attitudes on healthcare reform haven’t changed much in decades: they’ve wanted national health insurance. But major investors haven’t, so it hasn’t happened.)

To understand how the New Deal system declined, it’s necessary to understand what it was in the first place. And here we encounter another of FR’s challenges to liberal orthodoxy. “At the center of [the New Deal coalition around Roosevelt] were not the millions of farmers, blacks, and poor that have preoccupied liberal commentators, nor even the masses of employed or striking workers who pressured the government from below (and later helped implement some of the New Deal’s achievements), but something else—a new power bloc of capital-intensive industries, investment banks and internationally oriented commercial banks.” Ferguson describes in *Golden Rule* how this bloc was forged in the 1930s, but I’ll skip the very interesting history. The point is that, unlike labor-intensive industries such as textiles, firms in capital-intensive industries were not profoundly threatened by labor turbulence and organization. They

could thus afford to join a coalition with organized labor starting around 1935, thereby making possible the relatively left-wing “second New Deal” (exemplified by the Wagner and Social Security Acts—which businesses in the new Roosevelt bloc, far from opposing, helped write). “Because most large capital-intensive firms (with the important exception of the heavily protectionist chemical industry, which did not belong to the bloc) were world, as well as U.S., pace-setters, they stood to gain from global free trade. They therefore allied themselves with leading international financiers, whose own minuscule workforce presented few sources of tension, and who had supported a more broadly internationalist foreign policy and lower tariffs since the end of World War I. Together, members of this bloc provided the needed business support for the two broad policy commitments—liberalism at home, internationalism abroad—centrally identified with the New Deal.”

This bloc was a small part of the business community in the 1930s, but it was immensely powerful. It included many of the largest and fastest-growing corporations in the country, including General Electric, IBM, Pan Am, oil companies like Shell, Standard Oil of New Jersey and Standard Oil of California, and banks like Chase National Bank, Bank of America, Goldman Sachs, and Lehman Brothers. The controlling interests in these businesses also dominated leading American foundations, and so could exercise major influence on political opinion and public policy. Once this bloc had come together and allied with Roosevelt, it dominated policy for a generation. “The administration embarked on a historic program of trade liberalization and efforts at currency stabilization,” which after World War II took the form of the famous Bretton Woods system that lasted until the early 1970s. As you may know, “Bretton Woods established the dollar as the ‘vehicle’ currency to be used in the conduct and financing of international trade, and brought order to foreign-exchange markets by establishing a system of fixed exchange rates among the world’s currencies, tied to the dollar; the dollar, in turn, was convertible to gold.” The various institutional innovations of Bretton Woods helped make possible the incredible growth of the American and world economy in the postwar period.

Despite many successes, the Democratic coalition, both in its business and its electoral dimensions, wasn’t particularly stable; in some respects it was already starting to disintegrate in the 1940s, as the labor movement ran into difficulties that included a catastrophic failure to organize workers in the South, and a failure to prevent the rabidly anti-union Taft-Hartley Act from being passed in 1947. Unions grew more conservative as radicals were purged, and in the context of the Cold War, no more great liberal or left-wing crusades were possible for a while. Moreover, racial conflicts between white and black workers were already breaking out in cities like Detroit in the mid-1940s; these presaged the conflicts that erupted in full force later, in the 1960s, and that ultimately doomed the New Deal’s electoral coalition. Still, for a few decades the New Deal’s basic program was solidly entrenched: social welfare, trade unionism, minority rights, expanded popular participation in government, the concept of a progressive income tax, and free trade. When in power, Republicans dared not stray far from it, even though their business constituency of labor-intensive firms surely wanted them to. (Such firms were opposed to both free trade—foreign competition—and protection for unions, but in the postwar era they didn’t have enough power to push through their program.)

It was in the 1960s that things started to get tougher for the New Deal coalition. Kennedy was firmly in the multinational camp, so he promoted free trade and lowered taxes on corporations and the rich, which contributed to an economic takeoff after the recession of 1957–58. “With the growing boom, imports exploded, threatening many traditional, labor-intensive Republican manufacturers, as well as some primary producers and national oil concerns. Joined by many agricultural interests and smaller businesses who received little or no benefit from the investment-oriented tax cuts and who often feared the effects of rising social spending on their supplies of low-wage, unskilled labor; copper companies, whose prices were collapsing; some defense contractors; and many leftover opponents of the New Deal—these groups went on the offensive.” These conservative forces increasingly took over the Republican Party, writing an import-restriction clause into the party platform, denouncing the UN and internationalism, and nominating Barry Goldwater for the presidency in 1964.

At the same time, as you know, the civil rights movement was attaining national prominence. Multinational elites, who were already losing what remained of their position in the GOP, decided they had

to secure the power of the Democratic Party for a generation. Solidifying the loyalties of black people, while permitting them the right to vote in the South, would help achieve that goal. So they supported and funded the civil rights movement. After Kennedy's death, these multinational, capital-intensive firms lined up behind LBJ and his Great Society (and staffed the upper tier of his administration), since in a context of vigorous economic growth they had no reason to fear increased social spending. More tax cuts and trade liberalization followed, and large U.S. military budgets made possible the repeated application of force abroad (e.g., in Latin America) to secure these businesses' overseas investments. But not only the elite was doing well: workers had more jobs and higher wages, and social welfare spending rose dramatically under LBJ. So, all in all, things looked pretty good for the Democratic coalition, especially since Goldwater had been thrashed in the 1964 election.

What went wrong? Historians often argue that the major Democratic catastrophe was Vietnam, but this likely isn't the case. It's true that the war divided business interests in the Johnson coalition. "The fabulous dollar outflow that the war entailed exacerbated the already shaky U.S. balance of payments. As pressure mounted on U.S. gold reserves, the [value of the] dollar itself increasingly came into question, threatening its key role in the Bretton Woods financial system." Unless this threat was checked, foreign deposits would leave U.S. banks, which would therefore see their position in the world economy decline. Other multinationals had their own reasons to question the war, and by 1968 were pressuring Democratic politicians to speak out against it. LBJ himself was finally persuaded to start drawing down troop commitments. All this embittered hawks in the party and strained the coalition's cohesiveness. But there were few long-term consequences: after the war ended, dovish and hawkish party elites reunited (in 1976).

More significant was the decline of organized labor. It remained very powerful in the 1960s, but its strength was waning. Democrats effectively ignored it on signature issues as sectors of the business community mobilized against unions; and ever freer trade was having a devastating impact on union jobs, such as in textiles, shoes, and steel. Kennedy and Johnson refused the import protections that both labor and some manufacturers wanted. At the same time, labor failed to broaden its power by organizing new workers—except for government workers, which wasn't enough to make up for losses in the private sector. Union density in the civilian work force decreased from 26 to 21 percent between 1970 and 1980 (and continued its decline thereafter). Nor did unions expand significantly in the South and West, which were the fastest-growing regions in the country. Thus, organized labor remained a basically regional phenomenon, concentrated in the East and Midwest. Also, its stance towards the women's movement, the black movement, and the environmental movement did it no favors: as is well known, the AFL-CIO was quite conservative, thereby abdicating its leadership role (and the benefits that could have come from it) with respect to social movements and large parts of the population. Conversely, these other groups were forced to turn to liberal corporate-dominated foundations and media for support, which left them vulnerable when these elites decided to pull back on their support for social action in the late 1970s. In short, "labor unions would continue to lose members, and millions of blacks, women, and Hispanics fail to get the unions they needed. Having abandoned most efforts to reach (increasingly Southern and Western) white male blue-collar workers who were not organized, as well as most blacks and women, the movement that could most sensibly claim to represent almost every ordinary American's general interest could hardly avoid looking more and more like the 'special interest' of a lucky few."

In addition to this is the sordid story of organized labor's support for imperialist foreign policy in Indochina and Latin America. Perversely, it helped subvert left-wing opposition movements around the world, which was destructive to its own membership in the United States. American aid used to prop up regimes that repress their own citizens and their wages "in effect subsidizes multinational expansion abroad by lowering the costs of that expansion—either by lowering wages or by reducing risks of popular (and investment-threatening) social upheaval in repressive regimes." Particularly with post-1950s advances in communications and transportation, outsourcing became more common: businesses could relocate to areas with cheaper labor (or use the threat to do so to force concessions from their workforces), and a tidal wave of low-cost imports contributed to America's deindustrialization—which also meant de-unionization.

As if all this weren't enough, the AFL-CIO's abandonment (in the 1960s) of the fight to expand the progressive income tax had disastrous consequences. It enabled Kennedy and Johnson to finance most

of their social programs by a rise in the social security tax, the most directly regressive of all American federal taxes. “Especially when combined with the cuts in corporate tax rates, and the proliferation of corporate credits, this step made the tax system significantly less progressive than it had been, while sharply increasing tax burdens on those who could least afford it.” As I said earlier, it’s therefore understandable why so many people would later embrace a political party (the Republican) that promised to lower taxes. Especially in light of another disastrous fact, namely that the multinational constituency that largely designed Johnson’s Great Society urban and social programs crafted them in the interests of mortgage bankers, downtown merchants, big developers, and, in the case of medical programs, pharmaceutical companies, large foundations, the American Medical Association, big hospitals, and insurance companies. This meant that the programs would be costly and inefficient, difficult to reform (because of their powerful support from business), and prone to increasing the burden on the average taxpayer (as they grew more expensive). “It was a system that could hardly avoid inflaming tensions between different groups of middle- and lower-income Americans.” In the end, the Republican Party proved to be the main beneficiary of these tensions.

Not immediately, though. The Nixon administration didn’t represent the end of the New Deal system. It encapsulated a highly fragmented regime, and, as FR say, is best thought of as a typical transition product of a party system in disintegration. The old opposition to the New Deal, including protectionist interests like textiles and steel and independent oil companies, allied uneasily with an odd assortment of multinationally oriented figures like Henry Kissinger. As a result, the administration pursued rather schizophrenic policies. On some issues, like civil liberties and “law and order,” it was definitely more conservative than Johnson; on others, like social spending and environmental protection, it was quite liberal. “The reason is straightforward. As Nixon himself clearly sensed, the part of his bloc that was tied to the ‘Eastern liberal establishment’ largely retained its commitment to the policy formulas of the New Deal.” True, it was concerned about wage pressures and lagging productivity, but it didn’t think these necessitated an all-out attack on the welfare state; instead, a short period of monetary austerity would probably be sufficient. As for Nixon’s environmental regulation: this wasn’t, as people are wont to think, merely a manifestation of “the public” winning a battle against “business.” Rather, many among the upper classes, such as increasing numbers of bankers, brokers, insurers, and real-estate magnates, who enjoy the environment as much as anyone else, used their clout—while cooperating with popular movements—to push for regulation. Developers, fisheries, and tourist-oriented businesses rose up against oil spills off their coasts; Eastern coal producers tried to use “clean-air requirements” to cripple Western producers; and lawyers, “overjoyed to discover fertile new areas for expensive litigation,” in the early 1970s rushed to file suits against polluters.

The one area in which the Nixon administration did depart from the New Deal framework was in its temporary New Economic Policy (in 1971), which instituted wage- and price-controls to curb continuing pressures to inflation, suspended the dollar’s convertibility into gold (allowing it to float against other currencies and lose value, because it had been highly overvalued), and a ten-percent surcharge on many imports. All this broke with multilateralism and free trade, and led to protests from some business groups. FR have a detailed discussion of these issues, and of the epoch-making demise of the Bretton Woods system in 1971/73, but the upshot is that Nixon was able to placate the internationalists and prevent them from going over *en masse* to the free-trade Democrats. This was made easier by the fact that George McGovern was the Democrats’ presidential nominee in 1972, a man so liberal that even much of the liberal Eastern establishment considered him beyond the pale. So they supported Nixon, who was reelected. What happened next, though, is more important: when the Federal Reserve tightened up the money supply after the 1972 election, the recession that was expected turned out not to be a mild one like 1969–70 but a more protracted and severe one. The American economy, and most of the developed world, entered its worst period since the Great Depression—which took the whole business community by surprise. Even after the recession had ended, U.S. wages, profits, productivity growth, and export shares kept dropping; only inflation and imports rose.

So, “the recession that began at the end of 1973, and stretched through the beginning of 1975, was a watershed event in American political economy. It marked the end of the long period of growth that had

been sustained since World War II, underscored the changed position of the United States in the world economy, and ushered in a sustained period of stagflation. It was then that American politics finally made its decisive turn to the right.” The beginning of FR’s chapter on “the dismal 1970s” states the main points clearly:

Deteriorating U.S. economic performance in an increasingly competitive and integrated world economy is the analytic key to the Democrats’ decline. In a variety of ways, sagging growth and profits at home, and increased competition abroad, made the business community much more cost-sensitive. This stiffened business opposition to the growth of social spending and forced the Democrats to work within tighter fiscal constraints on their domestic programs. Pressures on the social side of the budget increased as growing U.S. involvement in the international economy, and in particular in the Third World, widened demands within the business community for increased military spending. Moreover, these competing demands on the budget could not be easily reconciled by simply raising taxes, for as profit margins sagged and intensified competition from abroad made it more difficult for corporations to pass taxes through to consumers, much of the business community was mobilizing in support of further tax reductions. Over the course of the decade, the convergence of these different pressures and demands produced a growing budget crisis in the United States, in effect forcing a choice between social and military spending.

For the Republicans, pressures to make this choice presented an enormous political opportunity. Unencumbered by a mass base...the Republicans were quite prepared to serve as a vehicle for tax and domestic-spending cuts and increased military outlays. For the Democrats, however, the growing tradeoff between guns and butter forced the party to walk a political tightrope between the demands of its elite constituency and the needs of its mass base. Even as the Democrats moved to the right over the course of the decade and the center of American party politics shifted, the tensions within the Democrats’ ranks made them a less efficient vehicle for business aspirations than the Republicans. The GOP was thus the first beneficiary of America’s right turn.

These ideas harmonize well with Robert Brenner’s brilliant arguments in *The Economics of Global Turbulence* (2006), which I’ve summarized in *Finding Our Compass*. FR give a lot of useful background information on the economic context of the time, but here I’ll just refer you to my discussion of Brenner’s book. The point is that U.S. competitiveness was in decline, especially in manufacturing.

Businesses responded to economic deterioration in predictable ways: by relocating to the South or West, where labor was cheaper because unions were rare; by regularly violating national labor laws; and by trying to improve their bargaining position with workers in various ways. And as we’ve seen, most of organized labor was perfectly happy to be ineffectual and see its power decline. Still, we shouldn’t overestimate the importance of these wage and unionization issues in causing America’s right turn. The employer offensive, by hurting labor, did marginally hurt Democrats’ capacities of voter-mobilization, and it weakened resistance within the party to the rise of conservatism. “But the decline in labor’s power in the 1970s only continued a long downward slide evident since at least the mid-1950s. It was not a new development, unique to the later period, that can be looked to as precipitating a general policy realignment.” In fact, because Democrat-supporting capital-intensive firms didn’t have to worry so much about labor costs, “the labor question alone probably squeezed comparatively few traditionally Democratic firms out of the party.”

So we have to look to other causes as well. One of them is the issue of *regulation*. “Reeling from intense foreign competition, many sectors of big business, *including* several of the most capital-intensive multinational ones, such as pharmaceuticals, paper, and petrochemicals, lashed back at what they claimed were ‘unduly burdensome’ government regulations—in particular ‘social’ regulations of the environment and worker safety that fell particularly hard on these sectors.” As many studies have shown, for example David Harvey’s *A Brief History of Neoliberalism* (2005), these regulated industries launched major efforts to influence public opinion and elite attitudes, e.g., by sponsoring studies that downplayed environmental risk, cultivating ties with university researchers, supporting “neoconservative” journals, funding broad

campaigns extolling the virtues of “free markets,” and creating new conservative policy institutes like the Heritage Foundation. By the mid-1970s, U.S. businesses were spending more than \$400 million a year on “advocacy advertising,” much of it directed against government constraints on business. By the end of the decade it was up to \$1 billion annually. This whole neoliberal corporate movement weakened the Democratic base in the business community and in the country as a whole.

—I can’t resist inserting a polemical digression here. The authors mention in a footnote that John S. Saloma III gives a detailed survey of all these propagandizing activities in *Omnibus Politics: The New Conservative Labyrinth* (1984). “His study,” they say, “is one of the very few to bring out the importance of the astronomical sums of money lavished on these activities, in contrast to the customary rhetoric about the importance of ‘new ideas.’” They’re right about the latter: intellectuals love to insist on the importance of “powerful new ideas” in explaining changes in society and politics. It’s predictable—predictably bourgeois in deflecting attention from class and institutional structures—but it’s stupid. John Maynard Keynes gave a classic exposition of this idealist philosophy in the very last paragraph of his *General Theory of Employment, Interest and Money* (1936), which has stroked the egos of academics for generations:

...[T]he ideas of economists and political philosophers, both when they are right and when they are wrong, are more powerful than is commonly understood. Indeed the world is ruled by little else. Practical men, who believe themselves to be quite exempt from any intellectual influences, are usually the slaves of some defunct economist. Madmen in authority, who hear voices in the air, are distilling their frenzy from some academic scribbler of a few years back. I am sure that the power of vested interests is vastly exaggerated compared with the gradual encroachment of ideas. Not, indeed, immediately, but after a certain interval; for in the field of economic and political philosophy there are not many who are influenced by new theories after they are twenty-five or thirty years of age, so that the ideas which civil servants and politicians and even agitators apply to current events are not likely to be the newest. But, soon or late, it is ideas, not vested interests, which are dangerous for good or evil.

These are backward fantasies, which grow out of a poor sociological imagination. The point is that the ideas that come to be accepted as gospel are those useful to vested interests, which are the entities that have the resources to propagate them. (In the typically bourgeois language of impersonal ‘automaticity,’ Keynes refers to “the gradual encroachment of ideas.” But ideas don’t spread of themselves; they are propagated and subsidized by people and institutions whose interests they express. This is why “the ruling ideas of a society are the ideas of its ruling class,” which has the resources to spread them.) Keynes’ famous book itself contributed not at all to the so-called Keynesian policies of FDR and Hitler and others; in fact, such policies were already being pursued by Baron Haussmann in France in the 1850s, because they were useful in giving employment to thousands of workers and raising aggregate demand and thereby economic growth. Is it likely that had Keynes not published his book in 1936, the U.S. government during and after World War II would have pursued radically different, un-Keynesian economic policies? Hardly. Because they were useful to vested interests, those policies were bound to be adopted—and economists, tools of the ruling class, were bound to systematize their theoretical rationalizations sooner or later. Incidentally, in some form they had been around already in the late nineteenth century, long before Keynes, among liberals and socialists, “underconsumptionists” like John Hobson and many others. But they didn’t become conventional wisdom until major parts of the ruling class had taken them up between the late 1930s and early 1970s. After their usefulness had ended, in the 1970s, they were abandoned, and a new, neoliberal, ideological crusade began, which was predictably successful because it was waged by the most powerful actors in society. The falseness and superficiality of the “supply-side” ideas of Reaganomics were no great hindrance to their political success, because *theory* doesn’t matter in the real world—despite what self-apologists like Keynes and other liberals (Paul Krugman, etc.) might think.

—Let’s return. Not only domestic but also international factors were relevant to the decline of the Democratic New Deal order. One of the most momentous was the huge rise in oil prices that OPEC orchestrated in 1973. Something that’s forgotten now is that for a long time the oil industry—the biggest

and most powerful of America's capital-intensive industries—was disproportionately Democratic, because it could afford not to be intensely hostile to organized labor. In 1936, FDR raised more money from Texas than any other state; and Truman, but especially Kennedy and Johnson, had close ties with various oil companies. “In the twinkling of an eye, however, OPEC did what a generation of Republicans, anti-oil populist Democrats, and even the old Tidelands Oil controversy were never able to do. It built a virtual Chinese Wall between oil and the Democrats.” This, of course, was quite bad for the Democrats.

The story is that, as oil and gas prices soared in 1973, the government tried to hold down the domestic prices by a complex system of price controls—much to the displeasure of oil and gas companies. A debate raged on whether the controls should be lifted, but the Democratic Party couldn't sponsor lifting them, because they were so important to labor, blacks, and the poor. “As a consequence, and particularly after the strongly Democratic ‘Watergate Congress’ of 1974 reduced the oil industry's depreciation allowance, virtually the entire oil industry began going over to the Republicans.” This move was confirmed when, a few years later, Jimmy Carter pushed for a “windfall profits” tax on the oil industry. Thereafter, this powerful industry concentrated on electing Republicans, who were happy to let the “free market” set energy prices. In addition to this, though, were other subtler consequences of the boom in energy prices:

For years, some very large fortunes in the South and West had strongly opposed the New Deal. Composed chiefly of growers and independent oilmen in Texas, Oklahoma, and California, this bloc had long patronized right-wing fundamentalist religious activities and spokespersons and other ultraconservative groups. As the boom in energy and commodity prices took off, the fortunes this bloc commanded received an automatic assist, with almost immediate political consequences. It stepped up support for various “New Right” spokespersons—including not only many political operatives associated with groups like NCPAC (National Conservative PAC) but also several leading evangelists [including Jerry Falwell]. ...Increased boosting of religious fundamentalism coincided, of course, with a sharp downturn in the well-being of most working- and lower-middle-class Americans. Threatened by imports, rising unemployment, and declining wages, and jostled by the entrance of millions of new women workers (and illegal immigrants) into slack labor markets, many of the most vulnerable members of American society were understandably disenchanted with the profane world (and the “secular humanism” that was said to be its organizing principle). Among at least some of them, inevitably, these religious appeals found wide resonance [and have continued to ever since].

At the same time, elites in mineral-rich Western states stood to profit from price deregulation, and business communities that sought enhanced access to minerals on the huge tracts of Western land controlled by the federal government were bound to support Republicans, who didn't have environmentalists or a mass base to worry about (except for the semi-fascist, religious one they were trying to create). So an organized “Sagebrush Rebellion” began in the West, which laid (absurd) claims to the mantle of populism because its professed goal was recapture by locals of the resources that were controlled by out-of-state forces. —I should mention that this whole narrative and analytic account of the origins of the New Right is grossly simplified. The “movement” was already forming in the mid-1960s, and even, in some respects, the 1950s. A lot of mainstream scholarship describes its genesis from a social history perspective (i.e., why and how ordinary people, suburbanites like Phyllis Schlafly, were drawn to it). But the fact that it didn't really achieve much power until the middle or late 1970s suggests that FR's approach is the most fruitful one: examine why and how *business* funded and directed it. After all, there are always plenty of morons around who can be persuaded of some ideology if it has money and power backing it up. The key is to look at the money and power, not the morons.

Other things were changing too. As détente with the Soviet Union collapsed in the late 1970s, and for many other complex reasons, the business community began to favor an arms buildup, which came to fruition under Reagan. In an environment of slow economic growth, greater military investment would have to be offset by a decline in social spending. Moreover, the gigantic budget crisis of the seventies, a result of insufficient revenues to pay for expanded urban social services and welfare, was met by slashing these

services and some types of public investment. (In *A Brief History of Neoliberalism* David Harvey describes how this was done in New York City in 1975, when the city nearly went bankrupt. The drastic measures taken in that case were to some extent adopted all over the country in the 1980s, to deal with the “urban crisis” and at the same time to create a new kind of city, the neoliberal city, designed for the benefit of the service-sector elite.)¹ In addition, the large cuts in corporate taxes in the 1960s and ’70s, and proliferation of tax loopholes that benefited business, were not enough for the rich: they continued to press for more reductions in corporate and personal income taxes, thus squeezing social spending even more. Hard-pressed working Americans, who were shouldering much of the burden being shed by the rich, were attracted to these anti-tax campaigns, not knowing that the business leaders behind them wanted to replace the income tax with even more regressive sales or consumption taxes. Anyway, the squeeze on social spending “hurt the Democrats far more than the Republicans, since it constrained their ability to deliver the social benefits that had long secured them a mass base. In the new political economy of the late 1970s, the party of Roosevelt, which had long been able to build and maintain its popular base by dolloping out discrete social benefits, no longer had the resources to do so. Indeed, the very existence of that base posed an important barrier to the Democrats’ capacity to realize business objectives. For virtually all sections of the business community, the GOP appeared as a more efficient vehicle for realizing their aspirations.”

In short, what was happening is that even as business was embracing the Republican Party, many ordinary people decided to do so as well because at least it addressed their tax concerns (or seemed to) and wasn’t tarnished by failed promises in the way the Democratic Party was. From a different perspective, you can interpret the situation as follows: a transition was taking place between two ways of organizing the nation-state. The way of (relative) *social integration*, of a somewhat cohesive nation that integrated different classes of people into the social contract, could not withstand intensified international economic competition and integration, because of the costs that maintaining a semi-cohesive nation imposed on business (in the form of social welfare programs, government investment in public resources, high taxes, the empowerment of organized labor, encroachment of populist ideologies, etc.). The Democratic Party was the preeminent political expression of this inclusive organization of the nation-state, which is why its policies and ideology dominated the period from Roosevelt to Nixon. But when that system started to seriously threaten the profits and power of the capitalist class, the latter necessarily, in large measure, abandoned the old policies and liberal ideology for a more harshly capitalist system that would allow it to compete and enrich itself in the new international context. Thus, the transition from liberal-Democrat to conservative-Republican—which has been replicated in other parts of the Western world—was really a transition between *two phases of the nation-state system itself* (and two phases of global capitalism). There’s

¹ To quote from a paper I wrote: “Many scholars of neoliberalism have described how this political-economic system has functioned to redistribute wealth upwards and exacerbate working-class insecurity. The celebrated geographer David Harvey, for example, argues that neoliberalism began in the U.S. in the mid-1970s, when New York City’s fiscal crisis gave investment bankers and their political representatives an opportunity to undo many of the historic achievements of working-class New York by dismantling much of the city’s social and physical infrastructure. Public resources were used to build new infrastructure for finance, legal services, the media, and consumerism, as ‘working-class and ethnic-immigrant New York was thrust back into the shadows, to be ravaged by racism and a crack cocaine epidemic of epic proportions in the 1980s.’ New York City’s investment bankers thus paved the way for a political economy of privatization, the privileging of financial institutions, and ‘urban entrepreneurialism,’ all of which proceeded in the 1980s and 1990s to conquer not only the U.S. but much of the world.

“The contributors to *Spaces of Neoliberalism: Urban Restructuring in North America and Western Europe* (2002) analyze some of the means by which neoliberalism has spread across the world. Jamie Peck and Adam Tickell argue that, given high capital mobility, cities are forced to compete against each other to attract business, by establishing ‘favorable business climates.’ What this entails is deregulation, the undermining of labor unions, and public subsidies to multinational companies. ‘The serial reproduction of cultural spectacles, enterprise zones, waterfront developments, and privatized forms of local governance’ is the natural product of this worldwide inter-urban competition...” A semi-global program of urban beautification, gentrification, ‘touristification,’ property development, entertainment, etc. replaced the old paradigm of the industrial city, as a new, post-industrial economy emerged.

a historical logic and a kind of historical necessity to it. Chapter four of my *Worker Cooperatives and Revolution* fleshes out these ideas in more depth.

With everything that was happening—the aggressive public-opinion campaigns of the newly formed Business Roundtable, of the revitalized Chamber of Commerce and National Association of Manufacturers, the National Federation of Independent Business and scores of other trade associations, and the rightward shift of the media, etc.—it seems surprising that Carter was elected. But the trade issue—free trade (typically Democrats) vs. protectionism (often Republicans)—still divided business elites, and the economy briefly revived in 1975–76, so many pro-free trade multinational businessmen supported Carter in his presidential campaign. In the next few years, though, he was forced to move to the right on issue after issue—and even then he didn’t sufficiently please large sectors of business, which therefore finally abandoned the Democrats. Meanwhile, the economy went from bad to worse just as the 1980 election was approaching, and for budgetary reasons Carter made massive cuts in funds for the poor, blacks, and cities, and the Federal Reserve dramatically raised interest rates to curb inflation—which, of course, pushed the economy deeper into recession and was very bad for the Democrats’ mass base. Reagan was simultaneously moving from the far right to the center right, to be more electable. “Originally supported by ultraconservative entrepreneurs in California and elsewhere, some large fortunes inveterately hostile to the New Deal, parts of the armaments industry, many small businesses, and protectionist concerns in textiles and independent oil,” Reagan was now modifying his policy views to appeal to the rest of the business community. Crucially, his campaign sought a compromise on the GOP’s most divisive issue, international trade. The media, too, was largely behind him. All this added up to a solid victory for the Republicans in 1980.

Their victory, however, disguised the fact that their coalition was quite fragile. “Composed of both nationalists *and* several species of internationalists; advocates of tight money *and* monetary ease; free-traders *and* protectionists; sponsors of a variety of contradictory tax plans; and many clashing foreign-policy interests—the coalition that brought Reagan to power was a mile wide but only an inch deep.” To keep it together, the administration resorted to a very reliable stratagem: satisfy the greed of the rich. Of virtually *all* the rich. The history of the major tax reductions passed early in Reagan’s term doesn’t reflect well on the human species, so I won’t delve into it here. The point is that “in the golden glow of prospective tax reductions, and the drop in labor’s bargaining position that the rise in interest rates was already inducing, the Administration had at least for a time found a way to square the circle. While withdrawing from traditional government obligations to working people and the poor, deflating the world economy, and introducing massively regressive revisions of the federal tax system, it could reward virtually all members of its highly diverse and rivalrous business coalition by simply giving them streams of cash.”

Even as government revenues were being slashed by these tax cuts, an immense military buildup was being planned. Nearly the whole of American business was clamoring for it, largely to enhance the U.S.’s ability to project force abroad—“to press and defend American interests in an increasingly volatile world economy.” It was great for defense contractors, too. The hundreds of billions of dollars invested in weapons procurement, warhead production, military construction, and so forth was incredibly wasteful and redundant, but when one’s purpose is only to satisfy business and project power, considerations of efficiency are irrelevant. Billions of dollars were being cut in social spending at the same time, although many of the administrations’ proposals—e.g., to drastically “reform” Social Security—were beaten back in Congress. (Republicans tried to gut Social Security again under George W. Bush, but again they failed. Incidentally, Bill Clinton was eager to privatize the program in the late 1990s, but then he was impeached in connection with the Monica Lewinsky scandal and abandoned the idea in order to shore up his liberal base. Few people know of this major contribution that Lewinsky made to the welfare of Americans.)¹

¹ Michael D. Tanner, “Clinton Wanted Social Security Privatized,” *Cato Institute*, July 13, 2001; Robin Blackburn, “How Monica Lewinsky Saved Social Security,” *Counterpunch*, October 31, 2004. With the Lewinsky scandal unfolding and Clinton’s popularity eroding, “in an instant Clinton spun on the dime and became Social Security’s mighty champion, coining the slogan ‘Save Social Security First.’” This, after eighteen months of secretly preparing to privatize it. The man is a piece of work.

Nevertheless, cuts to Social Security did occur, along with major cuts to low-income benefits and jobs and services programs. “To take only a few examples: the reductions in Food Stamp benefits for some 20 million Americans hit the poor hardest, with 70 percent of the savings coming from families living below the poverty line; some 440,000 low-income working families (almost all headed by women) lost AFDC benefits, while several hundred thousand more had benefits reduced; Medicaid benefits, linked to AFDC, were therefore also scaled back, with the result that nearly a third of all children now living in poverty [in 1986] receive no Medicaid coverage; and as a direct result of cuts in low-income housing programs, an estimated 300,000 more families were pushed into substandard housing.” All these cuts did very little to reduce budget deficits, but at least they increased the misery of millions of people.¹

“By 1984 some 33 million Americans—one in seven—lived below the [absurdly low] poverty line, 4.4 million more than in 1980, and 9 million more than in 1978. The plight of children was worse. In 1984, about one-quarter of all children under the age of six lived below the poverty line, and more than half of all black children under the age of six lived in poverty.” Needless to say, the situation is worse now. With the poverty line at \$23,492 for a family of four—which is ridiculous; annually that’s barely enough money for two people, let alone four—about 50 million people were in poverty in 2013. Between 2009 and 2011, almost a third of the population was officially poor for at least two months.²

It’s so well-known that the Reagan administration dramatically slashed enforcement of social and environmental regulations, and of labor laws, that I won’t mention all the evidence. Unionization rates continued to plunge, too—to the point that private-sector unionization is now less than 7 percent. Overall, and all over the world, the 1980s were a horrifying decade. Unfortunately, the global spread of neoliberalism that began then has only accelerated.

What was the Democrats’ reaction to all these attacks on the domestic—and global—population? Much or most of the time, they supported and enabled them, wanting to regain business support. The party’s mass base, however, began to mobilize, despite having far too few resources to adequately counter the conservative offensive. Unions, community organizations, church groups, social-welfare workers, and state and municipal employees tried to unite in opposition to the cutbacks, and resistance grew to the administration’s arms buildup and savage policies in Central America. Incredibly, “even the AFL-CIO showed [meager] signs of life,” calling for rallies against the socially destructive policies. Reagan’s approval rating dropped from 68 percent in May 1981 to 35 percent in January 1983.

No matter. Business is the constituency that counts. Leading Democrats got together to reorganize the party’s finances and methods of fundraising, for example by creating the Democratic Business Council, which was successful at raising money from capital-intensive military contractors, investment bankers, real-estate magnates, high-tech executives, and corporate lawyers. The project to build a business-oriented alternative to Reaganomics quickly met with some success, given the discontent that Reagan’s bellicose foreign policy was causing in the multinational business community. Arms control became a popular issue among multinationalists and foundations that represented their interests, like the Rockefeller and Ford Foundations. Urban real-estate companies were also being alienated by Reagan’s policies, which were encouraging the flight of business from the Northeast and Midwest to the South and West, and tended to be destructive of the urban infrastructure necessary for the viability of many real-estate projects. These and other interests threatened by federal budget cuts—and favoring trade with the USSR, hence *détente* (which Reagan certainly didn’t favor)—coalesced around particular issues, such as the huge “nuclear freeze” movement. Nor was the explosion of government debt appreciated by, e.g., investment bankers or insurance companies, whose prosperity “depends on investor confidence in long-term bonds. Permanently growing deficits erode such confidence, since investors know that governments and taxpayers will be almost

¹ Some of the most important programs cut, aside from the ones just mentioned, were those in child nutrition, Supplemental Security Income, Low Income Energy Assistance, financial aid for needy students, health block grants and other health services, compensatory education, community-services block grants, general job-training programs, and public-service employment. And this was just in Reagan’s first term.

² Dave Boyer, *Washington Times*, January 7, 2014.

irresistibly tempted...to pay off the debt by printing money. Prominent members of both of these sectors [finance and insurance] thus became increasingly active in supporting the Democrats.”

One big problem for the Democrats was the trade issue. Since the flood of imports was costing many thousands of jobs, unions desperately needed a Democratic commitment to some degree of trade protection. But free-traders in the party were strongly against this. So what was to be done? As it turned out, the severe recession of 1981–82 was proving so damaging to many businesses that, by late 1982, they were ready to make concessions to other Democratic interests for the sake of challenging Reagan. And as we just saw, many other groups had their own grievances. So all these diverse constituencies were finally able to reach a compromise “industrial policy” plan in early 1983, and thus to come together, at least briefly, behind a Democratic presidential candidate for 1984, who turned out to be Walter Mondale.

Mondale’s campaign got support and funds from all the groups just mentioned, such as investment bankers, insurance executives, developers, and liberal internationalists. Before getting the party’s nomination, though, he had to deal with challengers from both his left and right. George McGovern, for instance, ran again, though the media and most of the business community still considered him basically representative of the class enemy and shut him out. Candidates on Mondale’s right, on the other hand, received a ton of money from business, much of which—given a more healthy economy than in late 1982—was now having second thoughts about the “industrial policy” compromise it had made earlier with organized labor. Since labor was obviously in decline, maybe it didn’t have to be reckoned with at all. Leading Democrats, and then the media and business community, in fact started to publicly criticize Mondale’s acceptance of the industrial policy as a capitulation to “special interests.” Later on, as it was amplified, this charge would prove deadly to his campaign. For now, though, with some difficulty he was able to defeat the business-beloved conservative Democrat John Glenn and the more liberal Gary Hart, and Jesse Jackson’s campaign—while generating a lot of excitement and publicity among the population because he was practically the only candidate addressing the concerns of the working class, the poor, and minorities—never had much of a chance, in light of elite hostility.

But Mondale made mistakes that cost him the general election. The worst was his suicidal pledge to raise taxes. “What on earth was he thinking?” you ask. Quite simply, he was thinking of his core constituency: those in the business community concerned about budget deficits. By supporting a tax rise he expressed his seriousness about getting the budget under control, and so could count on solid support from business. He also suicidally rejected the idea of broad tax reform, a popular issue that Reagan seized, probably because it made investment bankers and real estate interests nervous. But in taking these stances he ensured that the public would have little reason to vote for him. Certainly he didn’t excite labor, the poor, or minorities, since he tended to ignore them. Nor, despite his great efforts to court business, did he excite most of the rich, who frequently continued to favor and fund Reagan. And of course on election day Democrats suffered from their usual problem: huge parts of their mass base, alienated from a political system that ignored them, simply didn’t vote. Besides, as stated earlier, the upswing in the economy persuaded many among the middle class to stick with Reagan, who talked frequently about the attractive theme of economic growth. All these factors, and others I haven’t mentioned (such as Democrats’ ambivalence about spending millions of dollars to register new voters), combined to doom Mondale’s campaign.

The last chapter of the book contains a slew of insightful predictions, the most significant of which is that America will continue its right turn, because the popular opposition has too few resources. As we know now, that prediction was correct. With Bill Clinton, the new conservatism of the Democrats became irreversible—absent a mass movement that, even if it happens, still isn’t likely to turn things around anytime soon. The New Deal system and coalition is long dead and cannot be revived, in light of neoliberal globalization. My own prediction is that our current Gilded Age will continue to tear apart the social fabric until it calls forth a variety of popular movements and social upheavals that elites—globally—will have to reckon with somehow. We’re already seeing the first glimmers of this, though so far elites have been able to use simple repression to fight them off. But this strategy isn’t sustainable; constructive efforts to meet the resistance halfway are, sooner or later, inevitable, if only for the sake of preventing total social disintegration. Again, I refer you to my *Worker Cooperatives and Revolution* for more discussion of these

points. Briefly, I think we're in for a hundred-year-long chaotic transition to a new global system structured not around nation-states and corporate capitalism but some sort of more decentralized and fragmented political economy that can't be foreseen at present.

Anyway, the value of Ferguson and Rogers' book, and their way of analyzing politics, should be obvious. It's the Golden Rule: to find out who rules, follow the gold. In their last chapter they reiterate that it wasn't popular "special interests" that had caused the crisis the Democrats found themselves in; it was policies that elites had crafted in a context of sinking economic vitality. "These business interests [principally capital-intensive and multinationally oriented big business and its allies among developers, military contractors, and parts of the media]—and not workers, blacks, or the poor—were responsible for designing the fragmented, bureaucratized, litigation-prone regulatory programs and social-service delivery system whose costs ballooned in the 1970s. They promoted the vast urban-aid programs that were frequently little more than subsidies to developers, downtown merchants, and real-estate companies. Along with many Republican business groups, they pushed for the combination of regressive tax relief and a major military buildup that provoked [or rather helped provoke] the budget squeeze of the late 1970s and produced the even more disastrous one of the 1980s." It's the economic royalists of whom Roosevelt spoke who have transformed the country's politics since the 1970s—and who are digging the grave of capitalism by running society into the ground.

*

January–May, 2015

Reading parts of another book on John Mackie's moral skepticism, a collection of essays.

...I'm gonna have to stop with the ethics reading, at least for now. Have to focus on the dissertation.

[...] Need intellectual stimulation, which I can't get with the dissertation. Don't know if there's any point to it, but it's fun, so I'm reading Friedrich Lange's 1875 classic *History of Materialism* (three volumes).

In a footnote early on, Lange makes the interesting, though perhaps obvious, observation that materialism can lead straight into subjective idealism. You have the notion that the basic constituents of the world are material; then you have the (Lockean) notion, congenial to materialists, that the only way we know of material "things in themselves" is through our sense-perceptions, so that we don't have direct access to matter in itself; and then you can easily get the (Berkeleyan) position that we might as well discard the material things-in-themselves as unknown and unknowable. All we know, and all there are, are sensations and ideas in our mind. Apparently the Greeks never took this idealistic step. It's understandable why Berkeley took it, but of course in doing so he contradicted science and was quite wrong—and also made it a mystery as to how we could have these sensations and ideas in the first place. (In principle, materialistic science has little difficulty in explaining the origins of sense-perceptions—although it's true that the conceptual leap from neurobiological processes to subjective experience is a mystery.)

The change from the materialism of Democritus and, sort of, Protagoras and the Sophists to the anti-materialism of Plato and, in a different way, Aristotle was probably related to the suspicion that materialism, with its "sensationalism" (Protagoras's and Aristippos's emphasis on the particularity of sensations, an anti-universalist or -objectivist position), was democratic, populist, vulgar, etc. Or so it seems to me. Materialism had led to the relativism of Protagoras, the valorization of the individual as the measure of all things, with the idea that there was no objective truth but that only appearances mattered, such that the lowest person had access to as much truth as the "highest." And anyway, the Sophists seem to have been a rather democratic phenomenon, frowned on by conservative and older aristocratic types. Their very *dialectical* method, and their questioning, their cynicism, etc., bespoke hostility towards authority and tradition. Actually, in some respects Socrates himself must have belonged in spirit to this school—Aristophanes was right about that—given his irreverence, his radical doubt, and so on. Nietzsche saw this. ("With dialectics, the masses always end up on top.") It's kind of puzzling, then, that Plato so admired

Socrates, in light of Plato's radically anti-democratic instincts. In any case, Plato hated all this democratic nonsense, all this emphasis on flux and relativism and sensations and pleasure (Aristippos) and matter, so he undertook to prove it was all illusion, that only the timeless, the divine, the anti-material, the idealistic Forms were reality. It was sort of an intellectual version of authoritarian reaction. He hated the vulgar masses and so tried to convince himself that their world, their conceptions, they themselves were illusions, or botched manifestations of the Forms; he alone, with his beauty and goodness and truth and aristocratic consciousness, was real. Aristotle didn't go to these extremes, didn't feel such a need to deny the world he lived in, but did, nonetheless, look askance on democracy and the *hoi polloi*. Thus, he theorized a sort of compromise between materialism and idealism.

As for Socrates, Lange reminds me, in a later chapter, that despite having points of contact with the Sophists he was also opposed to them. And hence to the spirit of theoretical and practical materialism. He was conservative, a dogmatic moralist, interested in the universal truths of reason that explain the world, even religious in a monotheistic sort of way. He was temperamentally and intellectually opposed to mechanistic materialism, less interested in efficient causes than in final causes, *reasons* for why the world is as it is. Unlike the materialists, he was prone to anthropomorphizing. "His entire conviction is that the reason which has created the world-structure proceeds after the manner of human reason; that we can follow its thoughts everywhere, although we must at the same time admit its infinite superiority. The world is explained from man, not man from the universal laws of nature. ...Everywhere we have an anthropomorphic activity. A plan, a purpose must first be provided, and then the matter and the force to set it going. We see here how much of a Socratic Aristotle still was at bottom with his antithesis of form and matter, and the government of efficient causes by the final purpose." Socrates' was a basically theological conception. "The architect of the worlds must be a Person who can be conceived and imagined by man, though he may not be understood in all his actions." So, ironically, Socrates can be seen as inaugurating a (rationalistic) religious tendency that Plato carried forward and later the Neoplatonics and Christians filled out with different and more explicitly religious content.

—Paradoxical character, Socrates. Both democratic and anti-democratic, elitist and anti-elitist, conservative and radical, rationalistic and religious (fused together, as in fact has often been the case), etc. Seemingly skeptical of everything, but convinced that Truth existed and had only to be discovered (by means of dialectical criticism, rigorous criticism of one's conventional beliefs, the discovery of proper and timeless *definitions* of things).

Aristotle, of course, had no patience for the mechanistic materialism of Democritus and others. *Teleology* is kind of the opposite of mechanism. But it's an understandable and tempting extension of human intention to nature, which does, after all, at first glance seem to exhibit *design*. Ultimately Aristotle was led to "a pantheistic theory, which makes the divine thought everywhere permeate matter, and realize itself and become immanent in the growth and becoming of all things." Matter is passive, form is active; and the movement towards form animates all matter. But this movement is an expression of the unmoved mover, God. So God is everywhere, so to speak. —And yet he is also transcendental, so I wouldn't say it's a strict pantheism.

Anyway, decades after Aristotle, the pendulum swung again, back to materialism. This was especially so with Epicurus, but also with the Stoics and others. "The historical circumstances which prepared the way for the new influence were the destruction of Greek freedom [by the Macedonians] and the collapse of Hellenic life..." The Platonic state and Aristotle's politics had been opposed to individualism, but now, in the third century B.C., "individualism was of the essence of the time, and an entirely different stamp of men arose to take control of the thought of the age." Scientific research became more pronounced again, etc.

The practical standpoint which Socrates had asserted in philosophy allied itself now with individualism, only to become the more one-sided in consequence. For the supports which religion and public life had previously offered to the consciousness of the individual now completely gave way, and the isolated soul sought its only support in philosophy. So it came about that even the materialism of this epoch, closely as it also, in the contemplation

of nature, leaned upon Democritus, issued chiefly in an ethical aim—in the liberation of the spirit from doubt and anxiety, and the attaining of a calm and cheerful peacefulness of soul. [Epicureanism.]

Lange is worth quoting on Stoicism:

At the first glance we might suppose that there is no more consistent materialism than that of the Stoics, who explain all reality to consist in bodies. God and the human soul, virtues and emotions, are *bodies*. There can be no flatter contradiction than that between Plato and the Stoics. He teaches that that man is just who participates in the idea of justice; while, according to the Stoics, he must have the substance of *justice* in his body.

This sounds materialistic enough; and yet, at the same time, the distinctive feature of materialism is here wanting—the purely material nature of matter; the origination of all phenomena, including those of adaptation and spirit, through movements of matter according to universal laws of motion.

The matter of the Stoics possesses the most various forces, and it is at bottom force that makes it what it is in each particular case. The force of all forces, however, is the deity which permeates and moves the whole universe with its influence. Thus deity and undetermined matter stand opposed to each other, as in the Aristotelian system the highest form, the highest energy, and the mere potentiality of becoming everything that form produces from it—that is, God and matter. The Stoics, indeed, have no transcendental God, and no soul absolutely independent of body; yet their matter is thoroughly pervaded, and not merely influenced, by soul; their God is identical with the world, and yet he is more than mere self-moving matter; he is the “fiery reason of the world,” and this reason works that which is reasonable and purposeful, like the “reason-stuff” of Diogenes of Apollonia, according to laws which man gathers from his consciousness, and not from his observation of sensible objects. Anthropomorphism, therefore, teleology, and optimism profoundly dominate the Stoic system, and its true character must be described as “pantheistic.”

Etc.

It was left to Epicurus to revive mechanistic materialism. I won't say anything about him, except that his whole system is subordinated to the goal to free people from suffering, from fear and anxiety. The point of studying nature is to free yourself from fear and anxiety, a goal that is attained as soon as you show how events can be explained from universal natural laws rather than supernatural causes (presumably because that shows their necessity and makes them comprehensible to human reason—and also frees us from our terror of the gods, and from the destructive irrationalities of religion). –Atheism is liberating! (Epicurus probably wasn't literally an atheist, but, given his conception of the gods, he was something like it).

Again, there are many points of contact between Epicureanism, Stoicism, and major tendencies of Indian thought.

The great age of Greek speculative philosophy came to an end with Epicurus. But advances continued in other fields, such as geometry, astronomy, anatomy, medicine, the study of grammar, history, and philology. We moderns tend to denigrate the achievements of the ancients in science, but the Hellenic and Hellenistic truly were astonishing eras. They saw the birth of the essential scientific notion that the world is a natural unity governed by universal laws. Doubtless that wasn't always clearly perceived, and few such laws were discovered then in comparison with the modern age, but it was at least a decisive advance. –Ironically, however, few of the great ancient “scientists” belonged to materialistic schools of philosophy. Not the mathematicians, for instance; and not Galen, Pliny, or Ptolemy, who inclined to pantheism. An odd fact.

So, on to the Romans. For a long time they weren't at all inclined to materialism, even in its practical aspect: they were a martial people, hard and cruel, not luxurious and wanton, nor given to scientific

and philosophical speculation. But this had to some extent changed by the end of the Republic, when decadence was setting in. Stoicism and Epicureanism, usually in vulgarized and diluted forms, colonized the Roman mind. The least vulgar or diluted expression of Epicureanism was in Lucretius's famous poem *De Rerum Natura*, which Lange discusses at length, and which was still delighting materialists in the eighteenth century. —In fact, Lange remarks that “it is only in our days [the 1860s, etc.] that, for the first time, materialism seems to have broken completely away from the old traditions.” A striking observation. The eighteenth century, after all, was still steeped in the forms and content of the classical world; only in the nineteenth century was all that stuff *finally*, in large measure, left behind. And yet not entirely: the weight of antiquity was still felt—though less so than before—in some aspects of culture and education even into the first half of the twentieth century! It's amazing that it wasn't until my dad's generation that classical memories and identities were decisively discarded, except from a few dusty corners of academia. —Observe the remarkable continuities of history! “The past isn't dead; it isn't even past.” Marxism: the incubus of history weighing on the brains of the living.

Materialism of course didn't have much of a chance in Christian Europe, which was more hostile to it than Islam and the Arab civilization. Even in philosophy, first Neoplatonism and then Aristotelianism reigned. Lange has a thoughtful critique of Aristotelianism, particularly of how its notions of form and matter, actuality and potentiality, substance and accident, etc. are merely subjective projections—mental constructs—and do not exist objectively in the things themselves, and therefore lead us astray when we take them to be objectively valid and do *not* help us comprehend the in-itself nature of the world, but I'll skip over that. It's worth pointing out, though, that Aristotle's depreciation of matter as passive and so forth contributed in its own way, even up to early modern times, to impeding any acceptance of materialism. For instance, how is a “dark, inert, rigid, and absolutely passive substance” to *think*, as it must on a truly materialist conception of the world? So these legacies of Aristotelianism had to be overcome.

It took hundreds of years, but they were. From the fourteenth to the seventeenth centuries, a galaxy of European thinkers and artists and (proto-)scientists slowly and usually unconsciously laid the groundwork for a transcendence of Aristotelianism and of the anti-materialist dogmas of the Church. The Humanists, the warriors of the Reformation, even some of the late Scholastics, and of course scores of sixteenth-century scientists and philosophers, all paved the way for the reappearance of materialism and with it modern science. Giordano Bruno, for example, under the influence of Copernicus, in the late sixteenth century undertook a “revaluation” of that much-maligned category *matter*, proclaiming it to be active and to contain everything within itself. “Matter is not without forms—nay, it contains them all, and since it unfolds what it carries concealed within itself, it is in truth all nature and the mother of all living things.” But Bruno was still pantheistic. Francis Bacon was *almost* a complete materialist: e.g., “among all philosophical systems, Bacon places that of Democritus highest. He asserts in his praise that his school had penetrated deeper than any other into the nature of things. The study of matter in its manifold transformations carries us farther [Bacon argues] than Abstraction. Without the assumption of atoms nature cannot be well explained. Whether final causes operate in nature cannot be definitely decided; at all events, the inquirer must confine himself efficient causes only.” But on important points he was equivocal, and he concentrated almost exclusively on method, so Lange refrains from calling him the true restorer of materialism. He was influenced by an environment saturated with alchemy and astrology, which, with their spirits and sympathies and antipathies and whatnot, were anything but mechanistically materialist.

Still, Bacon did help bring about modern science, by his emphasis on data collection and induction. As we know, he was the inductive empiricist, Descartes the deductive rationalist. Both contributed to science. But there's an irony here: while in its essential points materialism really starts from Bacon, it takes its *mechanistic*, or *mechanical*, character largely from Descartes, who—as I've learned from Chomsky—used the idea of mechanism (e.g., an old clock) to distinguish the material world from the human mind, the realm of freedom that isn't governed by the laws of mechanics. So, even though metaphysically and epistemologically Descartes started from his *cogito ergo sum*, doubting the existence of the external world, a position that can easily lead into idealism—and, furthermore, even though he believed in an immaterial substance, namely the soul—he gave the materialism of the eighteenth century

one of its defining characteristics (although really, perhaps, this definitive conception goes back to Democritus).

With his *ad hoc* “God wouldn’t deceive me, so there must be a world,” Descartes escaped idealism and was able to investigate nature. He wasn’t strictly an atomist, though: he thought matter was infinitely divisible, since however small you get you can always imagine another division. And, unlike most or all true atomists, he denied that a vacuum could exist in nature. Still, he was extremely close to atomism: “he substitutes for the atoms small round corpuscles, which remain in fact quite as unchanged as the atoms, and are only divisible in thought, that is, potentially...” Hm. So, as opposed to atoms, there are corpuscles. That strikes me as hair-splitting. Anyway, he set aside all mystical explanations of nature by explaining every natural phenomenon by the laws of mechanical impact. Plants and animals and everything else—except, in part, humans, who have free will—are essentially *machines*. Again, I’ve learned from Chomsky where this story is headed: Newton demonstrated that the laws of mechanics are not enough to explain the world, for his system requires the incomprehensible *action-at-a-distance*; and with this move, strictly mechanistic/mechanical materialism, just a few decades after its rebirth, collapsed again forever. Now all kinds of “occult” things were admitted into science and the external world: forces, action at a distance, eventually magnetic fields and whatnot, then the paradoxes of general relativity and finally quantum mechanics. Pure clock-like contact physics is infinitely more primitive than all this...and yet, of course, all this remains materialism, and even, loosely speaking, “mechanistic” materialism, in that no Intelligence is behind it, no design. And the only thing that is now seen as existing is—*matter*. Matter/energy is everything in the universe. Thus, pure materialism has completely triumphed after a long history of being held back and despised, notwithstanding Democritus, Leucippus, and Epicurus, and, in ancient India, the Charvaka school of philosophy. –How fascinating and ironic history is!

To continue: Lange, perhaps eccentrically, gives credit for the revival of materialism to Pierre Gassendi first and foremost. Gassendi resurrected Epicurus, and so spread the doctrine of atomism, which later, in modified forms, had such success. But of course *Hobbes* is more famous as a self-conscious materialist, and ultimately was surely more important (or so it seems to me). He proposed an all-encompassing philosophy of materialism that was so influential I needn’t discuss it. But apparently he wasn’t an atomist, unlike Gassendi and most other materialists.

Needless to say, the progress of materialism was, in the final analysis, a product of the development of mercantile and then industrial capitalism. England and France were its main homes in the eighteenth century. As a philosophy, it was used mostly in a negative way in France, to criticize the Church and superstition and irrational traditions; it was more positive and, perhaps, sophisticated in England, especially as it flowered in the sciences. Robert Boyle and Isaac Newton are the two great early names there. Boyle was more important than is often thought, for instance in rejecting alchemy (unlike Newton) and all vestiges of Aristotelianism, and in introducing materialistic foundations into science. He was a rigorous experimenter and dedicated sharer of data and ideas with his colleagues, practices that were essential to advancing science. He and Newton were much influenced by Gassendi’s Epicureanism, and so, like nearly all the moderns, were atomists, though they rejected (again, like most or all the moderns) the absolute indivisibility of the atoms. (If God created atoms he must be able to divide them.) Lange goes on to discuss Newton’s inadvertent invalidation of traditional mechanical materialism. I’ll just quote the following paragraph:

From the triumph of Newton’s purely mathematical achievement there was curiously developed a new physics. Let us carefully observe that a purely mathematical connection between two phenomena, such as the fall of bodies and the motion of the moon, could only lead to [Newton’s] great generalization [as regards gravity] in so far as there was presupposed a common and everywhere operative material cause of the phenomena. The course of history has eliminated this unknown material cause, and has placed the mathematical law itself in the rank of physical causes. The collision of the atoms shifted into an idea of unity, which as such rules the world without any material mediation. What Newton held to be so great an absurdity that no philosophic thinker could light upon it, is

prized by posterity as Newton's great discovery of the harmony of the universe! and, rightly understood, it is his discovery, for this harmony is one and the same, whether it is brought about by a subtle matter, penetrating everywhere and obeying the laws of collision, or whether the particles of matter regulate their movements in accordance with the mathematical law without any material intervention. If in this later case we wish to get rid of the absurdity, we must get rid of the idea that anything acts where it is not; that is, the whole conception of the mutual influence of the atoms falls away as an anthropomorphism, and even the conception of causality must assume an abstracter shape.

He surely goes too far in rejecting the idea of the mutual influence of atoms; for they do influence each other, only not in mechanical ways. Incidentally, instantaneous action at a distance is, indeed, absurd and physically impossible, since Einstein showed that nothing can travel faster than the speed of light. So Newton's doubts were right, though he was wrong to think—if he did—that the mere unintelligibility of some idea to the human mind is enough to refute that idea. Anyway, the point is that action at a distance, unmediated by anything, *doesn't*, after all, exist, for electromagnetic fields and the curvature of space-time (to explain gravity) have been postulated as “mediators.” Insofar as Chomsky—and Lange—tends to imply that unmediated action at a distance is integral to modern physics, he's wrong.

After a short discussion of Locke's empiricism (“sensationalism”), Lange proceeds to the eighteenth century. Disjointed notes: David Hartley in 1749 “undertakes to refer the whole of human thought and sensation to vibrations in the brain.” Not really original, but important even so, and despite Hartley's religious timidity. He's disturbed by the contradiction between the *causal necessity* of the brain's functions—material laws, etc.—and the apparent *freedom* of thought. (Yup, it's a paradox, an unresolvable one. You have the self, choice, intentionality, and reason versus the non-self, determinism, and “mechanistic” causation.) And there's Joseph Priestley, whom Chomsky likes to reference. I'll skip over the little that Lange says about Shaftesbury, Voltaire, Diderot, and Robinet. Germany for a long time was philosophically very backward compared to England and France, remaining “the ancestral home of pedantic Scholasticism.” But near the end of the seventeenth century, Cartesianism and Spinozism became more influential there in the struggle against Scholasticism and theological orthodoxy. The English influence of Hobbes was felt around the same time as well, and so materialism slowly spread.

According to Lange, the true originator of materialism in France, and its most radical exponent—“scandalously” radical—was La Mettrie. He influenced all the other famous *philosophes*, though they disowned him as being too radical. His main point was that man is a machine, and—contrary to Descartes—not qualitatively different from other animals. In many ways, he is actually inferior to them. Matter has the capacity for sensation. All things soulful and spiritual and noble are grounded in the operations of base matter. (Compare Nietzsche.) Man is not special in his consciousness of good and evil; other animals have this also, as shown, e.g., by the downcast behavior of a pet dog after biting its master. An ape could probably be taught to speak. “The moral law is, in fact, still present even in those persons who, from a morbid impulse, steal, murder, or in fierce hunger devour their nearest relatives. These unhappy creatures, who are sufficiently punished by their remorse, should be handed over to the doctors, instead of being burned or buried alive, as has been the practice.” Wow, what scandalous, horrible opinions! La Mettrie even anticipates Rousseau by arguing that humans are created to be *happy*, not to be *learned* (sophisticated), which amounts to a kind of misuse of our talents.

On religion: “The existence of a Supreme Being La Mettrie will not doubt [or so he says, in his book *L'Homme Machine*, published in 1748]; all probability speaks for it; but this Existence no more proves the necessity of worship than any other existence: it is a theoretical truth without any use in practice; and as it has been shown by innumerable examples that religion does not bring morality with it, so we may conclude that even Atheism does not exclude it.

“For our peace of mind it is indifferent to know whether there is a God or not, whether he created matter, or whether it is eternal. What folly to trouble ourselves about things the knowledge of which is impossible, and which, even if we knew them, would not make us a bit happier!” He rejects the argument-from-design for God's existence, because, after all, we know so little about nature that it's silly to make

dogmatic claims like that only God could create such a beautiful world. He thinks an atheistic world would be much happier than the current religious world, because there would be no theological wars, no soldiers of religion, and humans would be pure and innocent again. “Men would follow their own individual impulses, and these impulses alone can lead them to happiness along the pleasant path of virtue.” Again, Rousseau. As for immortality, La Mettrie says it may be possible, given our ignorance of nature.

So, the whole thrust of his philosophy is that we should always rely on experience and observation, not religious authority or metaphysical speculation. *A posteriori*, not *a priori*. We should follow the practice of physicians, not philosophers. (Again, Nietzsche.) “One can and one even ought to admire all these fine geniuses in their most useless works, such men as Descartes, Malebranche, Leibniz, Wolff and the rest, but what profit, I ask, has any one gained from their profound meditations, and from all their works?” *Body* is the key to life, bodily processes, bodily desires and appetites; all things intellectual and spiritual originate in things bodily. The soul is nothing but imagination, or “material consciousness,” as Lange paraphrases. Or, to quote La Mettrie in another place, “The soul is nothing but an empty word, of which no one has any idea, and which an enlightened man should use only to signify the part in us that thinks. Given the least principle of motion, animated bodies will have all that is necessary for moving, feeling, thinking, repenting, or in a word for conducting themselves in the physical realm, and in the moral realm which depends upon it.” *L’Homme Machine*, which I just read on the internet, is an incredibly modern work, and incredibly Nietzschean in many respects. Truly brilliant and revolutionary, even epoch-making.

Not surprisingly, it was read all over Europe. And it was reviled. Its author was even more reviled after, in another work, he praised sensuous pleasure. As Lange paraphrases, “Reflection may heighten pleasure, but cannot afford it. He who is happy through it has a higher happiness, but more frequently it destroys happiness. [True.] ...The intoxication of opium produces by physical means a happier frame of mind than any philosophical treatise. How happy a man would be who all through his life could enjoy a frame of mind as this intoxication transiently procures him! ...Intellect, knowledge, and reason...are a superfluous adornment with which the soul can dispense, and the great mass of mankind, who actually do dispense with them, are not thereby shut out from happiness.” Actually, “reason is not in itself hostile to happiness, but only through the prejudices that attach themselves to thought.” Again, true. In its proper and healthy activity, reason augments happiness. La Mettrie also praises education as a contributor to happiness. From this eudaemonistic foundation he erects a notion of virtue: “He agrees with Hobbes in holding that there is no such thing as virtue in an absolute sense, that anything can be called good or bad only relatively—in relation, in fact, to society. Instead of the absolute command by the will of ‘Leviathan,’ however, we have the free judgment of the individual as to the good and evil of society...” It seems that he arrives at a sort of early utilitarianism, which was later worked out by Helvetius. And then reproduced by Bentham in his dull way. “The whole distinction between the good and the bad,” as Lange says, “consists in this, that with the former, public outweigh private interests, while the contrary is the case with the latter.” La Mettrie also mentions the principle of *sympathy*, “the most important principle upon which [a materialist ethic] can depend.” At the same time, he is akin to La Rochefoucauld (and other later writers) in recognizing the importance and value of self-love. At times he even goes out of his way to exalt sexual pleasure, apparently in order to scandalize society. —I love this guy! I’ll have to read some of his other works too.

In France, the chief home of philosophical materialism in the second half of the eighteenth century, all these materialist currents culminated in d’Holbach’s great *Système de la Nature*, published in 1770. “In the *System of Nature*,” says Lange, “we feel already the cutting blast of the [French] Revolution.” No wonder it so stirred up French society. It was atheistic, materialistic, deterministic, empiricist(ic), and radical in every respect. All is matter and motion. Religion is the chief source of human corruption. Etc. All or most of its ideas are basically implicit in La Mettrie. [I suppose Jonathan Israel would say they really come from Spinoza, who, allegedly, was the main progenitor of all these tendencies.]

A German reaction against materialism occurred with Leibniz and his successors, such as Wolff. The conception of the monads—which I’ve never understood, and which seems utterly bizarre—obviously bears the imprint of atomism, but its “atoms” are immaterial in some way or other. Each of them has consciousness to a greater or lesser degree, so that we no longer have to ask, with the materialists, “How are sensations and consciousness possible if material atoms are the basic stuff of the universe?” Leibniz’s

monads are not material, or they're somehow a fusion of material and immaterial (I don't know), and they have consciousness. So, okay, no more mind-body problem! We've solved it; simple as that! Anyway, Leibniz's system didn't seem to have the radical consequences of materialism—especially since it was “optimistic,” implying that this is the best of all possible worlds—so it became popular with conservatives and the like. Later, many Germans shared in the European reaction against La Mettrie and other militant materialists;—State and Church, of course, were no friends of materialism. In fact, despite empiricism and the progress of science and materialism, the eighteenth century was full of an idealist impulse—idealist in a broad sense. For example, interpretations of politics and social oppression were typically idealistic, focused on intellectual error and ignorance, religion, the conspiracies of priests, etc. A pronounced naiveté suffused the Enlightenment, which in addition was enamored of the ideals of beauty and justice. And in Germany, an idealistic, nationalistic, ultimately romantic movement—*Sturm und Drang*, etc.—rose up in (partial) reaction against materialistic dogmas and aridness.

And then, of course, appeared Kant and decades of German idealism. England and France had left the field of philosophy open to Germany, while they embarked on adventures in the economic and political spheres. So philosophical idealism reigned—as did romantic idealism in politics (together with conservatism, and eventually liberalism, among the rulers), especially on the continent, until 1848—even as economic and scientific materialism were advancing in England and France. It was a time of paradoxes, collisions between old and new, real and ideal, revolution and reaction, and very divided ideologies. Confusion and ferment. Lange doesn't discuss all this; instead he spends a lot of time on Kant, whom he considers exceptionally important for the history of materialism. Kant was neither a materialist nor an idealist with respect to the thing-in-itself; he thought that none of our conceptions or categories can apply to it. So, Lange says, insofar as materialistic science is supposed to describe the thing-in-itself, it's thrown out the window by Kant's system (which Lange substantially agrees with). —This is silliness, by the way. Maybe our ordinary notions/intuitions of matter, space, time, and, possibly, even causality don't apply to the most elemental level of nature or the “thing-in-itself” (or so you'd think from quantum mechanics and modern physics in general), but we can still postulate intelligible theories about it and invoke strange, unconceptualizable entities like electrons and quarks and photons to explain it. Besides, the old question remains: how can you explain the success of science except from the perspective of scientific realism? It's just stupid to deny that the world-in-itself is at least partly captured by modern science. Nor, in fact, does modern science contradict a sort of neo-Kantian viewpoint, as I've always insisted. It actually *confirms* a neo-Kantian rationalism—so much so that you have only to “naturalize” or “biologize” Kant (and other rationalists) in order to get modern science. (The nervous system constructs experience, etc.)

Lange spends a long time defending the idea of the synthetic *a priori*, but I won't get into that. It's obvious. Insofar as mathematics, for example, is not deducible from the principle of contradiction, it's “synthetic.” In fact, we constantly rely on *intuition* in geometry and arithmetic, the intuition of spatial forms and so on. And a mental act of synthesis occurs when we construct a new number out of several other ones. On a deeper level, the brain “synthesizes” everything we experience, which causes us to unconsciously apply to experience—or rather, structure experience according to—a huge array of “*a priori*” categories, computations, constructions, fundamental spatial, temporal, logical, linguistic, emotional, aesthetic, etc. principles. I've never understood the *point* of the controversy, which is to say the point of empiricist objections to this confirmed-by-modern-science rationalism.

As for Kant's convoluted speculations on sense and the understanding, on the derivation of the categories (the “transcendental deduction”), etc.: while interesting, they can surely be discarded. They're superseded by cognitive psychology and other fields of science. Metaphysics itself has been substantially taken over by science. All the old metaphysical and psychological speculations of the philosophers might be worth reading and periodically might be suggestive, but on the whole they're of little value compared to science and modern empirical methods. (The psychological speculations are usually of greater value than the metaphysical, i.e., pseudo-scientific, speculations.)

If you know Marx, you know that it was with Feuerbach, in the 1830s and 1840s, that philosophical materialism was reborn after the era of German idealism. And yet even Feuerbach, despite his anti-religion and his anti-Hegelianism, could not escape idealism completely, for he tends to place man at the center of

things. There is also a sort of romanticism in him, with his elevation of love and recognition, the I–Thou relation, and his sometimes rhapsodic prose. “Isolation is finiteness and limitation, community is freedom and infinity. Man by himself is but man; man with man, the unity of I and Thou, is God.” And so forth. In fact, as you know, Hegel still continued to influence the youth in the early 1840s, particularly the Young Hegelians. But the temper of the time, even among some of the Young Hegelians, was moving towards materialism. Lange doesn’t mention this, but it’s most obvious with Marx. The beginnings of industry were coming to Germany, and chemistry, and physiology. Religion was criticized and attacked, as with David Strauss’s *Life of Jesus*. Then the explosion of 1848 happened—but here, still, idealism and romanticism were prominent. The *Communist Manifesto* was ahead of its time. Industry and science continued progressing in the 1850s and later, and a few forgotten German thinkers (like Karl Vogt, whom Marxists know of only because of Marx’s bitter contempt for him) defended materialism in philosophy, and the old idealistic romanticism finally died—although a new sort of reactionary-idealistic German nationalism was born. And we know what that ultimately led to: world wars and Nazism. It’s interesting how—all over Europe—an extreme practical and scientific materialism could, under the influence of imperialism, ally with a sort of ultra-idealistic, albeit horrendously reactionary, nationalism, of course in the service of industrial capitalism and each nation’s ruling class. Materialism (of various kinds) had at last attained total confidence and power, but it needed to subsidize and spread a type of fascist idealism in order to continue accumulating power and suppressing working-class dissent.

Anyway, my patience with Lange’s verbosity and repetitiveness is wearing thin, especially since for the rest of the book—hundreds of pages—he discusses dated nineteenth-century science and philosophical speculations, adding a good many of his own. I don’t feel like digesting and regurgitating all this verbiage. The book is too long anyway, especially as Lange now delves into “Darwinism and Teleology,” “Brain and Soul,” “Scientific Psychology,” “The Senses and the World,” “Political Economy and Egoism,” “Christianity and Enlightenment,” etc. Throughout much of this runs his unconvincing polemic against materialism. So, we’re done.

Except for one last thought. In the social and political sense, it’s true that modern society is more “materialistic” than earlier societies. But we shouldn’t forget the lesson of Marxism, that ultimately all societies are structured according to economic power dynamics, classes, methods of production and the unequal distribution of material resources, a distribution that largely determines what sorts of ideas will predominate in a given society (because one needs resources in order to propagate ideas—and so “the ideas of the ruling class [which has the most resources] will in every epoch be the ruling ideas”). One can understand history only on materialist premises. In this respect, the social sciences are indeed somewhat parallel to the natural sciences. Whether in philosophy, science, or social science, idealism is wrong.

Sent Chomsky another email about the old idealists, because I wanted to state my case as clearly as possible:

For a long time I've been bothered by the idea that I have to choose between two options: either philosophical idealists have been radically confused, or I radically misunderstand them. Neither option I find particularly satisfying, but I've been a bit more attracted to the first. In brief: when Berkeley or Schopenhauer or whoever says that he accepts natural science, but at the same time that there is no mind-independent matter, that the world exists solely in consciousness, so to speak, it seems to me that he is blatantly contradicting himself. For science explains the phenomena that we experience in consciousness by postulating material processes that are supposed to be occurring external to consciousness, i.e., without consciousness's being aware of them as they're happening. Digestion is going on 'mind-independently.' And it's a material process. So: every scientific hypothesis is *transparently, obviously* premised on the notion that matter-external-to-consciousness exists. (And of course, in addition, the success of science is inexplicable except by presupposing scientific realism.) This seems to me so obvious, so necessarily clear to even

an eight-year-old, that I'm bewildered as to how philosophers could fail to see it. Am I somehow misunderstanding them?

I'd say something similar about the logical positivists, incidentally. They wanted to avoid metaphysical questions as being meaningless—questions like whether there is a 'world-in-itself,' a world of matter external to mind—somehow failing to see that when science describes, e.g., mechanisms internal to the brain, it is assuming that *there is a brain*, which is to say a piece of matter 'external' to mind. A piece of matter that, in fact, gives rise to mind. Lenin ridiculed Mach and others' "brainless philosophy" in *Materialism and Empirio-Criticism*, and I have to admit I sympathized with his frustration when reading it. For it seemed clear to me that Mach and his logical positivist disciples were, despite themselves, effectively idealists (in their instrumentalism, etc.). In any case, thinkers like Carnap, who were in some respects very acute, should have seen that one cannot avoid "metaphysical" questions like whether matter exists (external to mind). It's either Yes or No, not "the question is meaningless." If Yes, science—the search for causes in the external world—is possible. If No, science is not possible. —But evidently it is possible, so the answer has to be Yes.

Does this seem like approximately the right picture, or am I underestimating all these anti-realists?

He answered, "It's possible to hold, consistently, that we can be confident only of our immediate experience/impressions, that science is our effort to try to account for them, and that contemporary science is our best guess—but without going beyond that to claim that the entities postulated are more than explanatory fictions. —I'm not advocating that, but it's a consistent position."

Sent him another email after I'd asked if I could post the exchange on academia.edu. He said only if I kept it anonymous, because he doesn't like having personal correspondence posted publicly, to which I replied he must have found it annoying when the journalist George Monbiot posted a bunch of emails they'd sent each other. So he wrote, "True. I found it not only annoying but morally grotesque. Enough so that I'd never write anything to him again. It's a norm of civilized behavior that one asks permission to publicize personal correspondence." So, deciding to plunge into something I've always wanted to ask him, sent this:

I won't take advantage of your generosity by continuing to email you, but just one last time. Given your acute sense of moral rectitude, it's often struck me that there's a sort of inconsistency, albeit an attractive and necessary one, in your behavior. But in fact we're all inconsistent in this way. Namely, we condemn people with whom we have no personal connection for their periodic violations of moral and intellectual standards, even as we're very forgiving of family members and friends who display the same or similar faults. (In fact, we ourselves frequently display the same faults we accuse others of—as you constantly remind your audiences.) That's part of what *loyalty* means, of course, but it remains a (to me) bothersome inconsistency regardless. Criticizing or 'condemning' others, as I sometimes do, while knowing that people close to me, and in some cases I myself, are or could be guilty of the same thing. That knowledge makes it hard for me to take any of my judgments of people seriously.

To say it differently: you, who have higher intellectual and moral standards than most, must frequently be disappointed in your friends' behavior, because people one respects or is friends with sometimes do morally grotesque things—as when (to take a random example) Jesse Lemisch, whom I respect, tells a group of people (at a conference) of various unsavory opinions an academic expressed to him in private correspondence. Or when Howard Zinn—according to something I read, maybe untrue—cheats on his wife.

Etc. You're very loyal, as Finkelstein said once in an interview, and you consistently express idealism about 'ordinary people' (which, needless to say, is the proper thing to do, just from the moral perspective), but I can only imagine it's been sort of a burden for you to be aware of the frailties of people close to you, and of people in general.

Maybe the point is that one can condemn the acts without necessarily condemning the person who commits them. Certain acts are morally grotesque, but one can still respect and value people who occasionally have lapses. Because, after all, everyone has lapses from time to time. –Still, I remain bothered by the inconsistency of being infinitely more forgiving of people I'm close to than of others. But I guess this inconsistency is just a necessary, and even an important, part of life.

—Anyway, that's something I've wanted to say for a while, because of the contrast between your severe moral consciousness (and expressed idealism about humans) and the morally/intellectually fuzzy behavior of most people.

I don't know how one can respond to this email. So don't worry about it; you're too busy anyway.

He replied, “You’re probably right, but I think it’s an understandable flaw.”

Reading the book that was all over the media a few months ago, *The Half Has Never Been Told: Slavery and the Making of American Capitalism*, by Edward Baptist. It’s masterful.

Published an article in *CounterPunch*:

The Government's Intelligent Design

The public debate over government surveillance that was, if not inaugurated, at least intensified by the publication of documents provided by Edward Snowden has been, in some respects, surreal and deluded. One side claims that the NSA's mass surveillance is necessary to protect the public from terrorism, that in fact it has thwarted many "potential terrorist events." The other side claims, with much more justification, that bulk data collection does little or nothing to protect ordinary civilians. But few commentators draw another, more subversive conclusion: *government has no interest in protecting its citizens (as such) in the first place*. In fact, its interest is precisely the opposite: *to expose its citizens--with privileged exceptions--to harm*.

Sounds absurd, of course. But consider, first, the recent historical record, which certainly does not support the idea that the U.S. government cares about protecting Americans. Exhibit A is the attacks of 9/11. It became a commonplace long ago for leftists and liberals to cite the White House memo of August 6, 2001 that bore the heading "Bin Laden Determined to Strike in U.S.," which was apparently ignored at the time by the Bush administration. Perhaps more damning is Lawrence Wright's 2006 book *The Looming Tower*, which made it abundantly clear that the CIA and the FBI had not prioritized the fight against terrorism even after the 1993 Twin Tower bombing and the 1995 Oklahoma City bombing. If one were malicious enough, one might attribute competence to government institutions rather than mere criminal bungling: perhaps the ridiculously counterproductive--from the perspective of thwarting terrorism--organization and efforts of the CIA and FBI before 9/11 were, by some twisted institutional logic, *designed* to make possible precisely what happened, a major terrorist event.

Another commonplace is the observation that George W. Bush's Iraq war, far from mitigating terrorism, increased it substantially, perhaps sevenfold. This was predictable and predicted in 2003, a fact that, by elementary logic, means that the Bush administration at the very least was perfectly happy to expose American (and of course foreign) civilians to greater threats. The same logic applies to Obama's global drone war, which apparently has killed 50 civilians for every 1 terrorist.

Not surprisingly, it has fueled terrorism, and thus increased threats to Americans. (In fact, the drone campaign itself is terrorism, but here I am confining myself to the conventional American understanding of the word, as applying only to people that the U.S. government doesn't like.)

One could go on listing such facts indefinitely. For instance, the sordid lesson to draw from the Hurricane Katrina debacle in 2005 is that protecting Americans from a natural disaster was not a priority of government at any level, at least not of the governments involved. The deplorable actions of police in the hurricane's aftermath confirm this conclusion. The victims were treated as criminals, not people who needed and deserved protection.

In addition to ample historical evidence, one can also consider simple logic. Returning to the NSA's mass surveillance, it shouldn't be hard for government officials to comprehend that the more time and resources they devote to monitoring ordinary civilians, the less time and resources they are devoting to monitoring plausible terrorist threats. In fact, almost every major terrorist attack in the West during the past fifteen years has been committed by people who were already known to law enforcement. Such was the case, for instance, with regard to one of the brothers accused of the 2013 Boston marathon bombings. But the government, obligingly, was too busy spying on ordinary Americans to pay much attention to him, so he was able to carry out his attack unhindered.

But why, you ask, would it be in the interest of government to expose the public to harm? This question cannot be answered except in the context of specific historical circumstances, in this case the circumstances of neoliberal capitalism. In a society that is experiencing stratospheric income inequality, high unemployment and long-term economic stagnation, retrenchment of social welfare programs, the reality and threat of environmental collapse, and, in short, ever-greater social discontent and instability, institutional power-centers will want to increase their control over the population. As a proud plutocrat put it in a warning to his wealthy brethren, "the pitchforks are coming." And the plutocrats, together with their government representatives, want to be prepared for that.

The question is how to justify the expansion of government's surveillance and police powers that is necessary to keep the rabble in line. Clearly, pretexts are needed. And pretexts are provided whenever a terrorist attack occurs, especially if it occurs on American soil. This may be a virtual truism, but rarely is the implication articulated: in this respect, it is in the interest of government and the top "1%" in income/wealth for *civilians periodically to be victims of terrorism*. If the terrorist threat disappears, so does the useful pretext.

The "pretext" phenomenon has other dimensions. Naomi Klein discusses one of them in her famous book *The Shock Doctrine*, where she argues that in the last forty years, in the wake of catastrophes of whatever sort--natural, military, terrorist, economic--elites have taken advantage of popular disorientation and disorganization to force regimes of privatization upon the population. "Neoliberalism-by-blitzkrieg," one might call it. A prime example is what happened to New Orleans after Katrina: with the public's capacity to resist weakened, nearly all public schools were privatized. Under the pretext of education reform, "corporate profiteers and politicians have zeroed in on black communities, leaving behind devastation and destabilization," says a spokesperson of a New Orleans community group.

So, for the neoliberal state-corporate nexus, the devastation of a particular society, including a domestic region, can be eminently useful not only in smashing popular resistance to power but also in giving elites an opportunity to ram through programs they could not have otherwise. Convenient pretexts can always be thought of.

On a more general level, the relevant principle has been stated concisely by Noam Chomsky: the primary enemy of any government is (the majority of) its own population. For the population always wants more power and economic security than it has, and it is willing to fight for it (as the history of the labor movement shows)--which entails, however, the relative diminution of the power of the rich and their political minions. This corollary explains, of course, the U.S. government's continually savage treatment, through centuries, of workers, the lower classes, left-wing activists, African-Americans, protesters and dissidents and "ordinary people" of all kinds. They must be

humiliated, harmed, killed, beaten down, made examples of if they step out of line, kept in a state of constant fear and obedience (however impossible it may be to fulfill that goal). *Power exists but to maintain and expand itself*; that is its *raison d'être*, and that is the key to understanding its every move (at the institutional, not the personal, level).

For example, if government is not always blatantly aggressive in harming its own population, that is not because it's too moral to do so; it is because that might threaten its power, by stirring up more dissent. Concessions have to be made to the masses if in the long run they are to tolerate subordination. The appearance, and to some small extent even the reality, of protecting the population has to be maintained in order to appease the meddling outsiders.

None of this means that policymakers or bureaucrats or members of the "ruling class" necessarily have these intentions in mind when crafting policies or cracking down on dissent. Doubtless few are clear-headed enough. But the logic of the institutions in which they are embedded--the bureaucratic-expansionist, capitalistic, totalitarian, Panopticon-esque logic--manipulates their minds and, by some mysterious alchemy, is sublimated into rationalizations and pretexts that are usually sincerely believed in. It isn't hard to come up with pretexts to do what is in one's institutional self-interest. Humans are born to deceive themselves.

So, why not throw off all vestiges of sentimentalism about our rulers? Why not state the truth unequivocally: when a terrorist attack occurs, *this is not a failure of government*. It is a *success*; for now power-centers have another excuse to expand themselves, and to fear-monger, and to demonize the Other, and to make more profits from selling military and surveillance technology, and to clamp down ever more on the domestic population.

And when the police blindly brutalize innocent civilians or protesters, this is not a failure for government to correct. It is what the police are supposed to do, what they were designed to do and the main reason they exist in the first place. It is government acting intelligently, in its own interests and in the interests of its puppet-masters.

The population has to *protect itself* and stand up for itself, and fight for its freedom and power and security. Because the government certainly won't.

(The underlined words are links to websites.) Gonna write articles more frequently.

From now on I'm going to ask myself at various times throughout the day, whenever I remember or when some sort of intellectual or moral issue comes up, "*What would Noam do?*" Ha. Would Noam watch this YouTube video? No. Would Noam reply to this silly blog-posted criticism of something I published on academia.edu? Yes. Would Noam be *productive* in this moment, and this moment, and this moment...? Yes. --This will help keep me on the best moral and intellectual track.

[Drama with Zhilan and her daughter.]

Chicago is a desert, so I'm spending the summer in New York. Should have done this years ago. Desperately need to find some interesting, intelligent, and kind people, and especially a woman. Need a change from the treading-water existence.

Reading the excellent, and incredibly ambitious, book *Killing Hope: U.S. Military and CIA Interventions Since World War II* (1995), by William Blum.

Published a few more articles, on the state of the Left, the Fight for \$15, the ubiquity of kitsch and euphemisms in public discourse, the anarchist element in human nature (a short excerpt from my most recent book), and the value of Chomsky.

Reading David Noble's great little book *Progress Without People: In Defense of Luddism* (1993).

In case you're interested, here are the articles. [Plus one written in the summer.] The first one was butchered in many places by the editors.

The Future of the Left, and the Logic of History

The Left has always been prone to self-flagellation: what's wrong with us? Why can't we get our act together? Why can't we convince the masses to join us? Such self-criticisms are understandable and, to some extent, justified. The history of the Left and the labor movement in the United States is nauseatingly full of the leadership's cowardice, opportunism, bureaucratism, and cooptation by the corporatist state. There is much to criticize.

But many activists seem genuinely puzzled by the Left's relative impotence. Jeffrey St. Clair, editor of *CounterPunch*, laments that as one surveys the Left in America, "one looks in vain across this vast landscape of despair for even the dimmest flickers of real rebellion and popular mutiny, as if surveying a nation of somnambulists. We remain strangely impassive in the face of our own extinction."

All of this demands subtle and strategic answers. Clearly many past strategies and tactics have failed, and new ones are necessary. It's likely, for instance, that more confrontational, though nonviolent, tactics are called for, since they often seem to work better than top-down, bureaucratic, concessionary approaches.

More fundamentally, it has never been a mystery as to why the Left is not in great shape: it lacks financial and material resources. The organized Left has always been pitifully undercapitalized. This is completely predictable on the basis of materialist common sense, for, class power and wealth being distributed as they are in a capitalist society, it would be astonishing if the Left had substantial success more than a fraction of the time. One needs resources to get things done.

That is the 'historical logic' behind the Left's perennial underdog status.

Marxists, in particular, should have understood from the beginning, on the strength of their own ideas, that success in their ultimate revolutionary ends was historically unlikely. For 'the working class' to rise up as *one*, on an international scale, when the dominant classes had exponentially greater power to divide and mislead workers according to nation, race, ethnicity, sex, religion, occupation, and skill-level, was always a utopian hope at best.

Marx was right, therefore, that there is a logic, virtually a *teleo*-logic, to the development of particular societies. And this logic is essentially determined by economic dynamics, because institutions at the top of the class structure, which have the greatest access to resources, will obviously have the greatest power over the directions in which history proceeds. This 'economic determinist' core of Marxism ought to be seen as a mere truism, not a controversial theory requiring endless academic debate. But intellectuals need something to do, so maybe we shouldn't begrudge them their production of mountains of verbiage.

Given this 'logic' of history, what have we to look forward to and what lessons can we learn from the past? One lesson, I think, pertains to how activists should conceptualize their activism. There is a tendency, common among every group from centrist liberals through to Leninists and anarchists, to interpret activism in very un-Marxian and unsophisticated 'voluntaristic' terms. Supposedly radical social change is a matter mainly of will and competence, of forming strong political coalitions and pushing back against reactionary institutions so as, hopefully, to reverse systemic trends. But this hope is historically naive. Systemic tendencies cannot be stopped or reversed (though they can be mitigated), because the resources of the democratic resistance are not remotely comparable to those of the oligarchs.

For example, it is hopelessly benighted to think that an international revival of the centralized welfare state (even in an 'updated' form) and of twentieth-century social democracy is possible. Those social formations were appropriate to a time of industrial unionism and limited international mobility of capital, very different from the present. They have been dying for 40 years (starting in the US and UK), and no such magical incantation as "We propose a new anti-austerity coalition" can call them back to life. Coalitions of that sort are desperately needed, and their targets should be at every level of government, but their outcome will not be a new and improved manifestation of twentieth-century social democracy.

The proper way for radicals to conceive of their activism, on a broad scale, is in terms of the *speeding up* of current historical trends, not their interruption or reversal. This is one of the many useful lessons of Marxism. Radicals can mitigate destructive trends and hasten constructive ones, but that's the extent of the systemic 'agency' they can exhibit. Accordingly, they can have a lucid and correct

interpretation of their activism only by understanding the historical context of their society, and the significance of its dominant tendencies.

The question, then, is this: what are the main historical tendencies we are witnessing now, and how can they be finessed for the benefit of the global population? The answer is clear. We are in the early stages of the very protracted collapse of corporate capitalism and the nation-state system itself. We know that ‘climate change’ is going to constitute a global cataclysm; we know that, under the impact of neoliberal policies, the world’s social fabric is being torn apart; and even the business press recognizes that economic trends of underconsumption and overproduction portend catastrophe.

Ironically enough—but ‘dialectically’ predictable—neoliberalism is, therefore, going to precipitate the demise of the very system whose consummation it is, namely the capitalist nation-state system of privatization, marketization, rapacious environmental exploitation, endless economic growth and savage imperialism. All of this is becoming unsustainable, and a titanic global backlash is inevitable.

What radicals are doing now, in short, and should be doing, is to contribute to the undermining—the self-undermining—of corporate capitalism and the construction of an alternative. These are the historically most significant tendencies of the present.

But they will not play out in the short run. As the failure of old Marxist and anarchist revolutionary dreams from the 1870s to the 1940s showed, history prefers to progress slowly, not by means of sudden, willed insurrections that overthrow the old order and sweepingly usher in a new one. We are in for a century or two of gradual change, partly ‘interstitial’, as a new society is slowly built up within the decaying shell of the old. Glimmers of the possible new world are already appearing, some of them in the work of Gar Alperovitz and the journalism of Yes! Magazine.

If allied with social and political movements, the solidarity economy in some form may represent the future. And it is humanity’s best hope. The long-term alternative is something like a Hobbesian state of nature.

[There was a paragraph here that the editors idiotically deleted.]

Amidst the horrific tragedies we’re in for, one may take comfort in the knowledge that at least they will not be permanent. In fact, myopic anti-social politics is undermining the ruling class and its economy, by destroying the conditions for its long-term survival. It may destroy most life on earth in the process, or it may not; but the Left should recognize, in any case, that the coming crises in every country of the world will not mean the extinguishing of hope. Nor will they signify the death, or even the shameful defeat, of the Left. For the phenomenon of leftists’ continual setbacks is largely an inevitable result of the distribution of class power in our economic system.

More importantly, though, what happened in the Americas in the 1930s will happen globally this time: social semi-collapse will impel the downtrodden and the cast-off to fight together for their very survival, and to invent new forms of social and economic organization, and to build a new Left, a less centralized and bureaucratic one than in the heyday of the centralized and bureaucratic nation-state.

These facts follow straight from the logic of contemporary history, a ‘dialectical’ logic worth studying and excavating.

The Historic Potential of the Fight for \$15

[The many underlines indicating links to websites have been deleted.]

The demonstrations across the United States on April 15 revealed the significance of the Fight for \$15, and have already been dubbed “the largest protest by low-wage workers in US history.” Tens of thousands of people in 230 cities marching, chanting, broadcasting their voices over loudspeaker so that the “Masters of the Universe” could hear them—demanding fair pay for all.

Consider the scene at the University of Illinois in Chicago: thousands of black, white and brown faces cheering together—retail workers, graduate students, professionals, unions organizations for the homeless, interested individuals, schoolchildren, the middle-aged, the elderly: a panoply of humanity

shouting in unison against poverty wages, union-busting, racism, police brutality, corporate oligarchy—the status quo.

Even in its early stages, Fight for \$15 already finds itself at the forefront of a new social justice movement. As it intersects with the Black Lives Matter and feminist movements, community organizing and workers' struggles the world over, Fight for \$15 exemplifies an innovative new form of social movement unionism—the desperately needed successor to the old failed AFL-CIO strategies of narrow collective bargaining, ossified bureaucratism, and concessionary negotiations with union-busting employers.

It's time we took the fight to the streets, to resurrect and fuse the spirits of the 1930s and the 1960s. The Fight for \$15 is rapidly emerging as a key node of this revolutionary 21st century fusion—what we can expect will become a massive international movement of movements for economic and social justice.

In less than three years, the Fight for \$15 has grown from a single strike in New York City to what we saw on April 15, which included demonstrations in Italy and New Zealand. Seattle and San Francisco have passed \$15 minimum wage laws, Chicago will have a \$13 minimum wage by 2019, and other cities and states are considering similar laws.

More and more politicians are coming out in support of minimum wage hikes, which, on less dramatic scales, have been passed recently in several states and cities. Social movements take years to build, but this one is already picking up steam.

As it continues to gain visibility, moreover, the pressure it brings to bear on politicians will deepen and broaden. When issues like a higher minimum wage, anti-racism, workplace safety, immigrants' rights and social welfare are seen to overlap and are pressed forward, together, on multiple fronts—as happened, for instance, in the 1930s, when the wide range of social movements pushed American politics to the left on dozens of issues—real political change can result.

Ultimately, systemic alternatives can emerge, whether interstitially or squarely in the mainstream. As important as the Fight for \$15 is, therefore, it may be only the beginning of something truly momentous.

We've already seen other glimmers of the possible, some of which flared up only briefly and then sputtered into semi-darkness after months or a couple years. Occupy Wall Street is the best example. It had enormous influence at the level of public discourse, thrusting the issue of income inequality into the spotlight, but after being savagely repressed by the political establishment and its police goons, it rapidly petered out.

The Fight for \$15, by contrast, while lacking Occupy's creative anarchist spontaneity, is much more organizationally robust, oriented towards the long haul and towards specific legislative goals that can serve as stepping stones toward ever more ambitious goals. The movement is building networks and coalitions, politicizing working people, raising awareness, and pushing public opinion to the left. As the American mainstream becomes sensitized to the demand for higher wages and enforcement of workers' rights, it is more likely to support anti-racist policies, prison reform, action against police brutality, anti-war agendas, and other left-wing goals that all overlap.

These fights are not likely to suffer the fate of Occupy Wall Street, largely because they don't depend on a single specific tactic that is vulnerable to police action. They will build strength year by year, aided by the momentum of the Fight for \$15.

It is significant, incidentally, that a large cross-section of American business—including two out of three small business owners—supports a higher minimum wage, because it makes good economic sense. When radical ideas like these start being adopted by large sections of the ruling class—even if only in a defensive move—it is clear that the momentum is on the side of change.

In short, there is cause for optimism on multiple fronts. Of course there is little doubt that society, in the long term, is in for catastrophic social and environmental disruptions—but in the midst of these tragedies, there will still be accumulating successes, thanks to the work of activists like those who have made possible the Fight for \$15. The more of us join them, the more victories the left will be able to claim in the years and decades ahead.

The Anarchist Element in Human Nature

[This is taken from a section in my third book, which accounts for its brevity and ‘abruptness.’]

The power of mainstream indoctrination is shown by the fact that most people don’t consider themselves radical leftists, socialists, or anarchists. The way they act shows that basically they are, only they don’t know it. They think that authority not only isn’t self-justifying (to quote Chomsky’s definition of anarchism) but is often or usually unjust, and merely has to be tolerated because it can’t realistically be dismantled.

Democratic values spontaneously appear whenever people get together: they listen to each other, try to respect each other as equals, organize democratically to get things done, and resent people who act autocratically. This is anarchy in the positive sense, or anarchism in action. Grassroots organizing is ‘anarchy,’ in that top-down authority or bureaucracy is *not* the operative principle.

In fact, one can argue that ‘democracy,’ ‘anarchy,’ and ‘morality’ are but different terms for the same thing, or terms that emphasize different aspects of the same intuition about how humans ought to behave. Respect and compassion for others, openness to new ideas, the positive valuing of free communication, resistance to arbitrary authority—this whole complex of interrelated ideas, which together are mere common sense, is quintessentially anarchistic.

Nearly every valorized kind of behavior is anarchistic, while authoritarian behavior is maligned. If people deny that society as a whole ought to be governed from the grassroots up and not from the top down, they’re contradicting their own more fundamental adherence to democratic, anarchist values.

Or consider the concept of socialism. Centuries of discipline and propaganda have not persuaded most people that having a boss is a good thing. Far from it. Bosses are frequently detested, and people hate the boss system itself. They hate having to follow the orders of a “superior,” and would much rather be in control of their own economic life. This simple, obvious desire is the intuition behind socialism: workers controlling their own work, and people democratically deciding how to use resources. The practicability of such a system is shown by the success of worker cooperatives (typically more successful than capitalist businesses) and of various large-scale experiments in socialism, such as in Catalonia in 1936 (before being crushed by the forces of reaction).

In any case, whatever people explicitly think about the widely misunderstood concept ‘socialism,’ their basic acceptance of its values—when not slandered as ‘socialist’—should be obvious from their preferences about how to organize the workplace, viz., democratically.

As for the “radical left” in general, people’s understanding of social dynamics and consequent disgust show that at bottom they have a left-wing conception of the world. Judging by public opinion polls, the large majority of the population understands what intellectuals often don’t, that government is largely run by and for the rich, and that the economy functions to benefit primarily the rich. And they hate this fact. Okay, they’re leftists, at least on the inchoate level of emotion and barely-articulated understanding of society.

Moreover, their broadly left-wing, social democratic values are shown by hundreds of polls in the last fifty years. (See, e.g., Thomas Ferguson and Joel Rogers, *Right Turn: The Decline of the Democrats and the Future of American Politics* (1986).) Incredibly, according to Gallup polls a majority of Americans even supported labor unions in every single year from the 1930s to 2013, except in 2009, when only 48 percent approved of them. The average rate of approval has been 62 percent. This is despite *massive* business propaganda against unions, and a massive disinformation campaign by the media since the 1980s.

It’s clear, in short, that the natural, quasi-instinctual, default way for people to think and behave with each other—and the morally valued way—is the freedom-loving, anti-authoritarian way. Only when authoritarian institutions muddle thinking and behaving do people get confused and start to malign the values they’re implicitly most committed to.

The task of the Left is to explain these facts to people, to show them that basically they are already anarchists, and to convince them of the necessity to act courageously on their implicit anarchist values.

The Value of Noam Chomsky

At 86, Noam Chomsky is getting old. He remains indefatigable, keeping up a schedule that would exhaust a man half his age, but, unless he is indeed a demi-god, we can assume the end is nigh. The tragic day cannot be more than a few years away.

This has set me to thinking: why, after all, does it strike me that his death will mark a day of global mourning, at least among the sane and the subaltern? What is it about him that is so magnetic? There are plenty of activists around the world more heroic than he, more selfless, many people who have devoted their lives more single-mindedly to rescuing humanity from its sinking ship, and who have, perhaps, done more concrete work to end suffering. These countless unknown people deserve at least as much reverence as Chomsky.

There are, of course, many reasons that Chomsky is such a cynosure, some of them not very interesting. The most obvious is the quality of his mind. All things considered, he has probably the greatest mind of the twentieth century, and one of the greatest in human history. Einstein didn't have anything approaching Chomsky's breadth of knowledge (about virtually everything, it seems) or razor-sharp logical vision or remarkable memory. It is hard to imagine that anyone has ever been a better debater than Chomsky, as one can judge from various YouTube videos. And, of course, he founded modern linguistics, and has made important contributions to philosophy and cognitive science, and so on.

But I'll let the eulogists celebrate his intellectual powers when the time comes. There are more important topics I'd like to consider here.

Another source of his mystique is his charisma, by now a sort of shy, grandfatherly, warm and self-effacing persona, combined with an absolute self-certainty. But charisma, as such, should not impress us much: it is a sub-rational phenomenon, a form of "dominance" similar to that recognized in other mammalian species, which in itself has little or nothing to do with morality or reason. The most charismatic people can be the most irrational and immoral.

Equally striking is the fact that since the 1960s he has been a nearly ubiquitous presence, more full of energy and stamina than any other intellectual. This is impressive and helps explain the adulation he receives, but it isn't mainly what intrigues me about him, or what I find most useful about him.

His astonishing command of facts and extensive documentation of U.S. crimes are extremely useful, but they're too obvious to require comment. His unusual kindness and solicitousness towards "ordinary people"—for instance, his spending many hours every day answering emails—is likewise very admirable.

But in addition to all these considerations are things I find especially noteworthy, which may be worth mentioning here because of the lessons they hold for us. For I think that he, or his public persona, can serve as a sort of moral and intellectual compass, keeping us on the road less traveled—less traveled because it requires some effort and willful independence. It is useful to have a guide on such a path, and there is no better guide than Chomsky. To speak plainly, he can serve as a symbol of certain intellectual and moral tendencies—much as Marx does, though in a somewhat different way—tendencies that in fact amount to little more than simple humanity and common sense, but that are surprisingly easy to forget in our indoctrinated and power-hungry world.

In short, we could do worse than to take Chomsky as our role model.

*

For one thing, Chomsky is the last great Enlightenment thinker—perhaps the greatest of them. The most consistent, and maybe the most profound (unless that honor belongs to Kant). If this were an academic article I would write about his rationalist philosophy of mind; here I'll confine myself to the more "practical" side of his contributions, which is equally rooted in the Enlightenment.

One doesn't have to indulge in academic verbiage in order to express one of the central impulses of the Enlightenment: its recognition of the value of the individual. This is classical liberalism, as expressed by, say, Kant or Wilhelm von Humboldt (whom Chomsky likes to quote)—this essentially anti-authoritarian appreciation of the dignity and freedom of the individual. This is also, you may notice, morality. Respect and compassion for "the other," the other person, the other sex, the other race, the other nationality: this is the kernel of true liberalism and true morality, as encapsulated in the Golden Rule. Express yourself freely as long as you don't harm others, and express yourself so as to do good to others: liberalism and morality. These are the starting points and the endpoints of everything Chomsky has to say with regard to politics and society.

Certain Enlightenment thinkers of the eighteenth century subscribed to this moral liberalism, but, given the time in which they lived, they were periodically susceptible to illiberal sentiments, such as contempt for Africans or women or wage-laborers. Or they tried to justify imperialistic policies. Contrary to what postmodernists might think, this doesn't invalidate the Enlightenment itself; it merely shows that humans are human, products of their society, and sometimes unable to live up to the implicit conceptual content of their philosophies.

Chomsky, however, is perfectly aware of what his liberalism commits him to, and as far as I know he has never deviated from the classical liberal path in his public statements or actions. There are two things that generally deserve notice in our dealings with people and our estimation of them: first, to what extent do they recognize—fearlessly, if need be—claims of reason and logic? And second, to what extent do they act—again, with courage—on the basis of empathy and compassion (or respect for others)? These are the basic criteria we should use in judging someone's value as a human being. Chomsky evidently understands this, and so should we.

Our society, of course, sees things differently, in an illiberal and immoral way, which is precisely why it has to be dismantled and rebuilt. Society judges things in terms of power, authority, wealth, race, popularity, charisma, physical beauty, and other qualities that have either no relation or a negative relation to morality and rationality. Insofar as we, as individuals, periodically succumb to these illiberal tendencies, we must try to root them out of ourselves, even if that goal can never be completely fulfilled. We're only human, after all.

But one thing we do have control over is whether we acknowledge the force of logic and can follow chains of reasoning. If we admit that morality and rationality are, so to speak, no respecters of persons, that rank and wealth and power don't pertain to the inner worth of a person, then we're committed to fighting against society in its current form—its practices, its institutions, its cultural norms, and its authority figures. They are all apostles of illiberalism, of the coercion and injustice that radiate from what we might call *deadly snobbery*, the snobbery that happily disregards the claims to life and dignity of people without power or wealth or status (whether determined by white skin, physical beauty, wealth, or whatever).

It is the unreasoned respect for power/authority (in a broad sense) that gets you the world we have today. We unthinkingly look down on people who are "different" and respect those whom others respect, because of the human instinct to conform. So, since the amoral institutions that run society are naturally going to exalt amoral people who serve their interests—and since powerful institutions propagate the ideas and norms that influence our own ways of thinking and acting—we end up respecting amoral, irrational people, and behaving in amoral, socially irrational ways.

Thus, our anti-liberal snobbery goes hand-in-hand with our easy conformism, and both are contrary to reason and morality.

This is all implicit in Chomsky's work, and in his behavior he counters it more effectively than anyone else. He exudes contempt those with status—especially intellectuals and politicians—and respects and admires the forgotten, the millions of unknown activists, the nameless Colombian peasants who [show incredible compassion](#) in the midst of state-organized horrors, the "unpeople" everywhere who persevere in the face of savage collective torture.

The point isn't that Chomsky is a nice guy; the point is that we must all be vigilant against the anti-liberal tendencies in ourselves. We may be compelled to obey authoritarian norms in our work lives, but inwardly, and sometimes outwardly, we should rebel.

We should recognize that, other things being equal, the more mainstream success someone has, the less respect he deserves, for success only suggests obedience, uncritical acceptance of indoctrination, and the snobbery that notices only status, not morality or rationality (or *humanity*). In daily life such snobbery and institutional subservience are fairly innocent, if obnoxious and contemptible, but in the aggregate, on a large scale, they are what produce things like capitalist decimation of civil society and the natural environment, the U.S.'s [ongoing global holocaust](#) since World War II, and [the Holocaust itself](#).

The "innocent" thus merges with the evil, making all of us obedient and snobbish people complicit in the horrors that characterize the modern world.

*

Consider Chomsky's unique intellectual cleanliness. An example is his analysis of anarchism. He points out, following Rudolf Rocker and others, that the true successor to classical liberalism is anarchist socialism. This should be common sense, but since it has been buried in the manure of centuries of capitalist propaganda, few people recognize it.

If liberalism (like morality) means concern for people's freedom and dignity, then it means suspicion of power. It means that power is not self-justifying but has to be dismantled—unless it can give a convincing argument to justify itself, which it rarely can. This impulse to dismantle power-structures is the core of anarchism, and also the common sense of elementary morality, which most people implicitly agree with (whether they know it or not).

That is to say, most people are already anarchists, because the essence of anarchism is common sense. They might disagree on whether it's possible to create a large-scale society on the basis of diffused power, but, unless they're fascists or moral monsters, they agree with anarchist values, i.e., democratic values.

Chomsky is able to cut through all the nonsense of the dominant intellectual culture and state truths like these without sesquipedalian adornments, without having to indulge in elitist academic obscurantism. He recognizes, moreover, that we shouldn't worship "big names" like Lenin or Gramsci or Foucault (or Chomsky!) or any of the other more recent names that get thrown around in the media or in leftist subcultures, that to do so is elitist and pretentious—especially since most of what is valuable in the works of these "thinkers" is little more than an elaboration of common sense.

As for socialism, Chomsky is right that it means simply workers' control, economic democracy, and as such is but a component of "anarchy"—and of democracy. The Soviet Union, as a kind of [state-capitalist society](#) that allowed workers very few rights, was the precise opposite of socialism. Worker cooperatives, by contrast, [exemplify socialism](#) on a small scale.

There are countless other examples of Chomsky's lucid logical vision. He is right, for instance, that the "radical Left" is, in a sense, the only truly conservative force in politics, for it actually believes in such conservative values as community, freedom, justice, truth, and reason. It is struggling to *conserve* society against the disintegrating tendencies of capitalism. This is a point that, once made, is obvious—and that leftists should always bring up in debates with self-styled "conservative" opponents.

Radical change is needed in order to realize conservative values. One of those ironic facts with which history is replete.

Or consider these points—obvious once you hear them—that Chomsky makes about American imperialism in [this video](#) (at about the 8:15 mark). "Talking about American imperialism is a bit like talking about triangular triangles. The United States is the one country that exists, and ever has, that was *founded* as an empire, explicitly [according to the intentions of the Founding Fathers]... Modern-day American imperialism is just a later phase of a process that has continued from the first moment without a break." When you think about this statement and what it entails, you can start to see American history in a new light.

Of course, intellectuals typically think of American imperialism as starting with the invasion of Cuba in 1898. In reality, the 19th-century American expansion into the western part of the continent, which involved genocide of the indigenous population, was a particularly vicious form of imperialism. The

invasion of Mexico in the 1840s was another overtly imperialistic act. And so the record continues up to the present, the imperialism taking different forms at different times.

Especially since World War II, the United States has been the scourge of the earth, intervening constantly in any country where democratic hopes threatened to puncture authoritarianism, and actively supporting every dictator imaginable (Chiang Kai-shek, Batista, Diem, Somoza, Duvalier, Trujillo, Iran's Shah, Suharto, Mobutu, Papadopoulos, Pinochet, Mubarak, Marcos, Rios Montt, Saddam Hussein, and a hundred others) as long as he didn't pose a threat to U.S. power. Chomsky's work provides all the references you need.

Consider, also, his pithy analyses of what elementary morality requires. While other intellectuals and self-styled philosophers—often mere apologists for Western crimes—wade in the muck of "good intentions" (ours are good, theirs are bad) and subjectivism and idealized thought-experiments, Chomsky states flatly and clearly that, basically, two things are involved in acting morally: applying to yourself the standards you apply to others, and choosing how to act by considering the *predictable consequences* of your actions—*not* by having "good intentions."

With these two rules in mind, we have the tools to judge our own and others' morality. Unfortunately, neither we nor others typically come out smelling like roses if we're honest in our evaluations, because it is extremely difficult to rigorously apply to yourself (or people you identify with) the standards you apply to others. Humans are born to deceive themselves about the moral significance of their actions.

Some of us, however, can at least comfort ourselves that we're not the moral monsters who constitute the elite of powerful politicians, intellectuals, and corporate executives. We aren't directly responsible for invading and destroying countries, or for enacting policies that threaten to obliterate much life on earth, or for driving billions of people into desperate poverty and misery.

Chomsky usefully documents how Western leaders are constantly flouting the rule of international and domestic law—*their own* laws, laws that they themselves have enacted. In fact, no entity more consistently violates laws than a national government, and no one is literally more of a criminal than the leaders of a country. And their friends.

The U.S. government, for instance, simply doesn't enforce many of its own labor laws, as codified especially in the Wagner Act of 1935. Employers are typically allowed to act with impunity against their employees. In a society governed by the rule of law, on the other hand, nearly all corporate executives would be behind bars, for continual minor and major infractions.

In foreign policy, the U.S. government regularly violates its own Leahy Law, by giving military assistance to countries with no regard for human rights. (Israel comes to mind.) Chomsky points out that, while it may be too much to expect the U.S. government to abide by international law, it should at least be *feasible* that it abide by *its own* laws. But, in fact, that isn't feasible.

Anyway, the point is that what a person with intellectual and moral integrity should do is to follow Chomsky's example: adumbrate a consistent set of moral and intellectual principles, and then rigorously apply them, as objectively as possible, to oneself and to others. Don't fall victim to the "self-love" fallacy, the tendency to make excuses for your own behavior and thereby contradict your principles and sacrifice your integrity. Evaluate yourself, and your country, as you imagine an honest outsider would.

That is, "step outside yourself" and try to nullify your subjective biases.

*

Subjectivism and idealism are things I find particularly noxious, and things that Chomsky has counteracted in his work more effectively than anyone. He really is, at bottom, a Marxist, an anarchist Marxist (which is a perfectly coherent concept). He disagrees, rightly, with the orthodox Marxist theory of revolution (involving the "dictatorship of the proletariat" and so on), but his analyses are grounded in the ideas of class struggle, the imperialistic nature of capitalist power, a kind of economic determinism, and of course Marxian values of workers' dignity and creativity, and the evils of the capitalist state, and the evils of money and the market system.

He is probably the most consistent materialist alive, in his absolute rejection of the idealistic, subjectivist decadence that is [postmodernism](#)--i.e., his complete lack of interest in the discursive games that intellectuals like to play with themselves. He seems to have contempt for such self-preening verbiage machines as Slavoj Žižek, Lacan, Derrida, Baudrillard, Kristeva, and their thousands of (sometimes unwitting) acolytes scattered across the humanities and even the political Left.

But the postmodernists, fixated on language, “discourse,” “society’s imaginary,” idealistic constructions of sexuality or gender or ethnicity, are only extreme manifestations of the more general idealism of the intellectual culture. Intellectuals are naturally inclined to think that words and ideas are of exceptional importance, because they themselves traffic in words and ideas, and they want to think that they themselves are important. So they proclaim that discourses are what create and structure the world, ideologies are of primary importance to social dynamics, etc. It’s a type of self-glorification.

An added benefit of such thinking is that it has a conservative influence, for it focuses people’s attention on ideas and subjective identities rather than institutional structures and class relations. It encourages people to think that what’s important is to change ideas, rather than to change economic and political power relations.

Moreover, idealism, especially in its extreme postmodernist forms, is usefully solipsistic, individualistic, disengaging-from-social-reality. Everything is just a “construct,” there is no such thing as objective social class or objective realities of power or objective truth in general; all depends on one’s perspective or “frame of reference,” etc. Such positions are calculated to turn one in on oneself, away from the outside world, and to undermine popular struggles.

No surprise, then, that corporate capitalism has been perfectly happy with idealism and postmodernism, and powerful institutions in the media and academia have propagated them. Chomsky is right to have refused even to dip a toe into the bog of subjectivism and “discourse analysis,” or whatever one wants to call it.

Social “theory” in general he is suspicious of. He doesn’t like its elitist overtones, its Ivory Tower nature, and he thinks that, by and large, it isn’t necessary in the first place. It doesn’t require overly subtle jargonistic analysis to understand, in broad outline, how society works. One has only to recognize, for example, that institutions will act so as to maintain and increase their power, and the institutions with the most resources at their command (in particular the corporate sector) will have the most political and ideological power, and class—as defined by one’s location in economic institutions—is the central variable in determining what sorts of resources one has access to and what kinds of ideas one will accept and what one’s general life-path will likely be, and the inner nature of economic institutions is class struggle (antagonistic interests), etc.

That is to say, all one needs is a basic Marxian materialism, because materialism is common sense. Access to resources is the key, the key to survival and to social influence and to education and to political power and to a high quality of life; and access to resources is typically determined by class position. —That sentence is the kernel of materialism.

As for bringing about social change, common sense, again, tells us what’s necessary: education and organization. Join together with people whose interests lie in fighting progressively against the status quo and empowering the public; and listen to them, listen to their experiences, and offer your own experiences and ideas, and educate one another, and organize events to draw in more people, and gradually build up a movement. These are mere truisms of activism. We don’t need fancy “theory” to understand society or change it.

Now, it’s possible that Chomsky goes too far in his “anti-theoretical” stance, and that he underestimates the practical and scholarly value of, say, Marxian political economy as written by [Robert Brenner](#), [David Harvey](#), [John Bellamy Foster](#), and others. I think that such scholarship can be extremely useful and enlightening. (Chomsky would likely agree, in fact.) But only because it’s materialistic, and any correct understanding of society has to be based on a materialist foundation.

Fortunately, as class polarization increases and the global economy descends into stagnation and crisis, we can expect idealism to wane and materialism to rise. This is what happened in the 1930s, and structurally we are in a situation [eerily similar](#) to what precipitated the Great Depression.

In the coming years, as social crisis becomes the norm and the ruling class insistently professes its good intentions at every opportunity, we will do well to remember one of the lessons of Marxian and Chomskian materialism: the self-interpretations of institutional actors mean exactly nothing. The true significance of someone's acts is not given by what he thinks their significance is, because humans are born to deceive themselves (on the basis of their self-regard). Rather, it is given by analysis of his institutional functions.

People in positions of authority act as their institutions pressure them to; and if, by some miracle, they act with excessive independence, either they'll be taught a lesson and cut down to size or they'll be discarded by some means or other. So it is really the *institutions* that are the actors; the people with power are merely tools. (At high levels, people do have some freedom...but they always use this freedom only to increase their power, which is to say the power of their institution. So, again, it comes down to the objective nature of the institutional role they play.)

Thus, it is institutional analysis—grounded in materialist ideas—that matters most, not analysis of political rhetoric or self-interpretations or ideologies or “good intentions.” It's fine for scholars to study such things, but they should have a clear understanding of their “superstructural” and self-deceived nature.

Incidentally, it is worth noting again that, in a totally different sense of the word, Chomsky is very idealistic. He has the idealism that is a component in classical liberalism and morality itself: the belief in human creativity, dignity, freedom, and the capacity for generosity and love. He is convinced, with good reason—and in the tradition of Rousseau—that these traits are innate in people...just as the capacities for pathological greed, violence, power-hunger, and slavish obedience are innate. The human mind is incredibly rich, with all kinds of potentialities, both for the insatiable greed of capitalism and for the loving generosity that is normal in intimate relationships.

What matters, as Rousseau thought and common sense confirms, is the nature of the social structures in which the individual is embedded. Pathological structures produce pathological imperatives; humane and democratic structures produce more humane imperatives.

Implicit in all this, however, is recognition of the essential “equality” of human beings, even in the midst of extreme social hierarchy. We are all to some extent moldable and to some extent genetically determined; we all have various strengths and weaknesses; we all can be manipulated to act in terrible ways depending on the circumstances; and in the lives of all of us, *luck* plays an enormous role.

Any form of elitism or status-consciousness is therefore based on ignorance and unreason. What should determine how we “rank” people, in general, are only their commitments to objective reason and to morality and human welfare, because such commitments are largely within the domain of free will. We have control over them: it is up to us whether we want to be honest, compassionate, and rational.

*

Despite this long encomium I've written—which I could easily double or triple in length—I have to admit that Chomsky isn't perfect. One can criticize him, for example, for not saying enough about *positive* things that are happening. He rarely gives specific advice to activists, though he surely has a rich history of experience to draw from. He seems to rarely tell audiences or readers about particular organizations that are doing good work, and that could use support.

One might also wish that he would more often discuss capitalism as the chief source of the world's ills, to get people thinking in explicitly anti-capitalist terms. His refusal to invoke the name of Marxism seems puzzling, but evidently he thinks one doesn't need to study Marx in order to understand how the world works. And, again, he is suspicious of theoretical systems in the context of the social sciences.

Personally, when I discovered Chomsky I found him useful as a validation of my ideas about politics and the intellectual community. He was a sort of distant mentor, who sharpened my thinking and encouraged me. In particular, his unparalleled precision of thought impressed me and guided me.

For example, I was struck by his statement that *corporations are systems of private totalitarianism*: orders come down from above, a common ideology is enforced on all the workers, disobedience can be punished severely, structurally speaking there isn't a particle of democracy. I found this to be an obvious

truth once I'd heard it—and on some obscure level I had always had a similar intuition about the nature of the corporation—but his articulation of the insight fostered clarity of thought.

And that may be his greatest contribution: his absolute clarity of thought, his ability to parse complex phenomena into simple, pithy statements that capture their essence. He bypasses all the ideological accretions and intellectual chicanery, and states the truth—backed up by facts—in unpretentious, anti-“snobbish” language.

In short, Chomsky is *sui generis*. It will be a sad day for the Left, and for humanity, when he departs...but at least his writings and talks will remain, to help guide us toward a better world.

In the meantime, “don’t mourn, organize!”

In Kitsch We Trust

In a popular video on YouTube, George Carlin aims his caustic wit at the dread political scourge of *euphemisms*. “I don’t like words that hide the truth,” he kicks off his rant. “I don’t like words that conceal reality. I don’t like euphemisms, or euphemistic language.”

Our “public discourse” is, and to some extent always has been, polluted by an epidemic of euphemisms. This category overlaps with the category of *political correctness*, but it typically serves rightwing, not leftwing, ends. It also overlaps with kitsch, the category that Milan Kundera brilliantly analyzes in *The Unbearable Lightness of Being*. Kitsch is “the absolute denial of shit, in both the literal and the figurative senses of the word; kitsch excludes everything from its purview which is essentially unacceptable in human existence.”

The essence of this definition applies equally to euphemisms. Both kitsch and euphemisms serve to shield us from unpleasant truths—in other words to disguise reality.

Kitsch is everywhere where fake prettiness—or pretty fakeness—silences authenticity. It is at social gatherings, cocktail parties, academic conferences; it saturates interactions between salespeople and customers, and inspires the decor of every shop in the mall. It is the impulse that sustains the tourism industry. It is the regulating principle of institutional norms, whether in the intellectual, the political, the cultural, or the business world.

Kitsch is what coheres a consumer capitalist society, with its ubiquitous product-advertisements and self-advertisements (for the self has become but a product to be sold). In fact, power-centers in *any* advanced society will impose a regime of political and ideological kitsch on the population, for power has to lie in order to extract some semblance of consent from its subjects.

Kitsch, in short, while pretending to exalt all that is wonderful and pleasant in life, manifests the anti-human. Where social atomization happens, so does kitsch. Where power happens—and bureaucracy, and the state, and “the free market,” and atomizing totalitarian tendencies of whatever sort—so does kitsch. And in the realm of political kitsch, the use of euphemisms is indispensable.

George Carlin mentions a few. Consider the evolution of the old, honest, direct World War I concept “shell shock”. In World War II shell shock morphed into the more innocuous term battle fatigue, then during the Korean War it was called operational exhaustion, only to become post-traumatic stress disorder in the Vietnam era, or simply PTSD now. So, from *shell shock* to...an acronym.

This history exemplifies the role of power-structures in the ideological sphere, namely, to squeeze the life out of life—and out of language, and out of dissent, and out of anything that can potentially disrupt the smooth functioning of institutional relations. This is as true of academia as of politics. The imperative is to propagate appealing myths at all times; but if it proves necessary to acknowledge the existence of something negative, at the very least change its name so that it becomes inoffensive and boring. (Ideally, put a positive spin on it as well, so the bad thing magically becomes good.) *Eradicate every vestige of humanity*; that is the imperative.

We can all easily think of examples. Torture is enhanced interrogation; slaughtered children are collateral damage; a coup d'état is regime change; terrorism *we* carry out is counterterrorism; invasion of

another country is self-defense; destroying a country is stabilizing it; and imposing reactionary regimes on hapless populations is spreading democracy.

Job-destroyers are job-creators; the right-to-scrounge is called the right-to-work; the destruction of public education is “education reform”; destroying social programs and the welfare state is “austerity”; massive corporate welfare is the free market; workers’ mutually destructive competition for jobs and wages is a flexible labor market; renting yourself to a corporation is finding employment; police terrorism is called unnecessary force. The list could go on for pages.

But it isn’t only current political realities that are whitewashed. Rather, a country’s entire history is effaced, replaced with a mess of kitsch and euphemisms. This may be a truism, and we may know it, but it remains very difficult to extricate ourselves from all the subtle wordplays and techniques of indoctrination that have been used to make us think well of our society and its history.

For instance, the recently published book *The Half Has Never Been Told: Slavery and the Making of American Capitalism*, by Edward Baptist, at times may well strike the reader with the force of revelation, while simultaneously embarrassing him for having overlooked the truths it brings to light. Why do we use such bland terms as plantations and slaveholders? Because they’re euphemisms—though we don’t even know it.

Plantations were simply slave-labor camps, and we should follow Baptist in consistently calling them such. (The word “plantation” is actually appealing, quaint, pretty, conjuring images of a lovely countryside ruled benevolently by a paternalistic lord.) “Slaveholders” were *enslavers*, and we should call them such. Slaves were constantly *tortured*; that was part of their daily routine, to force them to work harder and submit to white supremacy. Half the country was a torture machine for slave labor, while the other half financed and profited from it.

The kitsch exists on a broader scale too. As Baptist makes clear—and as we all should have explicitly recognized long ago—slavery was not some marginal, economically backward thing; it was the very foundation of the modern American economy and the global industrial economy. It was an astonishingly efficient and effective way of producing cotton, such that from the perspective of economic logic it was *irrational* for slavery to be made illegal. Nothing is more modern than slavery and the economically productive dehumanization it entails.

The funny thing about kitsch, though, is that sometimes the truth is buried in it, peeking out ironically, only requiring a bit of excavation. Barack Obama, Marco Rubio and their ilk are right: America is an exceptional country. No other country was founded on, or owes its prosperity to, wholesale genocide of the native population together with centuries of enslavement of human beings. (It’s exceptional in other ways too, though they probably aren’t what Obama has in mind.)

It’s hard to look at one’s own country semi-objectively, because one is immersed in a miasma of kitsch and euphemisms. They are absolutely everywhere; they are the air we breathe as citizens, workers, and consumers. But if we can cut through the thick poisonous atmosphere of deceit and indoctrination, we may find that everything is upside down, and appearance is the opposite of reality.

We may find that in our society, as in a stagnant pond, the scum floats to the top. We’ll realize, with the historian Albert Prago, that “in an amoral society, the amoral man is best qualified to succeed.” Perhaps we’ll learn to look with contempt on the leaders and the “successful”—the institutionally obedient, the non-questioners, and the greedy, the vulgarly ambitious, the rich—and admire the downtrodden for their struggles and their stoic survival.

So, whenever a person in a position of authority opens his mouth, we should ask: “What is the reality that is being kitschified here?”

The Dismal and Hopeful Future

One doesn’t have to be a brilliant social analyst to see that the contemporary world order is doomed, destined to start visibly crumbling within the next decade or two at the latest. The neoliberal system, in fact

the corporate capitalist system, is radically unsustainable. It is too unstable, too universally rapacious, too humanly exploitative and environmentally destructive, too demoniacally self-consuming—for capitalism can profit from its self-immolation!—to last much longer.

Is it even necessary anymore to argue for these claims?

Capitalism means self-sabotage. Its profit-making interest lies in paying wage-earners as little as possible, and ideally in mechanizing and automating them out of existence, for they're expensive and troublesome with their demands for "rights" and other such nonsense. On the other hand, capitalism needs markets; it needs entities to sell things to, for that's how it makes profit. Any sort of entity would serve its purposes—alien creatures, super-advanced machines, genetically enhanced chimpanzees, whatever—but, tragically, capitalism has so far been forced to do business with the very beings it exploits and wants to deny income to: humans!

Cruel irony! The mass of mankind, against which capitalism wars in the sphere of production, it has to make nice to in the sphere of consumption, to blandish and cajole into buying commodities. This fusion of consumer and producer in the same being is the tragic contradiction that torments capitalism and drives it to manic-depression—exuberance followed by depression followed by exuberance. The capitalist elite revels in Romanesque orgies as it squeezes money out of the sweat and blood of the workers, but the party ends once markets have, as a result, so shrunk—or the worm of doubt has so grown in the minds of investors—that investment is cut back to the point of ending growth. The spread of credit may keep the party going for a long time, postponing the full effect of long-term stagnating or declining wages (and ever-more-precarious employment), but the reckoning has to come sooner or later. An economy cannot be sustained forever on wishful thinking, namely the wish that aggregate demand will remain indefinitely high even as less and less of the nation's wealth and income are going to the bottom 99 percent.

All this is just Marxian common sense, which Keynes diluted and helped make mainstream during and after the Great Depression.

So, we're in a situation now quite similar to that which caused the Great Depression. There isn't any doubt that we're in for another such event, this time more global and protracted (though also uneven and possibly not as dramatic, at least initially). We're entering the epoch of stagnation and crisis—environmental crisis too, and population crisis, and political crisis, and every other crisis you can think of. We're embarking on the slow demise of a civilization.

Incidentally, the common comparisons between the current situation and the fall of the Roman Republic and the Empire are not altogether facile or superficial. In all three cases, the rise of "income inequality" is a determining factor, as the top one percent or fraction of one percent appropriates ever more wealth and increases its power. In the case of the Roman Republic, which succumbed to civil wars and Julius Caesar and then the Empire, republican forms were gradually corrupted by the enormous wealth that flowed to Rome's elite as a result of its imperial conquests and plundering. (Sound familiar?) The rich were able to dispossess many of the poor, including soldiers, from their land, and the senatorial government did little to address the impoverishment of the masses, since it represented and consisted of the (congenitally short-sighted) rich.

Soldiers therefore became intensely loyal to their generals, since it was only through a general's land grant that they would be guaranteed an income after being discharged. Ambitious generals were thus able to build up huge, loyal private armies that made them effectively autonomous of the Roman government. The Senate could only look on helplessly as civil wars between generals ensued, the ultimate victor of which was Octavian, or Augustus.

Such social calamities are always what happen when the rich get too rich and are given too much license to do as they want. They dismantle or ignore rules that aren't in their short-term private interest—rules, nowadays, like the welfare state, protection of public resources, and collective bargaining between employers and employees—which inevitably causes the slow disintegration of social bonds, of any kind of social compact, public-spiritedness, and the very fabric of society. Privatization (such as Rome's privatization of the army and much of the land, and the U.S.'s privatization of education, natural resources, etc.) destroys public goods, thus ultimately destroying society itself—for what is society if not one great public good, one great "commons"?

There is much we can learn from the fall of Rome, which happened twice and from similar underlying causes both times.

But as for the future, is there any hope? It might seem not, but, ironically, some hope is justified by virtue precisely of the catastrophes we're in for. At the same time as these corrode the foundations of a depraved civilization, they will create—or rather, are creating—the conditions for an upsurge of popular movements and democratic initiatives that will begin outside the mainstream and eventually become visible and widespread. As any Marxist—anyone with common sense—should understand, history progresses largely by means of silver linings in terrible circumstances. This is the essence of the so-called “dialectical” interpretation of history.

In this connection it's worth mentioning the three possible “plans” that left-wing activists in Greece have come up with for their country's future, since their conceptualization, if modified, applies to the future of the entire world. Plan A, favored by the Syriza government, was to remain in the eurozone but end austerity. That plan hasn't worked out so well, in light of Syriza's capitulation to the Troika. Plan B, favored by the left wing of Syriza, envisioned a Greek default and exit from the eurozone, followed by rapid statist reconstruction of the economy. This plan, too, is unrealistic, at least for now.

Plan C is what's left, and ultimately the one that is both most revolutionary and most realistic. Jerome Roos's formulation is clear and compelling:

[Plan C calls for] a reinvigorated project of the commons and communal solidarity. In contrast to both Plan A and Plan B, Plan C would be a *bottom-up* project organized by local communities that would situate itself directly on the terrain of everyday life. Its main contributions would be threefold. First, through solidarity networks and communal support systems, it would enhance *popular resilience* by securing the means of social reproduction under conditions of extreme precarity.

Second, by creating new and strengthening existing organs of popular power, the commons would collectively act as bases for continued *grassroots resistance* to further austerity and dispossession. History has shown that, without powerful grassroots movements exerting pressure from below, even left governments are easily led astray by the siren call of domestic and international capital. To prevent this, the still relatively small and dispersed movement of commoners will have to become an organized force of political opposition.

Third, a project of the commons has *revolutionary potential* insofar as its protagonists manage to reclaim the means of production and reproduction; democratize workplaces, communities and existing political institutions; and contribute to a fundamental transformation of social relations from below. All of this is clearly still a far way off, but Plan C is precisely about cultivating this sense of perspective and direction — taking the struggle far beyond the stale dichotomies of state and market, euro and drachma.

These ideas are stated in the context of the crisis in Greece, but they generalize worldwide. Plan A, for us, is the path that the left wing of the Democratic party would pursue: remain basically in our current political economy, enact no sweeping reforms, merely tinker technocratically in a more proactive way than the Obama administration has, particularly with regard to issues of the economy and the environment. This plan would fall victim to the profound unsustainability of the corporate-capitalist political economy that it doesn't truly challenge.

Plan B would amount to a thoroughgoing shift in the state's policies, in fact a global shift (necessarily), incorporating something like Thomas Piketty's global wealth tax, but also much more. In order to set society on a new track, it would necessitate radical-left state intervention in the economy on a level that would make the postwar European welfare state seem puny.

Given the balance of power between big business and the democratic resistance, this option is totally impossible.

The only other option is the Plan C that Roos outlines—and that Gar Alperovitz and others have discussed in the context of the United States. Slowly build up a new society from below, a less atomized and more democratic society. Spread cooperatives of every kind, and public banking, participatory budgeting, perhaps community land trusts and community development corporations, “solidarity networks” and “communal support systems” of types that can’t really be foreseen at present. All this has to be done in alliance with overt political resistance, social movements that force the state (at all levels) towards the left, but not in a sudden colossal coup that attempts to reconstruct society from the top down, an impossibility.

What’s important to understand is that Plan C is not simply something that *should* be done, something that depends only on the will of activists (however important that is); rather, it almost certainly *will* be done. It is the direction in which history is proceeding, coincident with the deterioration of corporate capitalism. In the coming decades, as crisis savages civilization, people and communities across the West and across the world will be driven, for the sake of their survival and their political dignity, to invent creative solutions to their plight—to network with each other and to cooperate in the production and distribution of resources. The state will mutate—in ways we can’t foresee—in response to these initiatives and this resistance, and slowly, laboriously, a very different society will mature in the interstices and finally in the mainstream of a dying *ancien régime*.

Plan C will mature far in the future, but the seeds of it are already being planted, even in the U.S. *Yes! Magazine* has showcased some of these, and the Democracy Collaborative is one of the organizations in the vanguard of the coming revolution.

Among the many glimmers of hope are the following. Several cities in the United States have begun investing in worker cooperatives, which are, in essence, examples of socialism—economic democracy—on a small scale. (The common leftist criticism that, for now, they are forced to operate in a capitalist context and engage with the market is irrelevant.) New York City’s 2016 budget includes \$2.1 million for developing worker co-ops, up from \$1.2 million in 2015, which itself was up from \$0 in 2014. Madison, Wisconsin is giving \$1 million each year for the next five years to establish new worker co-ops.

The Evergreen Cooperatives in Cleveland, Ohio have had so much publicity since 2010 that it’s hardly even necessary to mention them here. Similarly publicized has been the United Steelworkers’ cooperation with Mondragon to establish manufacturing worker cooperatives, the first time since the 1880s that a mainstream labor union has been so closely involved in establishing co-ops. Nor is it the only one.

Participatory budgeting, having been tried first in Porto Alegre, Brazil in 1989, is now finally starting to spread across the West. It came to the United States—to Chicago—in 2009, and since then has been replicated in many other cities, though as yet only on a small scale. As its successes are publicized, it will continue to be replicated and expanded.

Public banking has had difficulty in expanding beyond North Dakota, the only state with its own bank, a remarkably profitable and socially efficacious one. Since 2009 a plethora of bills have been introduced in legislatures to establish state banks, but so far none has come to fruition. Entrenched interests have been able to stifle the growing advocacy for socially conscious banking. But one can expect that after the next financial crisis—an inevitability—and then the next and the next, the capacity of the elite to resist radical change will weaken substantially, largely because of massive popular movements.

Karl Marx was right, though, not to try to sketch what sorts of institutions would spring up during and after the “revolution.” Even now, we don’t know what new forms of social organization will appear in the next forty years and after. Society is too complex for us to predict these things.

The main point I’m making is just the old Marxist one that progress works in mysterious ways. The political economy of the twentieth-century capitalist nation-state is being dismantled—by capitalism. The nation-state is being progressively atomized, fragmented, polarized between rich and poor, parcelized and privatized, which in the long run will cause the demise of capitalism itself. For capitalism and the centralized nation-state have grown up together since the fourteenth century, and they will die together. It’s possible they’ll take humanity with them, or that a Hobbesian state of nature will ensue, but more likely is that “Plan C” will mature to the degree, and at the same pace, that capitalism succumbs to itself.

The way that historical progress happens, through crisis and the heightening of mass misery to the point that the elite can no longer resist popular movements, is indescribably cruel, but it does, at least, give us cause to hope for something good out of the horrors that await us.

June–August

Found a great apartment near Brooklyn Heights, with a young Indian couple. Quiet people. Been on a few dates; the only promising one so far was with a Guyanese archaeology Ph.D. student. Also have started going to social events (Meetup, etc.) almost every night, when not on a date. Gave a talk on worker co-ops in Long Island last week to a small group of activists from Jobs with Justice, the Long Island Federation of Labor, and the Long Island Progressive Coalition. An old activist professor had read my book—a friend of a friend of Jay had given it to him—and liked it, so he invited me; hosted me at his house in Syosset. Impressive guy, full of energy and intelligence, sort of a visionary who has founded some great organizations and been involved with New York’s Working Families Party. Meanwhile, I’ll be meeting with some activists from the New York Network of Worker Cooperatives, and will try to get them in touch with groups on Long Island (if they aren’t already). Writing the dissertation too, though it’s very slow going.

New York, of course, is awesome. I should have spent last summer here; but, as I think I’ve said, at least that summer purged me of European fantasies—mostly because of the language problem!—and matured me a bit.

I met Lulu a couple times before leaving Chicago, and now am texting with her pretty regularly. (Finally entered the 21st century and got a smart phone, which for some reason has resulted in her texting me more frequently.)

...She sent me this text message, out of the blue:

Can I make something clear? I'll probably never actually say this, because you know, ugh. But here's the thing: you were obviously incredibly important in the past two, three years. I don't even know how long it has been since you and my mom met. It was just after my first year in America and I was finally starting to reach the stage where I was no longer the kid version of a complete imbecile and became capable of actual thought. It was so important that you were there to help me realize a lot of things and see past the smokescreen that covers a majority of our tragically flawed society. You not only helped form my political views, but in other intellectual ways as well. I would not be the same way that I am now if you had not patiently helped me along. I consider myself intelligent and well versed in the world. Though of course I don't know everything, I like to think that I think beyond the shallowness that plagues most people my age, and beyond. I hardly ever, if at all, thanked you. I can't bring myself to do it. And if you ever bring this message up again I will likely punch you. Anyways, it was important that someone was there to shape my mind, especially someone who was able to deal with my screaming me and ranting and ridiculousness that hopefully I've managed to control slightly better now, though I'm sure I will feel the same way two years from now. So yes, this is me finally thanking you, though not in person, for everything you've done. I will never truly like classical music, but you have helped me appreciate at least its superiority and importance. Philosophy, science, writing would never have fascinated me as much as it still does now if you hadn't been there to talk to me about it. I will read those articles, I've promised. Sometime soon. Okay. But one more thing, I'm also at that stage where the only thing I am openly interested in is reading and my friends. We will email, and text, and I will no doubt incessantly bother you when something really bad happens because I sometimes need someone to talk to who

is not my age. Someone who has always, mostly, been there before. [...] I am going to regret sending this, but it needs to be and should be done. So thank you, once again, for everything.

I was surprised to get that, to say the least. I think I'll always treasure it.

[Deleted descriptions of dates and suchlike with incredibly flaky people.]

I'm leaving New York in a couple weeks, on August 22. This summer has, like the last, stimulated some personal growth, though only in the direction of more cynicism and ennui. For the last few weeks I haven't been writing the dissertation (partly because of a lack of sources here), haven't been doing much else either except go to some social events and go on more ultimately pointless dates.

...And yet, ironically, a week later it's clear that this summer has somewhat rejuvenated me at least with regard to living in Chicago. Somehow, maybe because my spirit is invincible, I'm ready to start looking for a good woman again over there. While I would still prefer to live in New York, I know now that Chicago isn't *awful* compared to it. Most people are pretty awful wherever you go in the world. I still think I would have—and I *did* have, this summer—more romantic and social success here than in Chicago (such as with the singer who invited me up to her apartment where I spent the night, only finger-fucking her etc. because I wasn't attracted to her), but it isn't like some sort of gigantic categorical difference between the cities.

Strange to say, I'm even looking forward to working again on the dissertation. After more than a month of idleness, I miss being productive.

September, October

One of the popular ideas in feminist circles now is that gender shouldn't be a binary system, masculine vs. feminine. It should be [or *is*] fluid, a spectrum, blah blah. One is tempted to say to these people, "Okay, change starts with the self, right? So why don't you try to be attracted to guys whom you perceive as less-masculine or non-masculine, and see how well that works out for you. Put your ideas into practice. Try, for once in your life, not to be a hypocrite. If you want gender to be fluid, then 'get with' a non-classically-masculine goofy and intellectual kind of guy!" (Har-har.) You can see how deeply committed these politically correct people are to their ideas by the fact that, in their actions and emotions (sexual or otherwise), they continue to valorize masculinity and to devalue extreme femininity.

The fact is that women will always value masculinity and men will value, or rather half-value, femininity. Duh. The "binary" thing, unfortunately, is unavoidable.

I wish it didn't bother me so much that 90 percent of people are shallow, moronic thinkers, self-blind hypocrites. I think about that fact often and it appalls me, especially in conjunction with people's persecution of anyone who exhibits intellectual courage and integrity. I abhor the mass man.

Reading George Huppert's very good book *After the Black Death: A Social History of Early Modern Europe* for a class I'm TAing. Also Hugh Trevor-Roper's *The Last Days of Hitler*.

Another of the things feminists will never acknowledge is that there are a lot of perks to being of a lower status than men. Yes, it's unfortunate that nature has apparently guaranteed that in every society women will be, at least implicitly and in subtle ways, the "second sex,"¹ but there are so many

¹ As usual, since we live in a culture of totalitarian stupidity, I have to "defend myself" by invoking common sense: even if there were no other reasons for women's subordinate status, it would basically be guaranteed by their relative physical smallness and weakness, just as relatively small and weak men are, *ceteris paribus*, treated as subordinate to large and strong men. (Cf. most other species of animal.) So please stop confusing your postmodern-feminist stupidity with ethical high-mindedness. We might as well be realistic instead of lying to ourselves.

compensations, as Emerson might say, that it's perfectly possible, even common, for women to be happier than men. For example, decent people frequently act more politely and kindly towards women than men. Also, young women often get free drinks and meals, and are showered with attention. The pleasures of primping and make-upping are, apparently, not to be laughed at. Women tend to have more spontaneous fun in any given activity—dancing, socializing, sex (sometimes)—than men. Motherhood is a deeply satisfying experience. Women don't know the pain of male sexual frustration. They can get away with an incredible amount of misbehavior (e.g., verbal and physical abuse), immaturity, and stupidity, a fraction of which would get a man ostracized or arrested. [...] *Women get to choose their man*, more than vice versa. (Assuming they're attractive, if they really want a man, they can usually find one—unless they're too picky and keep rejecting men until they're dried-up old spinsters. As evolutionary biologists put it, the females choose while the males are chosen—although of course it isn't *quite* so clear-cut on the level of humans.) Etc.

Obviously it's necessary to challenge the social inequality of the sexes, because it sometimes takes terrible forms. But some degree of inequality is natural, and, to repeat, there are compensations for it.

Huppert's book is very rich, but the last chapter has a particularly pithy statement that struck me: "It is at the intersection of firepower and state power [in early modern Europe] that the secret of Europe's transformation is to be sought. It was warfare, a new kind of warfare, which brought the state into existence: its chief function was to find ways of paying for the ever increasing costs of war. Silver, gold, credit, technology, manpower—all were harnessed for this purpose. The world was scouted for new resources while fabulous profits were made by investors and contractors in the high-risk business of war." Reminds me a little of what David Graeber says about the ancient state, which was created in large part to make war. Except now, for the first time, war really became a *business*. And has remained so. It was and is something to be pursued because it produces *profits*. Shareholders get wealthy by funding mass killing.

I started reading John Mikhail's Chomsky-recommended *Elements of Moral Cognition: Rawls' Linguistic Analogy and the Cognitive Science of Moral and Legal Judgment* (2011), which looks quite interesting, but damn it, I think it's more responsible for me to get back to reading history. Especially labor history, since that'll help with the career and so on. So now I'm reading Elizabeth Fones-Wolf's *Selling Free Enterprise: The Business Assault on Labor and Liberalism, 1945–60* (1994). Skimmed parts of it a couple years ago, and its central arguments are obvious to anyone who has read history, but what the hell, I might as well read it in depth. Chomsky is right that it's an important book.

Now reading *The War on Labor and the Left: Understanding America's Unique Conservatism* (1991), by Patricia Cayo Sexton.

Now *Struggle for the Soul of the Postwar South: White Evangelical Protestants and Operation Dixie* (2015), by Elizabeth Fones-Wolf and Ken Fones-Wolf. Among other things, useful background to the contemporary conservative-Christian insanity.

Interlude: Richard Lewontin's article "The Evolution of Cognition: Questions We Will Never Answer." An article that counsels skepticism about humans' ability to understand themselves and nature, in this case because of a lack of sufficient data (rather than a lack of cognitive capacity, as Chomsky and Colin McGinn argue—rightly, and obviously). All I can say is: are there actually idiots out there who think we'll ever fully understand human cognition, or the human mind?? The very idea is preposterous, not only in light of practical constraints but even in principle. It's even more ridiculous than the idea that someday we'll have a complete physics of the universe, including of the Big Bang. When I was 14—or younger—I understood that the human mind is limited, and that the *data* we have are limited. Because, after all, it's incredibly obvious, to any sane person who thinks about it for two minutes. Lewontin's impatience (in a letter to the book's editors) is justified:

I must say that the best lesson our readers can learn is to give up the childish notion that everything that is interesting about nature can be understood. History, and evolution is a form of history, simply does not leave sufficient traces, especially when it is the forces that

are at issue. Form and even behavior may leave fossil remains, but forces like natural selection do not. It might be interesting to know how cognition (whatever that is) arose and spread and changed, but we cannot know. Tough luck.

And: no shit. What a commentary on our silly intellectual culture that Lewontin actually has to devote an entire article—a controversial one, incidentally—to arguing this utterly trivial point! Just think how many gaps there are in the fossil record. Think how many data we'd need to reconstruct the rise and spread of cognition. Think how inconceivably complex—and almost entirely shrouded in silence—the history of hominids is. All we can do is “tell stories” about how evolution *may* have proceeded, and *why* it may have proceeded in certain ways. Eighty percent of nature, or rather of the aspects of nature we're interested in, will forever be a mystery to us.

Now reading *Rebel Rank and File: Labor Militancy and Revolt from Below in the Long 1970s* (2010), a large collection of essays. Excellent and informative book.

I like Charles Tilly's 1985 essay “War-Making and State-Making as Organized Crime.” To a good first approximation, government is just a gigantic protection racket (and extortion racket). As long as you pay me and obey me, I'll protect you; if you don't, I'll hurt you. It may be that the services government renders are worth the costs; but the “protection racket” model still applies. And certainly the ways that governments are formed (over centuries) constitute, in essence, organized crime. (And of course after being formed, much of what they do remains colossal organized crime, of a thousand different varieties.)

At the end of the essay he has some useful thoughts on why the states that were formed after decolonization in the mid-20th century tended to be quite different from European states:

The extension of the Europe-based state-making process to the rest of the world, however, did not result in the creation of states in the strict European image. Broadly speaking, internal struggles such as the checking of great regional lords and the imposition of taxation on peasant villages produced important organizational features of European states: the relative subordination of military power to civilian control, the extensive bureaucracy of fiscal surveillance, the representation of wronged interests via petition and parliament. On the whole, states elsewhere developed differently. The most telling feature of that difference appears in military organization. European states built up their military apparatuses through sustained struggles with their subject populations and by means of selective extension of protection to different classes within those populations. The agreements on protection constrained the rulers themselves, making them vulnerable to courts, to assemblies, to withdrawals of credit, services, and expertise.

To a larger degree, states that have come into being recently through decolonization or through reallocations of territory by dominant states have acquired their military organization from outside, without the same internal forging of mutual constraints between rulers and ruled. To the extent that outside states continue to supply military goods and expertise in return for commodities, military alliance or both, the new states harbor powerful, unconstrained organisations that easily overshadow all other organizations within their territories. To the extent that outside states guarantee their boundaries, the managers of those military organisations exercise extraordinary power within them. The advantages of military power become enormous, the incentives to seize power over the state as a whole by means of that advantage very strong. Despite the great place that war making occupied in the making of European states, the old national states of Europe almost never experienced the great disproportion between military organization and all other forms of organization that seems the fate of client states throughout the contemporary world. A century ago, Europeans might have congratulated themselves on the spread of civil government throughout the world. In our own time, the analogy between war making and state making, on the one hand, and organized crime, on the other, is becoming tragically apt.

Now the Chomsky-recommended *Political Economy and Laissez-Faire: Economics and Ideology in the Ricardian Era* (1986), by Rajani Kanth. Classical political economy as class war, against the aristocracy and the poor. (Kind of obvious, actually.)

A useful passage:

[With the Speenhamland “amendment”—in 1795—to the Elizabethan Poor Laws, which, among other things, sanctioned the idea of outdoor relief to the able-bodied, legislators] acknowledged in practice what was imperfectly the latent principle of Poor Law legislation from earlier times: that society is an organic entity whose every segment, including the poor, has a right to the existence that it is the duty of the state and the superior orders to provide.¹ The noblesse, one might say, had to oblige. This was the idea that seemed an abomination to the classical economists and their stringent economic philosophy. And this was a principle that they inveighed against in their resolute opposition to this aspect of the Poor Laws which ultimately resulted in their “reform” in directions more suited to the achievement of classical ends... Their call to laissez-faire in this context meant the denial, in accordance with their vision of society, of the right of the laboring poor to maintenance outside the market-determined context of the social relation of wage labor. The recourse to laissez-faire as a general principle on this issue was intended to repeal the recognition of this right by a paternalistic state. The negative nature of the laissez-faire injunction was a means to achieve many things; but two of the most important issues it helped to undo were the Poor Laws and the Corn Laws. The class context of these two issues makes the meaning clear; if the first needed a rejection of state support to the laboring classes, the second required a denial of the rights of the landed aristocracy to state support. In so denying state action on behalf of two major socio-economic classes, semi-feudal and semi-proletarian, the doctrine of laissez-faire rationalized the ends of bourgeois society and the state—a modification and restructuring of the institutional behavior of these two classes vis-a-vis the capitalist mode of production.

...So the agitation against the Poor Laws is the phase of laissez-faire against the poor, in favor of the capitalist mode of production which requires a free and mobile labor force devoid of access to means of livelihood other than through the wage-labor-capital relation. The agitation against the Corn Laws was laissez-faire against the landed oligarchy, again to favor the new economic system by lowering the rental and wage “deductions” from value. Once these two major objectives of the political economy of laissez-faire, i.e. the neutralization of the aristocracy and the orderly growth of the proletariat, were achieved, the sphere of laissez-faire was to be relaxed. Thus, John Stuart Mill, by 1848, was ready to allow for greater intervention. In fact, the trend is steadily noticeable after the Reform Bill of 1832, that early victory for the political power of capital. Intervention, henceforth, would be increasingly necessary to secure both the unity of capital and the acquiescence of all social orders in the new system.

Malthus did much to stir up educated opinion against the Poor Laws (especially public outdoor relief for the able-bodied). “The provision of sustenance to the poor, he argued, only increased the pressure of population on scarce food supplies by multiplying their numbers; hence, to help them was to hurt them.” In thrall to an abstract and “scientific” ideology, he opposed all kinds of charitable and humane endeavors—and met with success in his proselytizing, since his beliefs accorded with manufacturers’ interests. (In other

¹ The agrarian social order was rooted firmly in this conviction. As Hobsbawm writes, “The traditional view, which still survived in a distorted way in all classes of rural society and in the internal relations of working-class groups, was that a man had a right to earn a living, and if unable to do so, a right to be kept alive by his community.”

words, wealthy and powerful people were on his side. He was a useful idiot, like all ideologues are, from one perspective or another.)

Ricardo, too, opposed the Poor Laws on the grounds of their interference with “liberty” and the sacred market, even wanted them totally abolished, a position deemed too extreme by politicians and many economists because of the threat it might pose to social order. But they liked his insistence that taxes and government expenditures should be kept to a minimum because they discouraged capital accumulation, which was the foundation of social progress. (Two hundred years later, economists and politicians are saying the same thing. Behold the barren and formulaic nature of capitalist propaganda.) Benthamite utilitarianism joined economic liberalism in opposition to the Poor Laws, since, given the painful character of labor and man’s “natural” inclination to avoid it except under dire necessity or when tempted by generous rewards, they were supposedly lending support to humans’ natural laziness. As the upper classes had been saying for a long time, poverty was *good* inasmuch as it stimulated the poor to work; and so it should not be relieved by governmental means. But even if one didn’t accept that poverty was a positive good, it was agreed by all these liberal/capitalist types that relief interfered with incentives to work. (Again, an idea that remains characteristic of the ruling class.) Bentham, of course, was an ardent partisan of capitalism—and of surveillance, total control of workers, forced labor camps for the poor, etc. In many respects he anticipated totalitarianism (and also radical behaviorism, in some ways).

The new Poor Law of 1834, largely written by Nassau Senior, one of the classical economists, was a savage measure—even though Senior himself, and others, thought it didn’t go far enough, for it didn’t *unequivocally* end outdoor relief. To quote Hobsbawm, “there have been few more inhuman statutes than the Poor Law Act of 1834, which made all relief ‘less eligible’ than the lowest wage outside, confined it to the jail-like workhouse, forcibly separating husbands, wives, and children in order to punish the poor for their destitution, and discourage them from the dangerous temptation of procreating further paupers.” Another historian observes that between 1834 and 1847 “the working class was reminded every day that the only choice for the poor man, when misfortune befell him, was the choice between starvation and disgrace.” Needless to say, the Act was a great triumph for the market economy and the bourgeoisie, for it put the finishing touches on the decades-long creation of a disciplined proletariat.

John Stuart Mill, despite his relative humanity, supported the new Poor Law. On the other hand, by 1848 he took the position, against Ricardo, Senior, and the others, that the poor had a “right to live,” a right to subsistence, and even speculated that “the state might guarantee employment at ample wages to all those who are born.” A *very* different position from his economist predecessors. But by now it was safer to take such a view, for the Chartist and Owenist revolts had been defeated and a categorically subordinate proletariat had been formed. “Once converted into a proletariat...the working poor had a right to exist and make demands upon the public revenue; and the classical economists, within bounds, were solicitous of this right. They, the laboring poor and not the unproductive poor, were the true wards of society.” Not incidentally, the support of the proletariat was needed now to prevent any rearguard action against industrial capitalism by the landed aristocracy.

Anyway, the broader point is that classical economics was formed, and then transformed, in relation to specific material and political issues of the time (a fact that is almost universally ignored in scholarship). Its main early task was to give ideological support to the construction of a market economy; once that had been achieved, its holy axioms and theorems could be tweaked or revised in support of new policy imperatives.

After the chapter on the repeal of the Corn Laws is a long discussion of the ways in which the classical economists were, and were not, committed to the ideology of *laissez-faire*. The most interesting part is what’s said about Adam Smith. In recent decades he has been invoked as the great apostle of *laissez-faire* and a small state, as if he argued that government intervention is by nature wrong, such that almost everything should be left to the market; but this is a caricature of his real position. To understand him, you have to understand the social and political context in which he wrote. His target was the mercantilist state and its protection of monopolies, its overweening regulations, its obstructions to capital accumulation and the production of wealth. “His reservations about the nature of governments are to be seen as specific criticisms directed against the state machine of his own time,” which he saw as corrupt and subservient to

the selfish ends of the monied and landed classes. But he was perfectly prepared to admit that regulation could sometimes be good, and he enthusiastically supported public works and government involvement in education, among other things. To quote one of his interpreters,

Adam Smith was no doctrinaire advocate of laissez-faire. He saw a wide and elastic range of activity for government, and he was prepared to extend it even farther if government, by improving its standards of competence, honesty, and public spirit, showed itself entitled to wider responsibilities.

Indeed, one might turn the arguments of contemporary conservatives—in their appropriation of Smith—on their head: much of his suspicion of government was rooted in his knowledge that the class of merchant-manufacturers, which he hated (and which modern conservatives represent), was constantly trying to capture the state for its own “vile” purposes. And was having some success in doing so.

Insofar as Smith’s hostility toward government was general and not limited to the British state of his day, it was rather philosophical, derived from the French and Scottish Enlightenments and their notions of natural law, natural liberty, and so forth. This is quite different from the later classics, such as Ricardo, James Mill, Nassau Senior, and McCulloch. They were not Enlightenment philosophers far removed from politics but active participants in fierce political struggles on behalf of a rising industrial class, which Smith had had no inkling of. They invoked laissez-faire for their own partisan ends, as a tactic. As Kanth says, “for Smith, laissez-faire was a policy directed toward the elimination of mercantilist restrictions on capitalist accumulation, quite beyond the pale of a narrow class reference, whereas in the hands of the later classics it served as a deliberate class tactic in limiting the demands of the landed and laboring orders upon the state. What, for Smith, had been the antidote to the political economy of protectionism in the widest sense, became transmuted later into a mere instrument of class combat.” Smith, in short, was more disinterested than his semi-disciples, and his understanding of “government non-interference” was correspondingly different. More elevated and abstract, so to speak, and not subordinate to particular class ends. But it’s true that he and the later classics shared an appreciation for the market economy and advocated the dismantling of protectionism.

It seems to me that, while there are many differences between the post-Smith classical economists and today’s neoliberal economists, they’re similar in their use of the ideology of laissez-faire when it helps capitalists and repudiation of it when it hurts them. They call for governmental non-interference with the market in the cases when such interference benefits classes other than the capitalist, while calling for, or at least supporting, interference in the cases when it is to the advantage of capitalists. But there was probably more intellectual integrity among the “classics” than among today’s economists, who willfully ignore a colossal body of evidence that contradicts their nostrums.

Now reading *The Reactionary Mind: Conservatism from Edmund Burke to Sarah Palin* (2011), by Corey Robin. An elegant and erudite elaboration of an obvious thesis, that the essence of conservatism, in all its seemingly contradictory permutations, has always been the impulse to defend power and privilege against movements demanding freedom and equality. Conservatism is “a meditation on—and theoretical rendition of—the felt experience of having power, seeing it threatened, and trying to win it back.” Yup. Nothing could be more obvious than that. It’s a good book, though.

A point that Robin doesn’t make—maybe because it might muck up his argument—is that insofar as conservatism “begins from a position of principle—that some are fit, and thus ought, to rule others,” most intellectuals, politicians, and businessmen are, at least implicitly, conservatives. Even the ones who call themselves liberals. ‘We superior people are *supposed* to run the world; the masses are “meddlesome outsiders” whom we have to distract and delude, for their own benefit.’ The whole establishment is, loosely speaking, conservative, always trying to tame and often to destroy democratic movements. During times of upheaval, the conservative colors of nearly everyone with some power and privilege shine bright (for everyone wants to defend his power and privilege as soon as he sees it threatened). But it’s true that not everyone in the establishment is *robustly* conservative.

Here are some interesting thoughts on what is common (among other things) to all conservatives from Burke to the present:

Conservatism also offers a defense of rule, independent of its counterrevolutionary imperative, that is agonistic and dynamic and dispenses with the staid traditionalism and harmonic registers of hierarchies past. And here we come to the conservative's deepest intimations of the good life, of that reactionary utopia he hopes one day to bring into being. Unlike the feudal past, where power was presumed and privilege inherited, the conservative future envisions a world where power is demonstrated and privilege earned: not in the antiseptic and anodyne halls of the meritocracy, where admission is readily secured—"the road to eminence and power, from obscure condition, ought not to be made too easy, nor a thing too much of course"—but in the arduous struggle for supremacy. In that struggle, nothing matters, not inheritance, social connections, or economic resources, but one's native intelligence and innate strength.¹ Genuine excellence is revealed and rewarded, true nobility is secured. "*Nitor in adversum*' [I strive against adversity] is the motto for a man like me," declared Burke, after dismissing a to-the-manor-born politician who was "swaddled, and rocked, and dandled into a legislator." Even the most biologically inclined and deterministic racist believes that the members of the superior race must personally wrest their entitlement to rule through the subjugation or elimination of the inferior races...

The battlefield is the natural proving ground of superiority; there, it is only the soldier, with his wits and weapon, who determines his standing in the world. With time, however, the conservative will find another proving ground in the marketplace. Though most early conservatives were ambivalent about capitalism, their successors will come to believe that warriors of a different kind can prove their mettle in the manufacture and trade of commodities. Such men wrestle the earth's resources to and from the ground, taking for themselves what they want and thereby establishing their superiority over others...

In revolving around the worship and defense of *power*, conservatism naturally incorporates the attitude that has come to be called Social Darwinism. Actually, in a sense, the general agonistic ideal is appealing to me, the ideal of testing limits, testing oneself against others, triumphing over adversity and all that. Probably all people find it at least somewhat attractive. It's one of the pleasures of *games*, for example. (Contending against others and proving one's superiority, in a sense.) It becomes noxious only in certain forms, in collectivist contexts and when millions of lives are at stake. It's noxious—and wildly simplistic—when it's used as a legitimation for power.

Anyway, it's clear from what Robin says above that, even on the purely intellectual plane, the seed of fascism exists in all conservatism, including American libertarianism (which incorporates Social Darwinism).

While I always find it intriguing to trace and probe ideas and intellectual history, I'm too much of a Marxist to think there's anything of foundational value in a book like Robin's. When you get right down to it, conservatives and the powerful are little more than tools, indeed embodiments (metaphorically speaking), of particular institutional relations and pressures, of agglomerations of resources that are defined by certain interests, which conservatives serve. From the perspective of power-structures, these people are nothing but useful idiots, tools possessing the strange and inconvenient quality of consciousness (and *some* free will), which compels them to invent, for the sake of their own self-love and need to deceive themselves, all sorts of rationalizations and idealizations of power's impulse to defend itself and augment itself. Power sets its conscious robots in motion to do its bidding, obey its orders and rationalize them for public

¹ [Here we encounter one of the many points on which conservatism is utopian and utterly naive: its abstraction from real life, from social context.]

consumption and the robots' own self-justification. But what matters, ultimately, isn't what the robots say but what the institutional dynamics are that they serve and reflect.

It's hard to be productive when one is twisted by loneliness. Going to events, meeting people, going on dates...none of it helps. People have no character, no interest in others, no interest in staying in touch, no ability to keep commitments they've made, no thoughtfulness or empathy.

We live in the Hobbesian state of nature, although it's below the surface. Soon, in light of societal conditions, it may rise to open view.

While reading those books on ethics a while ago, I jotted down some thoughts to return to later. Here they are:

Christian and other cultures' horror of the body. Partly explainable by the body's resistance and self-will, its contradiction of our self-control and free will; we're prisoners of it, it's the master. It also smells bad and looks bad and so on. –Implicit dualism here, of course, between self and body.

Why do people always think (like Plato, the religious, etc.) that the inner essence of the world has to be *good*? That the world in itself must have value? Because of humans' innate affirmative stance towards the world? Desire for life's meaningfulness? Desire for recognition from something grand and good? (See the beginning of Korsgaard's book.)

Would you give away the Jew to the Nazi to save your own life? Why would that make you feel disgusted with yourself? Because of the Other's judgment of you. But is that judgment justified? Are you contemptible because of your act? Yes and no. Are such questions purely imaginary, fictional, social inventions? There is no right answer to them. In one mood you might act one way, in another a different way. You don't have a fixed, 'contemptible' (cowardly) identity. But there can be some truth to the judgment anyway, right? It's partly true and partly, maybe, false—and even partly meaningless.

Origin and meaning of the 'open question' argument.

Why do we have moral concepts? Where do they come from?

Contrary to Korsgaard, we do want moral *knowledge*. (p. 47) We think *it's true* that murder is wrong, just as we think it's true that the earth revolves around the sun. (Intuitionism?) Our moral beliefs aim for a kind of objectivity. We want there to be objective values—indeed, we want to have objective value ourselves. This is one of the reasons for believing in God, etc.

Hume, p. 50

Naturally having good impulses vs. forcing oneself to act in a good way. Which is better? Which is more praiseworthy or morally impressive? Should you have contempt for yourself if you have bad impulses? What does being a good person even mean? What are the criteria? Is it nothing but a baseless social construction?

What does normativity *mean*? What does 'ought' mean? (Derivations from other values. To act in accordance with particular values.)

Why should morality be binding on me? Why should I always follow it, even when it's inconvenient? From whence does normative force arise?

What is value?

pp. 102 ff.

People don't truly understand the significance of 'God is dead.' Objective value is dead; recognition from a transcendent other is dead; the world is topsy-turvy and meaningless. Institutional authority means nothing (which means conformism is based on a flawed premise, since it has faith in authority). All authority means nothing—except the authority of reason! That's the only anchor.

'Intrinsically normative' entities?? Misleading or meaningless. p. 112

The difference between right and good. Impossible to make a clear, compelling distinction?

Moral identity is necessary, unlike other identities, because it means valuing yourself as a human being, which underlies all other identities. Sound argument? (pp. 121–122.) Doesn't seem so.

(Different subject: *speaking to institutional relations* vs. *speaking to people*. It's the latter I'm interested in.)

Why do we have contempt for people who lack integrity? And what's the ethical significance of that contempt?

Why do we care so much about justice and injustice? Why are we outraged at injustice? (p. 112 of Mackie.)

What is the good life? ("Viable concept of happiness.") *Meaningfulness*. Should it involve universal benevolence? It can't, surely, but is that even a worthy ideal? (171) Some conflict is good, not to mention inevitable.

Mention [in a future essay] that I'm an error theorist about many things, such as colors, abstract objects, the self, life's 'meaningfulness,' values, and our conventional understanding of society.

If you can't convince the 'radically disaffected' why they should be moral, do moral obligations really exist at all? In fact, does this inability not show that it isn't necessarily irrational to be immoral? And hence: a kind of moral skepticism? (pp. 179 ff. of Korsgaard.)

Moral obligations are first and foremost obligations to myself, not others? [To maintain my identity, my self-respect, etc.] Seems weird. But there must be a particle of truth to that idea.

"An obligation takes the form of a reaction against a threat of a loss of identity." (181, 183) Maybe some important truth to that. It's "the experience or phenomenology of obligation." But the identity isn't necessarily a *moral* one, surely.

G. A. Cohen seems right, and Korsgaard wrong: I'm not necessarily committed to valuing my humanity, or the humanity of others. (Or the animality of animals and humans, etc.) In valuing myself, I'm not necessarily valuing my humanity. —But if my humanity is the source of my reasons and values, maybe I do implicitly value it after all. How does one decide this issue? In a sense maybe I do value it, but in another sense I certainly need not (explicitly).

(Write about why the Enlightenment's agenda isn't refuted by the 20th century. Humans have a dark side, yes, but the way to mitigate and counteract it is precisely by challenging power, by using reason, by fighting for freedom and democracy.)

Nagel's weird realism, p. 206, first complete paragraph.

Integrity = unity of the self. (Korsgaard, 229.)

Morality = respect and compassion for others, and for as many people as possible. That's the basic principle. It's imprecise, which helps account for the difficulty of fleshing out a consistent and intuitively compelling moral system that applies to all contexts.

Hare's definition of realism: 40, 41 of *Morality and Objectivity*. See also 43, second full paragraph. Values are not 'real' in either cows' sense or numbers'. (Value statements can be true or false only on the basis of other values, but ultimately it's all arbitrary. Different from numbers. People think moral statements can be true or false, but in the sense they implicitly mean, that's wrong. As Mackie argued, I guess.) But what exactly is the difference between 'there is a cow in the field' and 'Smith's act was wrong'? One is objective, in some sense, while the other isn't in that sense.

Doppelgänger problem.

Are moral judgments all false? Or are they neither true nor false? From one perspective, the first; from another, the second. (1) There are no moral properties to make them true, so they're false. But (2), there are no moral properties to make them false either. Something is neither wrong nor right; moral properties don't exist, so they don't apply to it. And yet, in another sense (3), we can invent moral properties and so make moral judgments true or false in a 'constructed' sense.

Mackie book, footnote on page 39.

How to explain the psychological power of following authority [i.e., the desire to follow it]? Authority is like the Other, full of self-certainty etc.—it's really the world, in a way—so you want to obey it, coincide with it. (By identifying with authority, you become an authority yourself.)

And ideas for articles to write:

An article on self-deception? Pretexts that people believe in, but they're still pretexts.

Conflicts between the sexes partly a result of capitalism [or the atomizing culture of late capitalism]. (Don't blame things on the opposite sex. Blame them on the system.)

Market and state, or market and bureaucracy, are not opposed, contrary to what conservatives think. They go together: market requires massive state. Market is actually created by state. (See David Graeber's Iron Law of Liberalism.)

We should state things as they are: corporate executives are *corporate bureaucrats*. Not really any different from government bureaucrats.

It's incredible how *rigid* most people's ideological commitments are. And how rigid their minds are. Goes along with a kind of stupidity. Being on the Left should mean open-mindedness.

Social life rests on violence. Implicit violence is everywhere. Otherwise people would rebel and society would fall apart, or transform into something very different.

I mentioned an essay I wanted to write on pretentiousness. I started it last year but abandoned it, at least for now, since it would never get published. It would be too original and too critical of intellectuals to get published. Here was the beginning:

Thoughts on Pretentiousness

Excluding the sciences, the history of abstract thought can almost be called the history of reflections on interesting concepts. Whether truth, reality, God, knowledge, justice, goodness, freedom, love, or even “camp,”¹ dozens of pithy concepts have captured the attention of the reflective. Even people not prone to contemplation are on occasion, in receptive moods, seduced by the mysteries of such ideas as love or God or truth or “existential meaning.” They debate them eagerly, show stubborn commitment to some particular conception, momentarily care about the musings of a Plato or a Kant or a Nietzsche. Evidently the human mind is drawn not only to abstract reflection but to thinking about *words*, or rather about the conceptual implications and limits of particular words. It can be fascinating to examine how we use words, and what meanings are hidden in their etymologies or conceptual overtones. It’s odd, then, that in thousands of years of word-dissection, apparently no one has devoted much attention to one of the most pithy and revealing concepts of all: *pretense*, with its derivative *pretentious*. The derivative form is more common, as it aptly characterizes an enormous range of human behavior. The profundity of this concept has perhaps never been appreciated, nor has its potential to shed light on human psychology, institutions, social structures, the norms and roles—largely class-determined—that structure social life. The word’s significance is suggested by the fact that it is closely related to such fruitful and enigmatic concepts as *authenticity*, *sincerity*, and even *the self* (and *self-deception*). More distant relations include, as we’ll see, *authority*, *conformity*, *status*, *elitism*, and *classism*. In fact, it turns out that society itself, in its many dimensions, is refracted through this deceptively humble concept of ‘pretentiousness.’ An analysis of it is, therefore, overdue.

What we’ll discover is that pretentious behavior is not only silly, comical, or parasitically elitist; it is, or can be, downright pernicious. Far more common than people realize, it has always served to uphold authority, hierarchy, the status quo, and class stratification. It is intrinsically, and in its social consequences, anti-democratic; it is anti-rational and antithetical to clear communication; it is deeply deceptive, dishonest, artificial, and obscurantist. In its social effects, it is indispensable for giving a patina of dignity to the collective conformism and submissiveness that cohere authoritarian institutions. To the same degree that freedom, reason, and democracy are values to be fought for, pretentiousness is something to be fought against. It will, however, remain widespread until exploitative class structures are themselves eradicated, for, indirectly, they produce it and always have.

To begin, let’s consider some examples of pretentiousness. The Oxford English Dictionary tells us the word means “to attempt to impress by affecting greater importance or merit than is actually possessed.” The buffoonery of intellectuals is an inexhaustible treasure house, a constantly expanding museum, of pretentiousness. From graduate students to senior scholars, from postmodernists to traditional conservatives, from art critics to mainstream “policy analysts,” the glue that holds the intellectual world together is pretentiousness. Public intellectuals sometimes personify the quality. The famous conservative William F. Buckley is the example that comes immediately to mind, with his faux British accent, his semi-aristocratic demeanor, his speaking-through-his-nose, his cultivated self-assurance amounting to pomposity—a clownish smugness, snideness, *smarminess*—his exaggerated use of fancy words, his frivolous treatment of intellectual debate as a game of one-upmanship, and the very aura of decadence and literary-cultural rot he emanated like a fin-de-siècle fascist. He was the epitome of the elite culture Noam Chomsky encountered in his students days at Harvard:

¹ See Susan Sontag’s “Notes on Camp” (1964).

I remember [Chomsky says] there was a lot of anglophilia at Harvard [in the postwar years]—you were supposed to wear British clothes, and pretend you spoke with a British accent, that sort of stuff. In fact, there were actually guys there who I thought were British, who had never been outside of the United States. If any of you have studied literature or history or something, you might recognize some of this, those are the places you usually find it. Well, somehow I managed to survive that, I don't know how exactly—but most didn't. And what I discovered is that a large part of education at the really elite institutions is simply refinement, teaching the social graces: what kind of clothes you should wear, how to drink port the right way, how to have polite conversation without talking about serious topics, but of course indicating that you could talk about serious topics if you were so vulgar as to actually do it, all kinds of things which an intellectual is supposed to know how to do. And that was really the main point of the program, I think.¹

Incidentally, the famous televised debate between Chomsky and Buckley in 1969 on the subject of the Vietnam War (which can be watched on the internet) is intriguing not for the drubbing Buckley received but for its dramatic presentation of the contrast between two archetypes of the intellectual: the perfectly unpretentious, facts-focused, plain-spoken, self-effacing Chomsky and the winking, smirking, joking, performing, prevaricating, *spectacle*-focused Buckley. These two people were inimitable exemplars of the types; most intellectuals fall somewhere in the middle, with at least *some* interest in facts and rationality but with a pronounced predilection for pretense as well. I'll return to this important contrast later.

Just as the political right wing has its pretentious intellectuals, so does the left. Slavoj Žižek exemplifies the latter. One might say that Buckley and Žižek represent two kinds of elite snobbery and decadence, which however overlap and have much in common because ultimately they're part of the same world: Buckley belongs to the crowd of explicit power-worshippers, sycophants, courtiers who hop back and forth between New York and Washington to attend the dinner parties and cocktail parties and lunches with senators—the crowd of “power-loving stablemate[s] of statesmen,” as Arthur Schlesinger, Jr. summarized Alfred Kazin's portrait of him (Schlesinger) in *New York Jew* (1978), as contrasted with Richard Hofstadter's type of “pure, dispassionate, incorruptible scholar.”² (Schlesinger had enough self-insight to recognize the portrait as a faithful one.) Žižek, on the other hand, represents the herd of postmodernist intellectuals, some of whom, like the self-caricature Bernard-Henri Lévy, mingle with the rich and powerful—and most of whom, I suspect, would like to—but who as types are defined by their ostentatious intellectual posturing, their facility for saying something without saying anything, and their basically idealistic (in the anti-materialistic sense) and unrealistic interpretation of the world. Žižek is not as bad as it gets with these people, indeed is critical of some aspects of postmodernism; but his methods, his interests, his ideas and ways of presenting them, and his intellectual progenitors (notably Jacques Lacan) all define him as quintessentially postmodern. To throw together a miscellany of references to psychoanalysis, philosophy, history, religion, literature, pop culture, economics, Marxism, and vulgar *humor* (jokes and anecdotes), and to pretend that something incredibly profound is being said, is to create—to quote the title of one of Žižek's books—a truly “sublime object” of pretentiousness. Whether or not one tries to dignify the product with the term “*bricolage*,” it's clear that what is going on is mere play, not serious or rigorous explanation. And yet thousands of people attend Žižek's talks³ and earnestly take notes, treating with decorous academic seriousness this entertainer and professional provoker-of-liberals. The contrast between appearance and reality is stupefying—a splendid example indeed of “postmodern irony.”...

³ Of which there is an abundant supply on [YouTube.com](https://www.youtube.com).

One can get headaches from loneliness, and alcohol is the only refuge. –No, scratch that; alcohol and Netflix are the only two refuges.

[...]

Civilization is so tired of itself, it's just waiting to die.

–Yes, the world is going to burn. I only wish I had gasoline to pour into the fire.

I was doing research at the University of Chicago library and came across a short case-study of an 80-year-old man applying to something like a nursing home (in the 1930s). Here's an excerpt that moved me to tears (I had to suppress them in the reading room), and made me think of the sadness of life:

When asked about his relatives, he replied, "I have none. They are all gone long ago. I never married. I had a sweetheart but she passed away before the day set for our wedding. No one can take her place."

"Well, will you not be lonely in this home?" he was asked.

"I don't think so. I will enjoy thinking about her while alone in my room, and while I wander about among the beautiful flowers and shrubbery on these grounds. I shall be contented and when I pass on I am requesting my body to be cremated and ashes to be strewn over the hills and valleys where my beloved and I passed many happy hours together."

The caseworker adds a comment: "Mr. Stanley can be found many hours of the day sitting in his easy chair looking out of the window—eastward—reminiscing."

Just think of that. Who knows how many years ago that was, that he was happy with his betrothed, until she died. And now, at the end of his life, his greatest pleasure is to remember her.

Oh, life is just too sad to take.

The year-long sexual dry spell is over, thanks to a 34-year-old Russian, Irene. Saw my profile on match.com and was intrigued that I'm in labor history, so looked me up on Google and found my website, which she liked, and then emailed me through it. I was impressed that a woman had taken such initiative—very few would, in my experience. In the last couple weeks I've stayed overnight at her place a few times, which has given me some blessed sexual relief. Unfortunately I'm not very attracted to her and have decided I don't like her much, so I'm going to end it the next time I see her.

Last weekend met a 30-year-old Indian cog in the corporatocracy (that's her job) who took me to her apartment on the first date, where we did most things except sex. But we have nothing in common—she's a weirdo, asking me how long and wide my penis is and how many women I've slept with, demanding half-jokingly that I drink more and more liquor to demonstrate my masculinity, and generally showing that she has mental issues of some sort—so I ended it today.

More dates coming up this week, probably with more mediocrities.

I'm constantly amazed that 90 percent of what I encounter in society is, from the perspective of both facts and reasonable values, totally backward. Almost hallucinatory. I see leaden feathers and floating rocks.

This whole journal is nothing but me talking to the Absolute. Trying to communicate, impossibly and meaninglessly, with the Objective, because the Subjective all around me is so trivial and unsatisfying.¹

¹ In another sense, though, I *am* the Objective, or rather as close to it as a human being can get (with the exception of Chomsky, as usual). In Hegelian language, I am alienated Spirit struggling (hopelessly) to coincide with its universal self and overcome its alienation.

November, December

35 years old. Life is surreal. Someday I'll be 50? And then 70? That's terrifying.

I remember when I was 17 and tortured by all that adolescent self-examination. And now here I am, 17 years later. In a sense, it seems like not a lot has happened since then, even though everything has. Those distant years feel strikingly close to me still. —Life is both very short and very long, somehow.

I suppose I was destined never to be well-adjusted, even if my life had gone differently. I'd still be essentially who I am. It's true I've made mistakes—attending a small private university, going to Korea and not Europe or Latin America, spending too much time in the barren Midwest, not living in New York City during my twenties—but really, the open wound is time itself, or the very structure of my consciousness.

It's an incredible privilege to be alive at this moment in history. Hundreds of thousands of years, but it's *now* that I'm alive, just as everything has become perfectly clear and everything is about to collapse. Had I lived any time in the past, I likely would have been the victim of revolutionary illusions and idealism, and disappointments; it's only in the neoliberal era of capitalism that the trajectory and meaning of history, especially modern history, has truly revealed itself, and illusions are impossible (for me). Not only that, but I get to see civilization begin its ultimate implosion. I get to see the middle class of mediocrities disintegrate, and Western society begin to receive its comeuppance. The tragedy, of course, is that the global South will suffer more than the North. But hey, at least this time there will be some backlash onto the U.S. New York? Gone. Boston? Gone. It's awful, yes, but it's "sublime," in Burke's sense. Terrifying, awe-inspiring, God smiting the world for its evil. The Reckoning is upon us.

Why are there so many men in the U.S. filled with rage against women? Why so much hatred? It's all over the internet! What explains it? The misogynistic video game culture has something to do with it, but let's ignore that. It's not very interesting. The more general reason, I suspect, is rooted in sexual frustration and loneliness. To speak bluntly, it angers men that these "silly little creatures" (as they're seen), giggly and childish and weak, have the temerity to reject them, and are constantly getting their way. It's an insult to their manhood! What a farce, when women have so much more power than men! That's the thinking. Men watch porn, watch movies, watch TV shows, see women on the streets giggling with their girly friends, are inundated with the message that women are little more than pretty objects with consciousness, passive children who exist but for sex and to please men, and the gigantic contradiction is just too much to take. "How can *these* people have more power than *me*?!" many men think. "How can *they* be the ones who say Yes or No?! And then they have the audacity to complain about how *men* treat *them*! While we men are forced to gaze longingly from afar as they taunt us and tempt us and have to satisfy our needs by jerking off every night!" Etc. Those, I suspect, are the (very one-sided) feelings motivating a large proportion of internet misogyny.

Anyway, it's sad. The war between the sexes will never end.

Luckily it doesn't affect me much, for I have my Bach. My Absolute. My Bach is my rock.¹

Thoughts on thinkers: Descartes had world-historical significance insofar as he was the most perfect manifestation of modernity's impulse to reject the past and begin anew, in a rational and scientific way. Kant was significant inasmuch as he was the highest expression of the Enlightenment, which itself was the highest cultural expression of the characteristic spirit of modernity in its *positive* aspects, namely its valorization of individual creativity, inquiry, freedom, reason, science, anti-traditionalism, and humanitarianism. (Hitler personified its *negative* aspects, which are the negations of its positive ones: bureaucracy, centralization of power, suppression of individuality in the mass, hostility to inquiry and

¹ I continue to think that the trio with the oboe and horns near the end of the last movement of the First Brandenburg Concerto is in the running for the title of Noblest, Most Virile Musical Fragment Ever Written. And certainly Bach's oeuvre is the noblest, most virile ever.

reason, cruelty and violence, and reaction against popular empowerment.) Hegel had world-historical significance inasmuch as he was the first, and alienated, expression of the characteristic *self-consciousness* of modernity, and of its historical sense. Marx had a dual significance insofar as he (1) un-alienated this self-consciousness and historical sense by turning it right-side-up (giving history a largely correct interpretation), and (2) gave highest expression to the movement for popular emancipation—most deeply, class emancipation—that has driven modernity upwards. Schopenhauer was a minor thinker who gave philosophical expression to the parochial and alienated self-consciousness—the Romantic self-justification—of one characteristic stratum of modern society, viz., its isolated, discontented, anti-mass-society, and self-intoxicated artists and intellectuals. Nietzsche and Freud were two expressions of mature modernity’s alienated preoccupation with (1) the irrational and destructive forces of the human personality, (2) the relativism of values and essential meaninglessness of life, and (3) the individual self itself, especially in its unconscious self-determination. Kierkegaard and Sartre (both arguably minor thinkers but of some world-historical significance) were two opposed but, in a sense, complementary expressions—one religious, one atheistic—of the modern self’s anxiety, its anguished anomie and freedom from external and internal controls. Chomsky is of universal significance in being the highest and most consistent personification of every Enlightenment value, and thus the ultimate model of how to live.

(As for me, I represent the perseverance of Spirit and the Individual in a time (soon) of world-despair and the decay of civilization, a time of mass anonymity, mediocrity, and futility. I am humanity’s, or the self’s, final tragic and defiant affirmation of itself despite its history (for I identify with history, and its weariness is mine). At the same time, I’m humanity’s final self-reflection before it falls into the chasm that separates its past from...whatever lies in its future.)¹

I could add a lot of other similarly “symbolic” figures, such as Rousseau, Bakunin, and Foucault (of semi-decadent significance), but you can imagine what I’d say.

According to the newspapers, Republican elites are starting to take seriously the possibility that Donald Trump will be the party’s nominee for president. He doesn’t seem stoppable, for the crazier are his statements, the more popular he is with the base. Many are expecting a debacle in the general election. All this I find pretty amusing, and reminiscent of the Hitler phenomenon. In the 1920s business and political elites in Germany not only tolerated but helped stoke the atmosphere of nationalism, racism, and imperialism, and to some extent subsidized the Nazis and other such groups. They created the possibility of Hitler, for his anti-Communist, anti-labor movement was useful to them. But then the Nazi Frankenstein to which they had helped give life conquered enormous power and had to be brought into the government, where eventually they lost control over it. In a similar way, the updated fascism that has been concocted in, and broadcasted from, the conservative public-relations industry over the last forty years has finally created a Frankenstein “movement” that is taking over the Republican party. The elites are losing control, and the whiff of totalitarianism (deporting 11 million immigrants, banning Muslims from entering the country, etc.) is in the air. What the upper class sowed, it is now reaping. Luckily the majority of Americans are still relatively sane, and progressive movements are picking up steam, so the general population probably won’t reap the whirlwind.² [Whoops. Too optimistic there!]

Listening to Mozart, I realize that I should be grateful for most things that have happened to me, even the apparently bad things. For example, not having more long-term girlfriends in my twenties. Women can drag a creative person away from his creativity and away from himself. It was a blessing to be semi-

¹ Such megalomania is always half in jest. Incidentally, it’s true that the first paragraph is kind of obvious, but it’s interesting to adopt something like Hegel’s perspective on himself and on other modern thinkers, and to use this to explain why they’ve resonated so much.

² Intellectuals live to make fine distinctions and so are insisting that Trump is nothing like a fascist, etc. Intellectuals also live to miss the underlying essence of a given phenomenon. There are obvious differences between the fascism of the 1920s and ’30s and the Trumpian Tea Party phenomenon (and other such things in Europe), but there are also telling similarities.

ignored by females, an incredible stroke of luck. I wasn't burdened, I could listen to music when I wanted and write when I wanted and be free, and live beautiful moments without the pollution of another person sharing them. I've tended to think that not to share is not to live—and from one perspective there's truth to that, but not from all perspectives. In a sense I've lived more deeply because I haven't shared, or because I've shared only with myself. That's a kind of sharing too, maybe the most profound kind. I can look back on my youth with fondness mainly because I shared that time with myself and so truly experienced it in all its sadness and hope, and learned to love myself as I am and enjoy life on my own terms. I became myself with myself and no one else. [Well, that's an obvious exaggeration. I shared lots of wonderful moments with others.] The past *did* happen, it *is* worth remembering, it's worth loving for the countless moments of love I experienced, mostly love of myself and of music and life and solitude. I can actually look back fondly as lovers look back on their time spent together, for I was my own soulmate.

Chuck Mangione's great song "Bellavia." And "Feels So Good." Laid-back love of life. Two great dates recently, one with a professional actress and another with a soon-to-be nurse practitioner (Jane, intelligent Jew). Was more excited after each than I've been in a long time, and liked both girls much more than any other in a long time. The actress is away a lot of the time, but I should see her soon. Kissed the nurse at the end of the date tonight. Quite possibly nothing will happen with either of these women, since nothing ever does, but for now I'm just enjoying the mellow semi-hope.

Life goes on, and on. Incredible, time.

My whole life, I've wanted *one* thing: domestic bliss. Texting Jane and remembering the pleasure of our date, the artist in the back of my mind whom I try to lock away in the basement draws pictures, sneakily, of us sitting on a couch listening to music, my arm draped over her shoulders. And then she's in the kitchen fixing a snack as I...what am I doing?...I'm behind her hugging her, kissing the back of her neck.

—Sorry, it's the sentimental music I'm listening to.

Oy, want to see her again. Keep thinking about her, against my better instincts. These midnight moods ambush me most nights, but this time there's a specific person.

...Ugh, she's spending this whole week at Joshua Tree, so it'll be almost two weeks between our first date and our second. At least I can see her before going back to Rhode Island for Christmas. But I'm impatient! Haven't been this hopeful in a very long time.

Have started going back to the gym, partly because of her but also because it's satisfying (I'd forgotten), especially now that I have an iPhone and can listen to good music.

...Well, it seems that pessimism isn't always justified. The second date went well, and she came back to my place and spent the night. Wonderful girl, lover of laughing and intelligent talking and apparently even my quirky goofiness. Lovely face, body, and soul. Seems almost too good to be true. I hope I don't screw it up.

In my dissertation so far I've been rather tame, rather academic and conventional, not even mentioning Chomsky, for example, at all. Correspondingly, I've been somewhat bored with the whole enterprise. But just had an epiphany, in the context of interpreting the significance of gambling for men in homeless shelters (who very much enjoyed to gamble): fuck it, I realized, let's take the gloves off and let loose—to hell with propriety—and bring in some Chomsky on sports. I can apply his interpretation of spectator sports to gambling in the 1930s, as a way to revalue values and raise up the homeless and the poor (gamblers) to a position of dignity. That's basically the whole point of my dissertation, after all. And if I let myself stray from the academic script throughout the whole book a little more than I've been doing, and be even more partisan and Marxian and Chomskian than I've been, I'll be more interested in the thing.

If you're curious, here's what I just wrote:

...Thus, even after the creation of the Special Activities Department, the principal forms of recreation remained extra-institutional and anti-institutional, the activities most conducive to

escape from collective anhedonia: drinking, gambling, and visiting prostitutes. In a viciously class-structured world, these were what was left those on the wrong side of the divide. Considered vices by mainstream society, their popularity among shelter inmates—especially the Hobohemians, who were more familiar than the others with gambling and prostitution—was emblematic of these men’s extreme dis-integration from dominant ideologies and ways of life, bourgeois proprieties and hypocrisies. They chose their own path, adapting and resisting at the same time.

Gambling, for example, was far more than an act of desperation or despair: as with the African-American community on the South Side that was discussed in the last chapter, it was a positive source of excitement, hope, and intellectual stimulation, as well as an implicit rebellion against the deadening influence of the shelter bureaucracy. In interpreting the significance of gambling for these men—and thousands of them, Americans and immigrants, enjoyed it and actively sought it out—one recalls Noam Chomsky’s remarks on spectator sports in contemporary society: one reason for the incredible popularity of sports, and the enormous amount of attention and analysis that people regularly devote to them, is that most other avenues for the exercise of collective intelligence are closed to the public. To quote Chomsky,

In our society, we have things that you might use your intelligence on, like politics, but people really can’t get involved in them in a very serious way—so what they do is they put their minds into other things, such as sports. You’re trained to be obedient; you don’t have an interesting job; there’s no work around for you that’s creative; in the cultural environment you’re a passive observer of usually pretty tawdry stuff; political and social life are out of your range, they’re in the hands of the rich folk. So what’s left? Well, one thing that’s left is sports—so you put a lot of the intelligence and the thought and the self-confidence into that.¹

If this is true—and it rings true—of many people in contemporary society, it was much more true of shelter men in the 1930s, except that for them the outlet for creativity, intelligence, and thought was *gambling* even more than sports (although many retained their interest in spectator sports after entering the shelter, and every day read the sports section of the paper). They had been exiled from social, political, and cultural life, and had to endure the institutionalized suppression of their personalities every day, so they enthusiastically embraced gambling as one of the remaining means of expressing themselves and resisting the complete extinction of their identity. “The gambling habit has been accentuated since shelter entrance,” a researcher writes in 1935. “The men are necessarily limited to small stakes, but they express as much enthusiasm and use as much energy in their gambling as do the patrons of expensive gambling houses.” Card playing and, especially, betting on horse races were the most common activities, the latter being done either among the men themselves—betting with razor blades, cigarettes, and other small items—or at cheap gambling joints on West Madison Street. The researcher goes on to give testimony that supports the Chomskian interpretation:

The men consume much time and energy in doping the races. They pour [sic] over racing literature and racing results in the newspapers and talk for hours on the relative merits of the various horses, the ability of certain jockeys, the condition of the track, the crookedness of the stables and jockeys, and the odds on the horses. On the basis of their reading, conversation, and knowledge of the races, even though they may have little or no money to bet, they have a great time doping out how one should place his bets.²

¹ Peter Mitchell and John Schoeffel, eds., *Understanding Power: The Indispensable Chomsky* (New York: The New Press, 2002), 99.

² Sutherland and Locke, *Twenty Thousand Homeless Men*, 122, 124, 125.

Clearly this so-called “vicious,” and illegal, activity was not engaged in solely for acquisitive purposes (as rational as those were), but also for “creative” purposes. As in the case of policy [a type of gambling] among African-Americans, elaborate systems were devised for placing the right bets. For some men, gambling became an obsession. “Such men eat horses, sleep horses, and talk horses all day long”: in fact, the races gave them a reason to live. What is just as striking as the intellectual energy they, and others, devoted to gambling was the astonishing persistence of *hope* among men who usually lost, the invincible conviction that sooner or later they would have a string of successes and accumulate enough money, perhaps, to leave the shelter. After years of unconsummated job searches and the humiliations of shelter life we have described in this chapter, hope’s last refuge lay in gambling. “If it wasn’t for the fact that the pony players always hope and constantly look for a future change in luck,” a shelter inmate observed, “many of them would commit suicide.”¹

Thanks, Noam!

By the way, I was pleased to come across today the following exchange in an old interview with Chomsky, which says basically the same thing I wrote in my review of the book *Tensions of Empire* years ago:

Question: But you're often accused of being too black-and-white in your analysis, of dividing the world into evil élites and subjugated or mystified masses. Does your approach ever get in the way of basic accuracy?

Answer: I do approach these questions a bit differently than historical scholarship generally does. But that's because humanistic scholarship tends to be irrational. I approach these questions pretty much as I would approach my scientific work. In that work - in any kind of rational inquiry - what you try to do is identify major factors, understand them, and see what you can explain in terms of them. Then you always find a periphery of unexplained phenomena, and you introduce minor factors and try to account for those phenomena. What you're always searching for is the guiding principles: the major effects, the dominant structures. In order to do that, you set aside a lot of tenth-order effects. Now, that's not the method of humanistic scholarship, which tends in a different direction. Humanistic scholarship - I'm caricaturing a bit for simplicity - says every fact is precious; you put it alongside every other fact. That's a sure way to guarantee you'll never understand anything. If you tried to do that in the sciences, you wouldn't even reach the level of Babylonian astronomy.

I don't think the [social] field of inquiry is fundamentally different in this respect. Take what we were talking about before: institutional facts. Those are major factors. There are also minor factors, like individual differences, microbureaucratic interactions, or what the President's wife told him at breakfast. These are all tenth-order effects. I don't pay much attention to them, because I think they all operate within a fairly narrow range which is predictable by the major factors. I think you can isolate those major factors. You can document them quite well; you can illustrate them in historical practice; you can verify them. If you read the documentary record critically, you can find them very prominently displayed, and you can find that other things follow from them. There's also a range of nuances and minor effects, and I think these two categories should be very sharply separated.

When you proceed in this fashion, it might give someone who's not used to such an approach the sense of black-and-white, of drawing lines too clearly. It purposely does that. That's what is involved when you try to identify major, dominant effects and put them in their proper place.

¹ *Ibid.*, 128.

Yup. Far from having deeper understanding than someone like Chomsky, as they think, humanistic (especially postmodernist) intellectuals have essentially *no* understanding, because they don't acknowledge the relative validity of generalities, which are the very stuff of understanding. You explain things on the basis of a necessarily simplifying set of principles; that's what understanding is. What you get with most mainstream scholarship, though, is little else but "Reality is complicated, and here are some things that happened." The moment you try to explain anything in terms of economic power or structures, you're attacked as being a simplifier or a polemicist, not a scholar.

I plan to use that interview excerpt in the introduction to my dissertation, where I'll argue for the overwhelming importance of class.

January–May, 2016

Reading parts of a collection of essays published in 1978 called *Anarchism*, edited by J. Roland Pennock and John W. Chapman. Pretty good philosophical essays, but I have to say that what I've seen of the literature on anarchism leaves much to be desired. Actually, the whole universe of anarchism, with all its different strains and movements and doctrines, is messy and full of confusions and oversimplifications. Basic concepts like domination, power, hierarchy, authority, freedom, and coercion are often left unclarified and essentially unanalyzed. We don't need Foucault to tell us that life is ineluctably infused with domination and authority, that constitutive of every situation, of the psyche itself, are elements of power and imperceptible forms of coercion. The self is formed through contact with authority, parental authority and peer pressure and hierarchies of power and status, and these remain embedded in the self throughout its existence. The social world itself becomes a dominant Other that confronts the self, and in relation to which the self is always defining itself. Its internalization is an authority that's *part* of the self, such that a relation of power and subordination is written into the very structure of the self. In every situation there are dynamics of power operating on the psyche and influencing, partly coercing (pressuring and determining), one's behavior, whether in the context of a romantic relationship or a social gathering or a meeting between anarchist activists. Even in tribal societies or the most egalitarian commune, inequalities of status entail inequalities of power, "unjust" forms of domination and restrictions on individual freedom. People are constantly competing, even unconsciously, for higher status and more power. Social structures of unequal power and freedom, hierarchies of subordination, define even worker cooperatives and relatively egalitarian municipal governments. There is both "top-down" and "bottom-up" authority in certain modern democratic institutions, and it seems inconceivable that this could ever change in any organization that consists of more than a few people. Someone with greater expertise will tend to have more power; elected representatives, even in a dramatically different political and economic environment than the present, will tend to have more influence and status, and thus more powers of domination and coercion (at least emotional coercion or rhetorical coercion or the coercion of "charisma" or whatever), than someone who is more unknown—or considered less intelligent or knowledgeable, etc. Even if society were organized according to decentralized workers' federations, dispersed "democratic" units of local economic and governmental power, the necessity of complex institutions to coordinate and distribute resources would inevitably breed elements of top-down power and domination, probably including implied threats—and in some cases the reality—of physical coercion if orders were not followed.

In intimate relationships, particularly in families and between lovers, not only are unequal power relations inevitable (although which side is favored by the inequality may vary between situations, from day to day, and between periods of life); they are, in some respects, good. As I've said, the greater authority and power of parents is integral to the formation of a child's healthy sense of self. But also, there are clear tendencies for women, especially younger women, to prefer that the man they're united with have greater power and dominance (physical strength, height, emotional strength (in a sense), intellectual strength, financial strength) than they themselves, because this is what attracts them to a man.

And of course it's easy to imagine innumerable situations in which even physical coercion is necessary and good, justified by appeal to some higher value.

In short, life is messy. “Autonomy” has a sort of intuitive meaning and validity as a moral ideal, but none of these abstract concepts that anarchism defends or attacks has a precisely definable denotation, since we all exist in an incredibly thick mesh of relations and relationships characterized by indefinitely many degrees of coercion, power, autonomy, hierarchy, status, etc.—emotional, physical, intellectual, political, economic. And many of these inequalities are inseparable from what it means to be a self, and are good and necessary. Nature, which is to say the human condition, cares little for the moral absolutes and oversimplified conceptions of classical liberalism (i.e., in its core, anarchism).

Nevertheless, as a general guide toward action and values, the basic intuitions of anarchism are essential. For they’re little else but manifestations or corollaries of the basic intuitions of morality. We should always be skeptical of inequalities of power and status; and if they can’t be justified, we should always do what we can to dismantle them, to the extent possible. We should always strive to respect the dignity and freedom of others, and to heed the twin authorities of reason and morality more than any other authority. To the degree that makes rational and moral sense, treat everyone, including children, as an equal.

Now reading Paulo Freire’s famous little book *The Pedagogy of the Oppressed* (1970), which is apparently required reading for leftist intellectuals. It’s overrated. Repetitive, derivative (of Hegel, the early Marx, Sartre, Erich Fromm, etc.), and full of verbiage, albeit inspiring and enlivening verbiage. It consists of little more than eloquent and verbose elaborations (and semi-philosophical justifications) of humanistic common sense about what is entailed in a good education. It’s useful, though, in vividly driving home—through repetitiveness—humanistic conceptions of what it is to be a good teacher. The obsessive emphasis on the *participation* of students, on the need for dialogue, on the necessity to break down the hierarchy, or “contradiction,” between teacher and student, on the importance of taking into account students’ interests and backgrounds in designing (or *collaboratively* designing, with them) a course, on the constant imperative to facilitate students’ creativity and critical thinking—all of this in the service of furthering the subversive, liberating thoughts and practices that can bring about a social revolution—helpfully focuses an educator’s energies.

Along the way, Freire introduces pretentious technical concepts like “limit-situations,” “limit-acts,” “generative themes,” and “decoding,” concepts that give intellectuals something to play with and write articles about. (Ironically, in light of Freire’s educative purposes, these concepts of his are quite elitist, in demanding a specialized vocabulary inaccessible to the ordinary people he wants to empower. Moreover, they’re unnecessary and don’t really aid understanding.) More useful is his (unoriginal) classification of educational styles into two categories: the usual *banking* model, involving the “depositing of files” and storing of static information in the student’s passive mind, and the *problem-posing* model, which is more interactive, directed toward solving problems of life and understanding that confront the student. This latter model is reminiscent of the way I decided a while ago I’d like to organize history courses: namely, spend the first week or so discussing where society is in the present, how the political economy is structured (and relating this to the students’ own experiences), and then spending the rest of the semester discussing how we got to this point—and, ideally, what lessons history tells us about how to move forward in a constructive way. If you want to get across to most people, you have to relate a course’s subject-matter to their own interests and backgrounds. Very few teachers do this.

Much of what Freire says, especially in the penultimate chapter, relates to teaching illiterate peasants in Latin America and is of no direct relevance to educators in the U.S. But his methods of teaching peasants are interesting. I suppose his abstruse concepts could be helpful guides to interacting with these people, to deciphering their views and facilitating dialogue.

This whole participatory model of education, by the way, can easily degenerate into flaky political correctness—listening to and respecting all viewpoints in the classroom, insisting that every opinion has value, being ultra-careful not to offend anyone, letting students’ subjective preferences and neurotic sensitivities guide the direction of the course. In small groups it could degenerate into a sort of group therapy. No one with his head screwed on could deny that in modern urban education the teacher should be the clear authority, should be the one to determine the content of the course (while soliciting students’ input and considering their backgrounds, etc.). It isn’t the *authority* principle—the teacher/student “contradiction”—that is the main thing to be remedied; it’s the fact that most teachers are conventional

spouters of conventional doctrines who don't challenge students' conventional understandings. Presenting alternative, and *true*, left-wing perspectives in an engaging way, while simultaneously providing opportunities for students to participate and to create, is the formula for success.

As you know, I tend to be critical of intellectuals. I have to admit, though, that there's something moderately impressive about being able to engage in self-initiated intellectual work, especially if it's sustained over a long period. It's a solitary, laborious, and often tedious process for which very few people have the capacity. Even fewer, however, have the capacity to do it *well*, in a critical, challenging, and courageous way.

Reading Eduardo Galeano's magnificent *Open Veins of Latin America: Five Centuries of the Pillage of a Continent* (1973).

Good observation by Bertolt Brecht: "In democratic countries the violent character inherent in the economy doesn't show itself; in authoritarian countries the same holds true for the economic character of violence." (Quoted by Galeano in the context of Pinochet—the pro-capitalist character of his violence.)

Well, I was an idiot for thinking that pessimism sometimes isn't justified. If you're me, it's always justified. Jane doesn't feel the "spark," and, to be honest, I'm not sure I do either. It was there the first two dates, but the second two it wasn't. All in all, though, I'm sick of being alive. Don't know how much longer I can tolerate being alone. Something has to change.

...I feel as though I've reached a crossroads of some sort. I can't go on. I need a woman; I need love. I can't function. Should I use an expensive matchmaking service? But it's Chicago: I doubt I'll find someone worthy here. I should be in New York, or I should have lived in New York in my twenties. What a colossal mistake. I ruined my chances for happiness. What am I going to do? How can I find love? I'm 75 years old, I don't have much time left. But I was cursed to live on a different plane than others, already in an otherworldly state at the age of 75 when I'm still living. I observe the world and don't participate in it. I'm not of the world—I don't belong among people. So how can I find a human companion? What am I going to do? I can't be alone any longer.

...Spent a night with a girl, which was nice—large breasts and wet vaginas, all joys are due to you (to quote John Donne)—but she's already seeing someone and I'm not very interested in her anyway. Have a couple dates this weekend. Ugh.

...Dated a 28-year-old black girl named Merissa for a month, an intelligent and creative person, strong and self-assured, with many interests and ambitions. But not at all thin, and too self-preoccupied in her conversation. (Incidentally, I discovered that sex while high on pot is amazing.) Went to a therapist a couple weeks ago but it was silly, more like *his* therapy session than mine, and anyway I'm too intelligent for therapy and don't really need it. Had a session with someone else today, and she was better, but I'm still inclined not to keep it up. I can anticipate and see through everything these people say. Don't even need that kind of emotional reinforcement, since I'm already in awe of myself and basically have no problems with who I am.

Emailed Dad in response to a video he sent me of some famous academic idiot named Jerry Coyne talking about free will:

Jerry Coyne does not impress me, although at least he seems less stupid and annoying than Dennett. Surely he's right to be an incompatibilist, since the idea of self-control (free will) manifestly contradicts the idea that one's acts are determined by factors outside one's control, such as environmental stimuli and neural impulses. That sentence, in fact, is almost all that's needed to dispel the entire controversy and the entire literature over compatibilism vs. incompatibilism. Some of his other points are less convincing, though. For example, as Chomsky has noted, the fact that, with the help of MRIs and whatnot, a person's next act can theoretically be predicted a second before he does it technically doesn't invalidate the notion of free will. All it entails is that decisions

are unconscious, and then bubble up into consciousness. But, in effect, we already knew this--we already knew that there's an unconscious and/or "pre-conscious" (in Freud's terminology) realm out of which a given conscious state emerges, frenetically churning with all sorts of mostly unactualized possibilities. It may be that if a decision is unconscious we shouldn't really say it's under our control and thus subject to free will, but that's a separate issue.

There's something naive about Coyne's whole presentation (which, incidentally, showed not a particle of originality). He doesn't seem to recognize all the logical and psychological problems involved in an abandonment, even if only an "intellectual" abandonment, of the belief in free will. But first, he's right on one obvious point: even if determinists succeeded in convincing everyone that free will is an illusion, this would have no very bad social consequences. Only a naive idealist/"intellectualist" about human behavior, like a Dennett, who ludicrously overestimates the social importance of abstract reflections, could think that people would suddenly start behaving differently, even immorally, if they decided that free will is an illusion. "Noble lies" like God or free will or whatever are not what regulate social behavior. Institutional norms and power-structures are, in addition to elementary psychological facts like the desire for approval from others.

But Coyne is blithely unaware of more serious problems. Do we really want no longer to *blame* people (in the "morally responsible" sense), or to think that no one is robustly responsible for his acts? He says, like a 15-year-old who has just started reading philosophy, "I was full of regret for the way the relationship with my ex-girlfriend ended, but then I remembered, oh hey, I don't have free will, so it couldn't have gone any other way! It had to end as it did, and so I lost my regret and felt better about myself." Simple as that, eh? Moron. You can't so blithely do away with the absolutely overwhelming, in fact *immediately certain*, impression of free will. I'm *choosing* to write right now instead of going outside to the grocery store. It seems inconceivable for this impression to be wrong. In a sense, *what would it mean* for it to be wrong? That possibility doesn't really make any sense. Now, given the truth of determinism, it seems that in some way it *must* be wrong--free will must be an illusion--but *how* it can be wrong is impossible to imagine. Both free will and determinism seem absolutely necessary. So Chomsky and McGinn and the "new mysterians" are right that our cognitive apparatus is inadequate to tackle the mystery of free will. The paradox is unresolvable.

But getting back to the problems with Coyne....our impression of free will is so fundamental to who we are, and so apparently certain, that it's much too easy and simplistic to comfort ourselves with the supposed fact that we have no control over what we do. As far as we know from our inner experience, we *do* have some large degree of self-control. A person's decision to behave a certain way with his girlfriend is very different from the case of the mentally deficient criminal who is acknowledged to have less control over his acts than normal people. (And yet Coyne compares the two situations, saying, in effect, that we're all like the criminal.) And after all, maybe, in some unfathomable sense, our impression of self-control is true.

In any event, as Kant said, it's impossible not to act without implicitly presupposing free will. We have to keep thinking of ourselves as free beings--subject to many constraints, of course--and evaluating ourselves and our acts on that basis. Coyne doesn't have the right to excuse his past behavior by invoking the supposed falsity of free will, partly because that is to abandon his whole identity as a human being, and partly because as far as he was concerned at the time he *did*, after all, make decisions, and--according to his own consciousness--he could have made different decisions. And also, again, it's possible that in some sense that humans are incapable of conceiving, some sort of determinism and some sort of free will may be compatible, such that we're right in believing ourselves to have free will.

Nor does Coyne recognize that some of the objections to his view he mentioned are right. For instance, he says that people who don't believe in free will are not being inconsistent in trying to convince someone of a particular view, because, after all, environmental inputs are in part what determine how people act. So the inputs we give people through our arguments may somehow result in the rewiring of their neural pathways or whatnot, which will maybe lead them to change their mind. But the whole point of the objection, which he doesn't recognize, is that it's inconsistent for a non-believer in free will to appeal to a person's *reason* and try to change his mind thereby, because the essence of reasoning is that one (*freely*) considers alternatives, considers reasons, and (*freely*) decides between them. (The element of freedom is implicit in the very concepts of considering and deciding, which means it's implicit in the concept of using reason.) So, by presenting a logical argument, Coyne is implicitly presupposing that his audience has free will, i.e., can freely consider alternatives and decide for or against them. He may rationalize his behavior by saying, "No, I'm not actually trying to convince you on the basis of your use of reason but rather by manipulating you in a non-rational way to come around to my views"--which, in effect, is what he says--but that's a superficial rationalization that conflicts with the spirit of his activity, the *rational* spirit. In short, a non-believer in free will is constantly, in fact in every second of the day, faced with the contradicting of his determinist views by the premises, or the "spirit," of his actions. The contradiction is only extra pronounced in the case of the determinist who is engaged in reasoning, or in trying to convince someone else of a position by presenting him with reasons (as opposed to manipulating him in some way, emotionally or physically or whatever).

Reason really is the realm of freedom. The old philosophers were right about that. That actually poses another problem, namely what the relation between reasoning and free will is. In a way we're less "free" when under the influence of a powerful emotion. But this apparently has to do with a different sense of free will than the one Coyne is discussing, according to which all our acts are free.

Anyway, I guess that's enough for now. Gonna get back to the dissertation. Good luck with the talk! (if you give it)

Once again, I've become disgusted by my ignorance of intellectual matters. I don't see why I have to force myself to read only history if I get tired of it. I'm gonna read whatever I want to read. So, I'm starting with the history of cognitive psychology and cognitive science, which I know little about. *A History of Modern Experimental Psychology: From James and Wundt to Cognitive Science* (2007), by George Mandler. Also John Greenwood's 1999 paper "Understanding the 'Cognitive Revolution' in Psychology," and several other papers.

... Well, I guess I can't justify continuing this reading. So, back to history. Martin Comack's little book *Wild Socialism: Workers Councils in Revolutionary Berlin, 1918–21* (2012). Among others.

4:00 a.m. Insomnia, as usual. Schubertian *moments musicaux*. Thoughts of women—which never really leave my mind, to be honest. They're always there, in the back. A woman, a petite woman in her late twenties, lying next to me, naked... would be nice. A sweet and devoted, intelligent and kind, pretty young woman, who could restore a broken person to health, nurse him back to youth. Just someone to hold and love, and maybe make love to gently and slowly.

So many beautiful women in the world, and I'm stuck in Chicago.¹

Women, marvelous creatures. Such perfect embodiments of a beautiful principle. The divine fusion of adult and child, of reason and feeling. Sweet devotion, sweet immersion in the moment. —I just like writing words, so I can savor the thought of women. A mood craves expression, a love craves expression.

¹ When I compare women on Tinder in Chicago to those in New York, the difference in quality—in attractiveness and apparent intelligence—is astounding. It's fatties, uglies, and dull-eyed bimbos versus incredible hotties.

And yet this mood is not so bad, this melancholy—poetic, a dream of philosophic love. (Thank you Francis Bacon, and Franz Schubert.)

There's a sense in which activists who don't belong to the group on whose behalf they're fighting are on a higher moral level than those who do belong to that group and engage in resistance. For the latter's actions are *slightly* more self-interested than the former's. The former person wants to help others, the latter to help both himself and others. But of course this distinction is somewhat artificial and contrived.

The human abortion Antonin Scalia died today. Here's the last word on him, from my Facebook status-update: "Lest we forget what a troglodyte he was, here's a small sampling: [link to an article]. To use the lingo of Lenin, Scalia was little more than a useful idiot—from the perspective of the most reactionary sectors of the 'ruling class.' His sort of conservatism, while full of intellectual pretensions, is nothing but a tool of those whose interest is in fighting, or rolling back, the expansion of freedom and democracy to the historically disenfranchised. It's a useful 'intellectual' mask for the agenda of bigotry and repression." Then added a comment: "He was an atavism, more appropriate to medieval times than postmodernity. Would have made a better Grand Inquisitor than Supreme Court justice." Given his extreme Catholicism, his obvious fixation on sin and human weakness and the imperative of purity and so on, that's literally true.

It might not be totally absurd to say that I'm the first true Marxist ever, or at least the most Marxist Marxist. The person who has most absorbed its logic, for example in the revisions I've made to the system. And in my instinctive anti-intellectualism, anti-elitism, anti-subjectivism, and anti-voluntarism. But it's true that others come very close, such as Chomsky.

Sent Mom an email in a corny and half-drunk mood a few nights ago; here's the relevant part: [deleted]. She was happy about that ("Chris, these are the sweetest, most loving words I've ever received from you and I will always cherish them"), since I'm never corny like that with the parents. I was in a forlorn, anguished mood and was grateful to receive a sweet email she'd just sent.

Incidentally, for the last few days I've been strangely bothered by the knowledge that despite four years of closeness and mentoring, I apparently mean nothing to Lulu. Every so often I still text her, and she replies perfunctorily. Those two ice queens, she and her mom, live only a few blocks away, but I haven't gone over there because I don't want the mom to make a scene. It is hurtful, though, to be ignored after such a close and long relationship.

Wrote an article for an organization in Chicago that does work with the homeless and unemployed. They wanted me to draw on my research somehow. (For some reason the footnotes were deleted when I copied-and-pasted it here.)

Homeless in Chicago: Echoes of the Great Depression

It is a sadly obvious fact that our country is at a stage comparable in many respects to both the late 1920s and the 1930s, during the Great Depression. Economic stagnation, income inequality, high unemployment (as of February 2016, 10.1% or 14.7%, [depending on the source](#)), and increasing homelessness are only a few of the parallels between that earlier time of despair and our own.

The rise of demagoguery and bigotry in our mainstream political discourse is another clear analogy, reminiscent of demagoguery in Europe during the Depression.

So it may be of interest to recall conditions in that earlier time, since things are likely to get worse in the coming years. As a historian who has studied Chicago's public homeless shelters in the 1930s, I'd like to consider that topic here.

Some readers may, perhaps, recognize similarities between what I'll describe and what they have personally experienced.

In 2014, a "point-in-time" count of Chicago's homeless population found 5,329 people in shelters and another 965 unsheltered residents. But according to the Chicago Coalition for the Homeless, there are in fact 64,000 homeless adults, 48,000 homeless children with parents, and 12,000 people younger than 21 without parents or guardians. (These numbers include people without a permanent residence who live with friends or relatives.)

Compare that with the 30,000 to 60,000 homeless residents who were in Chicago at any given time in the late 1920s, when the city had about 300,000 more people than it does now. Or, even more tellingly, compare the 5,329 in shelters on one night in 2014 to the 20,000 who coursed through shelters the entire *month* of February 1932, in the depths of the Depression.

These figures are ominous.

Even more ominous, though, is the fact that homeless shelters have been closing in recent years, as government funding has become less reliable. For example, the North Side Housing Shelter [closed](#) in November 2010; Catholic Charities [closed](#) two family shelters in the summer of 2015; and the New Life for Men shelter is [currently closed](#) because of funding cuts.

In our present political environment, [such trends](#) are likely to continue. And conditions in shelters are likely to worsen, as the few that remain open become overcrowded. Like they were in the Great Depression.

*

Conditions in most shelters (particularly for men) during those years were abysmal, and give us evidence of how harmful "austerity" politics is to the poor.

One man who had found it necessary to apply to a shelter in 1935 described it as follows:

Here [in shelters] privacy is a forgotten word. On a cold or rainy day, or during the evenings, men are crowded into the basement or assembly room—German, colored, Pole, Greek, Mexican, American, Irish, Russian, and every nationality... Here also are degenerates, drunks, working men, bums, clerks, old men with all ambition gone, young men whose every ideal has been crushed, all herded together. One almost tastes the stench of unclean bodies, and the sulphur odor from fumigated clothes. For quite a while this lack of privacy nearly drove me nuts.

First of all, the physical facilities--warehouses, old factory buildings, schools commandeered for the purpose--were not exactly calculated to lift the spirits.

For instance, a "recreation" room with few amenities was typically overcrowded with men dozing on uncomfortable seats, standing silently or sitting on the floor because there were not enough chairs or benches, a few perhaps playing checkers or dominoes quietly in a corner.

Much worse, though, was the "bull pen," a dark, damp, dismal place located in the basement, where men could go to escape supervision. Often littered with cigarette butts, wads of chewing tobacco, crusts of bread, and discarded clothing, it had no furniture except some backless benches on which "clients"--or "inmates," as they were called--might sleep or have a drink.

The sleeping rooms were sometimes so densely packed with cots that it was necessary for the occupant to crawl in from the head or the foot of the bed, which violated state health regulations. Having been sent to bed at 8:00 or 9:00, the inmate spent the night trying to get to sleep while surrounded by 25 or even a hundred other men, until awoken at 5:30 or 6:00 a.m. The cacophony of "snoring, sneezing, moaning, sleep-talking, and coughing," to quote one account, would likely keep him awake for hours.

For most men there were no pillows or sheets. As for the blankets, they seemed to one reporter to be made of paper, which left the men shivering all night from drafts--drafts that did nothing to ameliorate the stench of perspiring bodies and disinfectants. Bedbugs and lice, fond of this environment, bit and crept all over their prey.

Meal service, too, was inadequate, especially in the years before 1935 when only two meals were served a day, at 6:30 a.m. and 5:30 p.m. (It was assumed that if the men got hungry in the interim, they could go out and beg for food or find odd jobs that might pay a few cents.)

The food itself was not infrequently rotten or bug-ridden, and most of the time was quite bland--cold beets, weak coffee, unbuttered bread, a tin bowl of beef stew, an old piece of fruit, etc.

In general, the central fact of shelter life in the 1930s was *regimentation*. One author summed it up well: "When the man enters the shelter he learns the meaning of the word 'line.' He is a 'linesman'; he lines up to see the caseworker; he lines up for his meals; he lines up to fumigate [every two weeks] and then to bathe; he lines up to wash, to shave, to use the toilet, and to go to bed. 'I spend,' said one man, 'half my waking hours either standing and waiting for something or sitting and waiting for someone.'" "Why in hell don't they line us up against the wall and shoot us and get it over with," grumbled one inmate.

Lines six blocks long to get food, serpentine lines that might take two hours to walk through.

"Watchmen" were always present to intimidate and challenge the men, especially if they were drunk, in which case they might be beaten--with clubs, sawed-off baseball bats, or lead pipes--and forced outside even in the cold night air.

A reporter summed up the whole wretched environment: "The place has approximately the same effect as a jail. It is the individual against the world. The monotony of the same old faces, ideas, arguments, line, nothing to do but sit, finally gets under the skin."

Through collective struggle and activism by the shelter men and social workers who represented them, conditions did improve a little, for example when lunch began to be served in late 1934. Likewise, after a winter of discontent in late 1931--protest demonstrations and individual acts of resistance occurring in shelters all over the city--a Special Activities Department was established to give the men more options for recreation.

In fact, Communist organizers had considerable success in some shelters as they advocated not only for better food and more humane treatment but, more broadly, interracial unity and a nationwide socialist movement.

Daily Communist-run meetings were held in a few shelters, in which the men discussed how best to improve conditions and which specific grievances should next be brought to the shelter supervisor. At the conclusion of these meetings, a researcher remarked, "the radical songs are sung--'Solidarity,' 'We'll Hang Hoover to a Sour Apple Tree,' and the 'Marseillaise.' Misguided as it perhaps all is," he continued, "it is rather a stirring sight to see men and boys stand erect at the end of the meetings and sing these songs with great emotional feeling."

However, despite all the efforts of activists and thousands of shelter men, it proved impossible to significantly improve conditions in Chicago's shelters. Pleading the necessity of "austerity" (to use contemporary language), political and economic authorities refused to divert substantially more resources to them.

And even when most of the shelters were shut down in 1935 and the men transferred to private quarters in rooming houses and tenements, the city's relief administration continued to be so poorly funded that it frequently could not pay the men's rent or provide them with adequate food or supplies. The second half of the 1930s saw crisis after crisis in the financing of relief, leaving thousands of people in dire want and misery.

The struggles of the unemployed to influence relief policy continued, but in the end it took World War II to finally solve their problems and raise their living standard.

Insofar as homeless shelters today are, in most cases, not as inhumane as those in the 1930s, we have decades of popular movements, popular pressure, and public-spirited advocacy to thank. Because of this, in fact, it is unlikely that most shelters will ever be allowed to sink to quite the level they were at in the Depression.

Instead, what will happen is that the loss of government funding will force more of them to close. Meanwhile, more people will require access to shelters because of long-term unemployment. The "shared sacrifices" and "tough decisions" that policymakers insist we must all accept because of government budget deficits will, as ever, disproportionately affect the poor, even as corporate profits remain at [historic highs](#).

Whether we can distribute the economic sacrifices more equitably and so prevent history from repeating itself depends, ultimately, on whether we can build popular movements even greater than those that came to fruition during the Great Depression. At no time in our history has the task of "raising consciousness" been more urgent.

I've been doing better the last few weeks—quite well, actually—probably in part because of taking the Paxil more regularly. But, sometimes, damn the nights. Sometimes can't escape the loneliness, and "cry like a bitch."

I sometimes have the feeling that, as a man, going on a date is like a reverse job interview: the woman is interviewing candidates to be her boss. That's the emotional dynamic, at least.¹ If the conversational tone that the guy sets (for, in my experience, it's almost always the guy who has to, and is supposed to, guide the conversation) is sufficiently jocular, friendly, suffused with sexual tension, and animated by his confidence, then maybe she'll approve of him and, ultimately, let him be her sort-of boss (though not explicitly). It's his job to make her *want* him to be a kind of semi-boss, in sex and in other contexts. Women like a man who leads.

As you know, I'm constantly struck by the obviousness of sexual inequality, and by the blindness that must be required not to see it. Such a degree of unreflectiveness scarcely seems possible to me. Even my highly intelligent Spanish roommate, Oriol (who unfortunately is moving out today to live with his girlfriend), seems oblivious to the *necessity* of sexual "inequality." We've gotten into two or three spirited arguments over it. He's incapable of seeing, or admitting, that something like contemporary gender norms—at least the relative positions of men and women—can practically be read off of biological facts, such as the facts I mention in two of my books.² When sometimes he seems close to admitting it, he simply asks, "What does it matter? Why care about this? It's not important." So I just tell him that I value intellectual clarity and sexual understanding, and it disturbs me that so many people are able to deny obvious truths and live in self-blindness. (It also irritates me that feminists can claim the moral high ground precisely by being idiots.)

Another source of my fascination/irritation is that I am, in fact, more committed to equality between the sexes than most women and feminists are. I value it more, and act on that value more consistently. For on dates and in social life generally, I'm perfectly happy to treat women as true equals, not necessarily trying to "charm" them or treat them like children (as most men do, implicitly) but rather like adults, being less sexist in my behavior than nearly everyone. The whole need to perform and charm and exude overt "bigger-than-you"-ness is something I'm not great at, being too egalitarian and laid-back.

When I try to imagine, or intuit, what most people's consciousness must be like, I can only come up with the idea that it's a primitive sort of unreflective glibness, a non-openness to intellectual impressions, a brute particularity that can't step back from itself or detach itself from considerations of *value* (like and dislike). This is the only "modality" of consciousness that would seem to account for most behavior. I imaginatively try to *inhabit* that consciousness.

Sometimes I think of Schopenhauer's distinction between the ordinary person and the so-called "genius." He was on to something in his descriptions of the differences.

¹ The desire for a (semi-) "boss" explains, for instance, the female love of men in uniform. Uniforms express authority. "A woman's happiness is to serve," figuratively speaking. ("Serving" her husband, her children, her friends, or whatever.) This doesn't mean that women are "inferior" to men—whatever that's supposed to mean—but it is, indeed, a fact. It's less true, of course, of the masculine women, including many feminists.

² But you don't even need "biological facts." All you need is to think of women having sex, with their moaning "Ohhh, ohh, uhhh, yeah, I love your power! Spank me, pull my hair!" From *that*, almost everything can be deduced. But intellectuals specialize not in *uncovering* but in *covering up* truth.

Got an email through my website that I saw tonight just in the right moment to rescue me from a mood of intellectual paralysis due to loneliness and longing:

Hi Mr. Wright. I sincerely hope this finds you well. I came across your writings and books almost a year ago, and I have learned a lot reading your work! You are a great writer and easy to learn from with your conversational, unpretentious style. Anyways, I really hope I do not annoy with this email, but I was hoping to maybe glean your advice on which direction to go in my education. I am interested in studying history, philosophy, and the human condition. I am also interested in furthering humanity in its rational progression toward the dismantling of institutional structures of coercive power through knowledge and teaching in these various subjects (coupled with actual activism). My question is basically, what path do you recommend in getting an education in any of these subjects with these aims in mind? I have a bachelor's degree in Finance & Investments that I regret getting very much and may essentially be worthless in such pursuits, but I wanted to know if there were avenues of higher study that you would be able to recommend to someone who feels a bit lost. Are there any specific programs and/or any specific professors teaching today that you could possibly recommend looking into? What do you think is the prospect and even the advisability of trying to enter graduate-level or doctoral-level programs in any of these areas with a largely irrelevant undergraduate degree like mine? Any information, general or specific direction, or words of advice you could provide would be infinitely appreciated. I currently live in New York and am 28 years old, just for reference. And if you haven't the time to respond, as I'm sure you are inundated with your own work and life, then don't feel obligated in the least! Just thought an attempt at some insight wouldn't hurt. Many thanks for taking the time to read (and write, incidentally).

*

Reading *The Interpreted World: An Introduction to Phenomenological Psychology* (2005), by Ernesto Spinelli.

Went to an absolutely absurd, self-indulgent, incomprehensible talk today by the famous postmodernist Ann Laura Stoler. Most of the audience seemed to share my amused befuddlement. Rehashings of Foucault, attempts to invent new concepts like “duress” with which to analyze colonial and postcolonial situations (and promiscuous use of a melange of old postmodern concepts like “genealogy” and “occlusion” and whatever else), altogether more an exercise in literary wordplay than anything else. But it reminded me of how this sort of postmodernism is essentially a *historical phenomenology*, or at least an attempt at such. Trying to uncover meanings somehow implicit in social experience, latent dimensions of experience—but of course in the service of questioning all our ordinary assumptions about the world, etc. And all done in a hyper-abstract way, throwing concepts around like continuity and rupture, and assonant or alliterative words like endurance, durability, duress, duration, to make the attempt at phenomenology flowery and poetic. The whole performance was a cautionary tale in how phenomenology, especially when done in a “theoretical” way, must always be the object of healthy skepticism. Its subjectivism should already make one suspicious of it. I still think it can, when done well (e.g., in Sartre’s *Anti-Semite and Jew*), be illuminating...but I have to admit, even then I tend to be suspicious of its “cash-value.” (See William James.) I’ve done it a lot myself, but it’s hard to know how to characterize the understanding that’s produced, since it isn’t testable or scientific. As an exercise in imagination (intuition) rather than rigorous *argumentation*, phenomenology seems closer to literature than science. And it’s often metaphorical. It can be fun, though, and it can have much more *human significance* (so to speak) than, say, cognitive science.

Another unfortunate thing is that phenomenological descriptions like Laing’s above [which I’ve deleted] exist on two levels, as it were. From an “external” perspective they can seem like mere words,

words, words, evocative but “easy,” only literary and abstract. From an “internal” perspective, on the other hand, as *intuited* or *experienced* either directly or through an act of sympathetic imagination, they become deeper and more compelling, “concrete,” such that a type of understanding (maybe you could call it “experiential understanding”) seems to have been reached.

Anyway, here’s a quotation from Spinelli’s book: “On the one hand, we [as individuals] strive for a sense of our own uniqueness, wanting to be singled out for recognition, status, and love. On the other hand, however, our sense of distinctiveness may also give rise to feelings of isolation and loneliness. Thus, our self-awareness reveals opposing aspects that are often a major source of conflict as to our interrelations with others and the world in general.” True. It’s interesting, the desire to be special but at the same time the desire to fit in. How do you explain the presence of these two conflicting desires in the same mind, probably in every mind? Evidently they’re just two different manifestations of the central desire that one’s self-love be validated. You want others to recognize you as *superior* in some sense, but you also want them to see you as *equal*, such that you can “bond” with them (and have your self-worth be confirmed in that way too). Or maybe a better way to say it is that your desire for the *respect* of others is best fulfilled if they set you apart and above them, whereas your desire for their *affection* is best fulfilled if they treat you as part of their “community” and hence an equal. —Two different modalities of self-confirmation.

—Again, such phenomenologically inspired thoughts may be interesting sometimes, but the self can be interpreted in so many ways that it seems... what’s the point? What’s the point of soft psychological investigations like this, or like much of social psychology and so on? It’s just a bunch of interpretations, a bunch of more or less different perspectives, with no apparent scientific payoff. Where does it get you?

As I read this book, I’m reminded that intellectually and “emotionally,” so to speak, I’ve moved beyond all this psychologizing. Whether it’s existential psychology, social psychology, humanistic psychology, cognitive-behavioral psychology, or (especially) psychoanalysis, it seems like one big quagmire. Endless reams of often interesting interpretations that in their aggregate amount to an Everest of verbiage. I simply don’t trust intellectual endeavors that seem so navel-gazing, obsessively self-interpreting, even if I do on occasion still enjoy dipping my toe into the quagmire—but then quickly withdrawing it, lest I get sucked in. In part, it’s an *aesthetic* preference of mine. I prefer the aesthetics of masculinity to that of femininity. Objectivity over subjectivity. Science over constant consciousness-probing. And yet sometimes the results of consciousness-probing do seem rather compelling and true, and the science... well, the science, for instance the cognitive science, somehow just seems like *collecting information*. I guess the problem is that it offers me fewer possibilities for creative engagement than the humanities and social sciences do. But given my dissatisfaction with the latter, I end up with no intellectual passions at all.

By the way, it’s certainly true that various approaches to psychotherapy do sometimes work, or at least have positive consequences. But no one really understands *what it is* about the therapy that has worked. Why it works for someone and not for someone else. Etc. If the mind is an ocean, psychologists are a few scattered marine biologists dipping below its surface in tiny submarines.

So let’s just embrace history for now, intensively. I ought to have been reading more of it than I have in the last couple years. Have to catch up! *Internationalism in the Labour Movement, 1830–1940* (1988), edited by Fritz van Holthoon and Marcel van der Linden. Two volumes, but of course I’m only reading some of the essays that are in English.

—Wait, before leaving psychology, one more remark. Spinelli is right that a valuable contribution of phenomenology is to reinforce the lesson of all sophisticated psychology and biology that in experiencing the world, you’re mainly experiencing your own mind. Ordinary experience teaches us much more about the structures in/of our minds—and, with regard to our interpretations of people, our own individual predispositions, biases, unconscious memories, personalities—than about an external world or other people “in themselves.” This lesson is most obvious as regards our physical perceptions, which are constructed by the nervous system according to innate (and perhaps, to some extent, acquired) schemata. But it also applies to our judgments and impressions of others, which, in particular moments, largely depend on our mood, our expectations, the impressions we’ve already formed from previous encounters with the person, whether he or she reminds us of other people we’ve known, etc. There may be some validity to our judgments—for

example, insofar as others would agree with us—but, as I’ve said many times before, they rarely or never have the kind of validity we think they do. They reflect *us* as much as they reflect the other.

...Okay, back to history. Intellectual and cultural historians should always remember my dictum that the *lower* classes tend to be more ideologically and culturally creative than the upper classes. Usually it is among the lower or lower-middle classes that ideas (and forms of art) originate; they are then taken up and refined or even ennobled (sometimes) by progressive, creative members of the upper classes (or lower-born geniuses who secure the approval of the upper class, e.g. Beethoven). Think of how the Levellers during the English Civil War originated what later became political liberalism and modern democratic ideologies.¹ Locke wasn’t really original, and the framers of the American Bill of Rights were doubly or triply unoriginal. (It’s ironic that it was in a context created by the English state—namely, the New Model Army—that anti-statist and democratic ideas first caught fire.)

Reading Elizabeth Tandy Shermer’s *Sunbelt Capitalism: Phoenix and the Transformation of American Politics* (2013). Excellent book, and very ambitious. Useful as, among other things, a reminder that the main reason the South and Southwest finally overcame their colonial status as little more than providers of raw materials to Northern industry was massive intervention by the federal government during the New Deal and World War II, and afterwards. Massive infusion of funds, building of infrastructure, planning of development—which was aided and continued by states, municipalities, and businessmen’s associations. The “developmentalism” would have been even more successful had local and some national businessmen not opposed liberal policies of high wages, income redistribution, social welfare programs, racial equality, etc., or had they permitted the TVA to be replicated elsewhere.

The book is also a reminder that “neoliberalism” isn’t new. For the Global South, of course, it’s very old. But even for huge swathes of the U.S...well, as you know, the country as a whole was basically neoliberal before the New Deal, and conservatives and most business communities never renounced their commitment to neoliberalism (so-called free markets, anti-unionism, low taxes on business, corporate welfare but no social welfare), and in the postwar era the South and Southwest were semi-neoliberal. Neoliberalism is just...capitalism not tamed by organized labor (and the regulatory, social-welfare regime it buttresses). The “New Deal state” was extremely precarious and limited, under constant attack.

The more you read about politics and society, the more deeply you understand that, to a good first approximation, government exists but to make the world safe, lucrative, and pleasurable for the rich. That’s its purpose. To the extent that it harms the rich or does not heed their interests, it is literally failing in its chief function. The task of popular movements is to change the calculus so that it is in the interest of the rich to help the poor (because if they don’t, the poor will cause mayhem, or at least influence government in such a way that it harms the rich).

The nationwide “tax revolt” of the 1960s and 1970s is an interesting thing to study. It’s usually thought of as having been basically conservative, a movement of white suburbanites against the high taxes imposed by liberal administrations. In fact it was at least as progressive as it was conservative, as much a reaction against business rule as against “tax-and-spend” liberals. In the postwar era of intense competition between states and municipalities to attract business investment, big business had secured incredible tax concessions and corporate-welfare public subsidies, which increased the tax burden on small property owners in both the suburbs and inner cities. So suburbanites and the working class to some extent shared an interest in reforming and democratizing local and state government. Many whites actually used the language of big-business-boosters to criticize business rule: it was contrary to individual rights, free enterprise, and democratic capitalism, it instituted high taxes, it was too in bed with the federal government, it amounted to creeping socialism, etc. (This conservative white “populism” also used the language of God and Christianity more than establishment conservatives did or were comfortable with.) At the same time, civil rights groups, black power groups, the Chicano movement, and other progressive forces were reacting in their own ways against business rule, sometimes overlapping with but frequently opposing the white

¹ Actually, it was surely not the Levellers who *originated* these things; earlier groups, such as radical peasants and artisans, were democrats and “liberals” as well. (We want a limited state, but a state that protects us from the predators! Etc.) The ideas must have already been in the air for many years. But the Levellers brought them to prominence.

populist mobilization. So politics at state and local levels, not to mention the national level, was very complicated and confusing/confused. But because of its ideological confusions, white populism and the tax revolt could be harnessed to business's old crusade against the liberal state, so that the potentially semi-progressive ire became ever more Reaganite-fascist by and during the 1980s. (That sentence is me, not Shermer, but it's surely true.) And yet the two main strains in conservatism, the populist-fascist and the establishment-conservative, never fused, making possible what we're seeing now: another rebellion by angry white populists against business rule (which is semi-confused, again, with "liberalism"), this time a more scary-to-the-establishment rebellion than that of the 1960s and '70s. For it has foisted Donald Trump onto the Republican party! The chickens are coming home to roost. Finally.

Read Marcella Bencivenni's *Italian Immigrant Radical Culture: The Idealism of the Sovversivi in the United States, 1890–1940* (2011). A friend recommended it. (The unjustly forgotten Arturo Giovannitti!) Now Walter LaFeber's classic *The New Empire: An Interpretation of American Expansion, 1860–1898* (1963). Oh idiot me, so many great books I ought to have read by now! How I've wasted my time!

Useful comments on the late-nineteenth-century depressions: "As efficient machines produced more and more industrial and agricultural goods, consumption could not maintain the pace. The resulting deflation needed only the impetus derived from a few failures of large banks or Wall Street firms to push the economy into a full-scale depression. In the twenty-five years after 1873, half were years of depression: 1873–1878, 1882–1885, and 1893–1897. As each panic struck, Americans became convinced that the new one was worse than the last. Although they believed the 1893–1897 crisis to be most destructive, and although it did have the greatest impact on the formulation of foreign policy, economists have demonstrated that the depression of the 1870's was actually the worst... The break in the early eighties was especially sharp. Agricultural prices fell when good European crops combined with still greater American wheat production in 1881 and 1882. Industrial prices followed suit. Between 1880 and 1884 business failures tripled in number to almost 12,000 annually. The economy would not stand upright again until after 1897..."

"In some respects, however, the mushrooming industrial economy fed upon these depressions. In discussing the 1873 panic Andrew Carnegie later acknowledged: 'So many of my friends needed money that they begged me to repay them. I did so and bought out five or six of them. That was what gave me my leading interest in this steel business.' [Thus, as Marxists theorize, strong capital survives, weak capital is weeded out. Concentration and centralization of capital is the result.] ...Out of [the] expanded and productive plant [at Homestead] would come vast amounts of steel, much of which sought foreign markets in the 1890's because of insufficient demand at home. It was truly twenty years of boom hidden in twenty years of crisis."

At the same time, more and more American money (from huge profits) flowed into Europe, Latin America, Canada, and Asia. As the United States began exporting more than importing, it made up the difference by buying back American securities abroad, buying foreign stocks and bonds, and building American-owned transportation systems and industries abroad.

"The importance of this industrial power was just becoming apparent by the time of the Civil War, but agricultural surpluses had played a key role in the nation's foreign relations ever since Maryland and Virginia planters had tried to find markets outside the British Empire for the rich tobacco harvests in the seventeenth century. By 1870 the American economy depended so much upon foreign markets for the agricultural surplus that the economy's ups and downs for the next thirty years can be traced in large measure to the success or failure of marketing each year's wheat and cotton crops. No matter how many markets could be found, more always seemed to be needed. With the opening of vast new lands after 1865 and under the impact of farm mechanization, the production of wheat and cotton soared beyond all previous figures... Between 1869 and 1900 the home market bought between 75 per cent and 85 per cent of the total value of farm products, but the most important items of cotton, tobacco, and wheat depended much more on foreign markets... If foreign markets meant good instead of mediocre or poor profits for some industrialists, adequate markets abroad meant the difference between being solvent or bankrupt to many farmers."

For a while the great frontier of the American West provided new markets and sources of raw materials. But when in the 1880s many Americans feared that the frontier was closing, “they reacted in the classic manner of searching farther west for new frontiers, though primarily of a commercial, not landed, nature. This swept them into the Pacific and Asiatic area and hence into one of the maelstroms of world power politics.” Another main thesis of the book is that as the internal frontier began to stagnate, an intensified threat to social order emerged in the form of “bankrupt farmers, unemployed laborers and miners, and bitter social critics including some of the foremost novelists of the day. Foreign policy formulators and many businessmen viewed expanding diplomatic [or imperialistic] interests as one way to ameliorate the causes of this discontent.”

Already in the first chapter LaFeber gives a ton of evidence demonstrating industry’s tremendous interest in foreign markets, and its increasing interest in enlisting the government in the service of this agenda. By the 1880s industry was also growing more favorable to the idea of free trade—low tariffs or no tariffs for the sake of cheaper raw materials, which, along with increasing mechanization, would soon enable American industrialists to undersell England anywhere in the world. For England still had overwhelming dominance of world trade, and industrialists wanted to end this.

“In the unfolding drama of the new empire William Henry Seward [Lincoln’s Secretary of State] appears as the prince of players. Grant, Hamilton Fish, William M. Everts, James G. Blaine, Frederick T. Fellinghuysen, and Thomas F. Bayard assume secondary roles. Although Seward left the stage in the first act of the drama, only a few of the other players could improve on his techniques, and none could approach his vision of American empire.” In fact, his vision of empire (which was influenced by John Quincy Adams) dominated American policy for the next century—or longer. Imperial manifest destiny, world empires inexorably moving westward, Asia and the Pacific as America’s destiny, etc. With Obama’s “Pacific pivot,” we can see that Seward was indeed far-seeing. His ambitiousness was breathtaking. Envisioned eventual annexation of Canada, Mexico, and Central America, bought Alaska in part as “a foothold for commercial and naval operations accessible from the Pacific States” (to quote Seward’s son), wanted to hold islands in the Caribbean to protect an isthmian route to the Pacific and also prevent European powers from interfering with the Americas, prepared the way for the American embrace of Hawaii and the Midway islands, negotiated a treaty with China in 1868 that gave Chinese laborers almost unrestricted entry into the country so they could supply cheap labor to build railroads and the like, advocated high tariffs to protect small industries and attract foreign laborers (and also to give the federal government money for internal improvements, such as Quincy Adams had favored), etc. Seward is sort of the patron saint of modern American imperialism.

Grant and his Secretary of State Hamilton Fish continued the expansionist drive, into both the Pacific and especially Latin America. With regard to the latter, the U.S. “launched a four-pronged attack bearing all the characteristics of the new empire: attempted control of certain Caribbean islands, important for their strategic locations and raw materials; investment, notably in the new southwestern frontier of Mexico and Central America, by American capitalists; trade expansion...; and American control of an Isthmian canal. By 1904 the attack launched during the previous half century had won the field.”

Secretary of State Everts was important in his promotion of commercial empire and the expansion of trade. His 1880s successors Blaine and Frelinghuysen devoted much of their attention to finding Latin American markets for American goods, partly in the belief that the prosperity that could be secured by expanded foreign markets would mitigate internal social conflicts. For instance, Frelinghuysen negotiated bilateral reciprocity treaties with various Latin American countries to obtain lower tariffs on U.S. manufactures in return for lower tariffs on raw materials that the U.S. imported. He hoped thereby to draw these countries more closely into the U.S. sphere of influence and away from Europe. Wanted the benefits of annexation without the political burdens. Bayard, Cleveland’s Secretary of State, “switched State Department attention from Latin America to the Pacific,” such as Samoa and Korea.

The modern American navy began to take shape in the 1880s—which, incidentally, put an important vested interest behind the “New Navy,” for it was decreed that all armor, steel, and ordnance for American ships had to be made in America. The construction of a great battleship fleet after 1890 “revealingly typifies the more ambitious qualities of American expansion in that decade” than in the

previous one. In fact, LaFeber concludes that “the years between 1850 and 1889 were a period of preparation for the 1890’s.”

Having considered the period of preparation, LaFeber turns first to the intellectual rationales for expansionism in the 1890s. One of them is associated with the name of Frederick Jackson Turner, though it was a common ideological current of the time. “An important part of the rationale for an expansive foreign policy in the 1890’s was a fervent (though erroneous) belief held by many Americans that their unique and beneficent internal frontier no longer existed.” The closing of the landed frontier supposedly necessitated the opening of a new commercial frontier. Other rationales were provided by influential vulgar ideologists like Josiah Strong and Brooks Adams, while Alfred Thayer Mahan, who was of more direct significance to policymakers, strategized about the importance of a navy and occupying strategic bases (though *not* actual colonies). Of course Social Darwinism and Anglo-Saxonism were of enormous importance as well.

On the beginnings of the modern battleship navy: “Commercial war could easily flash into a military conflict. This was the lesson Alfred Thayer Mahan taught in his influential writings published after 1890. Between 1889 and 1892 other new empire expansionists arrived at the same conclusion in a series of significant congressional debates. The result was the creation of the United States battleship fleet.” Also submarines, heavy rapid-fire guns, smokeless powder, torpedoes, and heavy armor. The country’s expanding foreign trade had to be protected, if necessary by raising blockades, attacking an enemy’s coast, or even striking the first blow in a conflict. As Benjamin Harrison’s Secretary of the Navy said in 1891, “the sea will be the future seat of empire. And we shall rule it as certainly as the sun doth rise.” (Germans, of course, were starting to think along the same lines, building up their navy.)

Despite the general desire not to assume literal political control over territories, Harrison tried to annex Hawaii in early 1893. Americans already had a military base at Pearl Harbor (and another base in Samoa), but Harrison worried about the unpredictability of Hawaiian politics and the possibility that some other foreign power might become ascendant. He wanted Hawaii partly for its riches of sugar and rice, but especially because of “the islands’ value as a naval base to protect the [planned] Isthmian route and as a coaling station on the avenues to Asia.” To quote an administration spokesman (in all but name),

...The necessity for new markets is now upon us, and with it the necessity for cultivating close commercial and political relations with the rapidly growing nations of South America and Australia and with the newly awakened empires of China and Japan. As a prime condition of this extending influence, the duty of controlling the Isthmian routes is clear to every intelligent mind... To render that control sufficient, the [American] sovereignty of Caribbean territory and of Hawaii is absolutely necessary.

In the end, Congress didn’t want the problems of governing a multiracial Hawaiian population, particularly in the context of a depression, so annexation (as a territory, not yet a state) had to wait until 1898. The Harrison administration also tried to obtain strategic bases in Haiti and Santo Domingo but failed.

The most important prerequisite to achieving the empire that Harrison desired was “the formation of a consensus by important political and business leaders on the necessity of a more expansive foreign policy.” This consensus resulted from the depression of 1893 to 1897. Economic analyses by the Cleveland administration, the business community, and leading congressional figures “led these three groups to conclude that foreign markets were necessary for the prosperity and tranquillity of the United States. These groups also drew the corollary that British commercial competition, especially in Latin America, endangered America’s economic well-being.” LaFeber continues:

In their attempts to discover an antidote for the depression, the Cleveland administration and the business community could usefully draw on the facts of recent economic history. Crop failures and the collapse of the Baring Brothers banking house in England had sent western Europe spinning into a severe recession in 1890. Americans, however, had escape the crisis by exporting an abnormally large amount of their agricultural products... Again in 1892 European crops failed. American farm exports, finding excellent continental

markets, once more reversed the gold flow [out of the U.S.]. Observers in business periodicals and in the Harrison administration...warned that only these exports shielded the United States from economic embarrassment.

A long and confusing discussion follows of the gold vs. silver currency controversy, tariffs, and the depression, but I'll skip that. Easier to understand is that business was investing ever more in Latin America, and industrialists were trying ever more vigorously to develop Latin American markets. The National Association of Manufacturers was founded in 1895 primarily with the goal in mind of expanding foreign markets; its constitution and opening convention looked to the government to improve market conditions and trade, through reciprocity agreements, a "judicious system of subsidies" to build a merchant fleet, a Nicaraguan canal, and the rebuilding of internal waterways. (Yes, what a shock, the organization that later was obsessively pro-"free market" when it came to governmental amelioration of labor conditions was absolutely anti-free market when it came to measures that would help business.) Foreign markets were all the more necessary at this time because the depression had shrunk the domestic market.

In early 1894, under pressure from business, the U.S. sent warships to Brazil to interfere with a rebellion occurring there. The result was that the rebels lost, and American trade benefited. Soon afterwards, the Cleveland administration intervened in Nicaraguan affairs and was able to maneuver England out of its strategic location in Nicaragua. In doing so, Cleveland's Secretary of State committed the U.S. to interfere in the country whenever American commercial or strategic interests were threatened. (American business had established banana plantations on an Indian reservation there, which now became a *de facto* American protectorate.)

In 1895–96 occurred the Venezuelan boundary crisis. "In the development of the new empire, only the economic effects of the 1893–1897 depression and the battle of Manila Bay in 1898 rank in importance with the Venezuela boundary crisis." This crisis had to do with a valuable stretch of Venezuelan territory next to British Guiana that both Venezuela and Britain laid claim to. The U.S., which even in its public opinion was growing increasingly angry at Britain's continual semi-violations of the Monroe Doctrine, was adamantly against the British claim. So Cleveland and his Secretary of State sent a couple of strongly worded letters to the British prime minister saying, in effect, "you can't have the territory because of the Monroe Doctrine!" Cleveland was even willing to risk war over the affair, and intimated so. In the end, a compromise was worked out according to which Britain got some of the disputed territory but not the most valuable parts. More importantly perhaps, Britain recognized America's dominance in the Western Hemisphere. Venezuela, incidentally, was consulted by neither the U.S. nor Britain in this whole affair.

As you know, it was during McKinley's administration that everything exploded. In 1897, German seizure of a key port in China menaced American trade and threatened the whole open-door policy that both Britain and the U.S. were determined to maintain. McKinley therefore began fortifying American naval power in the Pacific. His administration also paid close attention to the Philippine insurrection against Spanish rule that began in 1896, and decided that should war break out between Spain and the U.S. in Cuba it would attack the Philippines too. In 1897 McKinley submitted a treaty to annex Hawaii, which Congress approved in mid-1898. Influential sections of the business community, of course, supported annexation. "During the eighteen months before the United States went to war with Spain, American businessmen began their most intensive search for foreign markets." Trade journals were full of the drive for new markets, and celebrated the fact that American industry was continually pushing British industry out of some new area of the world. "When industrial employment began to rise in late 1897," LaFeber says, "observers quickly gave the enlarged foreign markets much of the credit."

The climax of all this semi-imperialism was the Spanish-American War. The Cuban revolution that had begun in 1895 was of grave concern to both Cleveland and McKinley because of the damage it was inflicting on American property, business, and interests, particularly the interest in economic prosperity. Neither administration was keen to get involved in the war or to annex Cuba, but by 1897 McKinley was demanding constructive action by Spain to end the war—or else. He pressured the Spanish government to enact reforms on the island that might mollify the rebels, and to some degree it did enact such reforms, but they didn't end the fighting. In early 1898 the *Maine* blew up and sank, but for a couple months McKinley

still resisted popular calls to go to war. By March, though, important sections of the business community wanted war (for various reasons—they thought it would mean full prosperity, it would head off a more radical social revolution, American annexation was the only way to have a stable government, it would end debilitating business uncertainty, etc.) and there were indications that the Republican party would do very badly in the 1898 elections if McKinley didn't go to war. Congress was also in a belligerent mood. So finally in April McKinley issued an ultimatum to Spain, which it didn't accept. As a result, war broke out.

The territories that the U.S. seized after the war were obtained “not to fulfill a colonial policy, but to use these holdings as a means to acquire markets for the glut of goods pouring out of highly mechanized factories and farms.” For instance, Mark Hanna wanted “a strong foothold in the Philippine Islands [in order to] take a large slice of the commerce of Asia.” Strategic bases were necessary in order to protect the nation's commerce.

Now reading the parts of *Poor People's Movements* that, for some reason, I haven't read yet. “Why did the Democratic party embrace the civil rights agenda in the late 1950s and 1960s, after so many decades of opposing it?” you ask. Good question. “Was it out of altruism or some sort of moral epiphany?” Stupid question. No. It was because of electoral conflicts and weakening party allegiances that resulted from the disruptive tactics of the civil rights movement. Southern whites were increasingly switching to the Republican party in the 1950s, in part because business and the rising white middle class were not very friendly to the party of the New Deal, and also because Democrats' large black constituency prevented the party from making bold statements against civil rights. But in the election of 1956 many blacks also defected from the Democratic party because of its tepid support for civil rights. So something had to be done. “Perhaps the party could afford southern defections, or black defections, but it could not afford both.” Hoping to entice more blacks away from the Democrats, congressional Republicans submitted a civil rights bill in 1957 (breaking ranks with southern Democrats), which northern Democrats and Lyndon Johnson, Senate Majority Leader, supported. Thus was enacted the first civil rights bill since 1875, though it was largely symbolic. A second one, sponsored by the racist Eisenhower, was enacted in 1960, as Republicans continued to hope for black defections from Democrats.

As you know, Kennedy was quite passive on the civil rights issue as he tried to steer a path between liberal activists and racists. Some token advances, but little spontaneous enforcement of the law or encouragement to activists. The Freedom Rides forced the government to order the desegregation of all terminal facilities for both interstate and intrastate passengers, but the Kennedys encouraged activists to focus on voter registration rather than the highly polarizing issue of desegregation—in part because they realized that blacks in the South “represented a huge untapped pool of potential Democratic voters.” But voter registration, too, elicited massive white violence and didn't have much success, so the administration effectively abandoned the activists it had said it would support. Still they pressed on, often with disruptive tactics, and eventually with mass marches that provoked widely publicized white violence. As the civil rights movement contributed to the rising tide of anger in northern ghettos, and as northern whites increasingly supported the granting of political rights to southern blacks, “the balance of electoral considerations shifted decisively” in favor of protecting civil rights in the South. Local political leaders in the South, for their part, started to favor more moderate policies in order to attract northern business, which was repelled by racial turmoil and social instability. And so, etc. You know where the story is headed. Violence, marches, the deterioration of social order forced Congress to pass the civil rights acts of 1964 and 1965.

Somewhat less plausible is the authors' explanation of why the black movement ceased to be effective: it grew too “organized,” so to speak. Activists and others were channeled into traditional electoral politics and other mainstream institutions. “Many other institutions [besides government] also began to admit blacks: business and industry responded to mass unrest by hiring blacks; institutions of higher education, themselves rocked by the struggles of the period, revised their admissions policies to admit more minority group members, some of whom had been in the front ranks of the civil rights struggle. Having gained entry to these institutions, blacks frequently formed ‘caucuses’ or developed other intra-institutional subgroups in order to exert ‘black power.’ In short, the society overtook the movement, depleting its strength by incorporating its cadres and by organizing blacks for bureaucratic and electoral politics.” That

seems too pat. The co-optation and institutional diffusion of leaders and masses may have been part of the problem, but other factors were clearly at play too. (Such as violent repression.) Monocausal explanations of this sort of thing are insufficient.

But the book's main thesis is probably right: mass-based organizations of the poor to pressure political leaders tend to be less effective than mass mobilization for disruptive protests with the goal of creating a political or social "crisis." It was *disruption* that achieved the victories of the civil rights movement, the CIO, and the Depression's unemployed protests. Ella Baker criticized SCLC's philosophy of mobilizing thousands of people for big actions because it didn't cultivate local leadership or leave behind local organizations, but, well, it worked! It caused major disruptions in the South that necessitated federal action. If *confronting* power is better than *working with* (or lobbying) power, then surely widespread and large-scale confrontations are better than localized and small confrontations, such as Baker's philosophy might produce. —On the other hand, if you can create *many* nuclei of local activism, and if these nuclei all focus on disruptive actions that interfere with The Machine's functioning, then they, too, might be very effective.

Anyway, the chapter on the welfare rights movement of the 1960s is quite interesting, particularly in its description of the local welfare rights organizations that sprouted all over the country in the late 1960s. In many respects they were strikingly similar to the Unemployed Councils of the 1930s! For instance in their tactics: sit-ins, demonstrations, collective confrontations with welfare officials (which were notably successful). What an admirably turbulent decade the Sixties was! Thank god we're on the cusp of another such period.

Now Walter LaFeber's *Inevitable Revolutions: The United States in Central America* (1993). He interprets the history as consisting of several stages: *first*, the U.S.'s setting up of its Central American policy or "system" between the 1890s and World War II, a system that involved forcing a dependent status on Central America, limiting it to the production of food and raw materials, intervening militarily when necessary to keep it stable but then, by the 1930s, increasingly relying on dictators and indigenous militaries to do so (which was Roosevelt's "Good Neighbor" policy)¹ because blatant U.S. interventions caused too many problems; *second*, maintenance of the system under Truman and Eisenhower; *third*, updating of the system by means of the Alliance for Progress in the 1960s; *fourth*, collapse of the system in the late '60s and '70s, as the oppressed masses rose up; and I'll get to the later stages when I get to them.

One of the key means of "maintaining" the system, of course, was the innovation under Truman and Eisenhower of providing extensive military aid to Latin American countries—not for global or regional operations, but for "internal security." (Root out and destroy the Commies! And all leftists.) Latin American officers were to be trained at the School of the Americas in the Panama Canal Zone. "The Good Neighbor [policy] became less a policy of economic growth or reform than of military ties and leverage. And as the United States policy became militarized, it most directly appealed to, and necessarily counted on, Latin American dictators to protect North American interests." By the end of 1954, military dictators ruled thirteen of the twenty Latin American countries.

Side thought: one of the ironies of World War II is that most of the military, political, and economic leaders among the Allies were far more Nazi-like than democratic. They thought of themselves as defending democracy, but they were mostly rank authoritarians, racists, anti-Communists, imperialists, antisemites, and reactionaries. I recall that one of them said something like, "We're fighting the wrong enemy. We should be fighting the Communists—if it weren't for Hitler's megalomania." But actually, the leaders of the Soviet Union had almost the same authoritarian, imperialistic, racist, anti-democratic, anti-socialist values as the leaders of the U.S.

¹ Another aspect of the Good Neighbor policy was that the government replaced American bankers as a source of funds. The Export-Import Bank was created in 1934 to provide credit to Central American governments so U.S. exporters could sell more goods overseas. (It gave loans for many infrastructural projects, to which strict political conditions were attached. E.g., U.S. materials had to be used in the projects, and the enterprises created had to fit into and couldn't compete with American businesses.)

Anyway, by the late 1950s the reactionary policies of the Eisenhower administration were contributing to political turmoil and economic decay in Latin America, which greatly worried Americans because a new upsurge of left-wing movements might take power. In 1958, Eisenhower—who for years had refused to give substantive economic aid to Latin America because of, you know, the free market and capitalism and his preference for military aid and killing people—finally agreed to the establishment of the Inter-American Development Bank, to give loans for infrastructure projects. This was a major departure in U.S. policy, which had favored ineffectual private investment. But Eisenhower refused to go farther than this, preferring to stick to his tried-and-true method of military support or intervention, as when he approved CIA plans to train Cubans for an invasion of Castro's domain. It was left to the Kennedy administration to try something bolder: the Alliance for Progress.

LaFeber introduces this program in a grand way: it stimulated high growth rates in a number of countries, including Nicaragua, Guatemala, El Salvador, and Costa Rica, at the same time that it inflamed severe political and social problems in the first three countries. “Ironically, it became the pivotal, perhaps even the essential, step on Central America’s journey to the revolutions of the seventies and eighties.” For the sake of heading off revolution, Kennedy wanted to pump \$100 billion into Latin American development over ten years—\$20 billion from the U.S., \$80 billion from Latin Americans. With the support of indigenous social democratic groups, he hoped to weaken both dictators and the far left by building up stable middle classes. So, for instance, coffee stabilization agreements were worked out to raise prices (which had dropped rapidly) and rescue countries from balance-of-payments crises. “Security” was just as important as “development,” so U.S. military aid increased 50 percent a year over the money granted under Eisenhower. “Military funds inundated small economies, transformed government budgets, and created a large military group trained by U.S. officers” in the School of the Americas and elsewhere. “The transformation of police forces was notable. Under the Agency for International Development, which operated the Alliance program in Washington, these forces learned to use gas guns, helicopters, and other anti-riot equipment. For this newly powerful elite, it proved to be only a short step to controlling dissent through sophisticated methods of torture.” With the help of all this money and training, between 1961 and 1966 militaries overthrew nine Latin American governments. As for development, “Alliance funds in massive amounts went to U.S.-owned firms and to the Central American oligarchs that controlled banks and mercantile businesses, as well as the best tillable land.” As always, the wealthy and politically connected benefited far more than the poor.

Lyndon Johnson was less enamored of the Alliance than Kennedy, so when he became president he reduced economic—though not military—aid. Relied, as had Eisenhower, on private capital and military regimes to accomplish development. So by the late sixties, “the Alliance’s remnants consisted of its most dangerous parts: an emphasis on private investment that worsened the already glaring economic imbalance in Central America; a dependence on the military to maintain order in restless societies; and promises made repeatedly by Kennedy, Johnson, and other U.S. officials that raised hopes and aspirations. The first two were destroying the third. And as revolutionary conditions developed, the United States government stood aside, except for its support of the military.” In many ways the Alliance actually accelerated and laid the basis for the coming revolutions, for example by mechanizing agriculture and forcing peasants into cities where they languished in unemployment. In Honduras (and elsewhere), “the post-1963 changes [in the Alliance’s program] led to a stripping of the nation’s wealth by foreign investors, the Hondurans’ increased loss of control over their own banking and productive system, and major defeats for Honduran liberals... By 1968...the investment boom in commercial agriculture (especially in cattle and cotton) had led to an illegal expansion of large haciendas over peasant-tilled lands. The oligarchs’ agents simply strung barbed wire around the area they wanted, then expelled any families found inside the barbed-wire compound. Peasants who tried to take wood from these areas were jailed on order of the new owner.” Hmm... Remember the centuries of peasants’ struggles in Europe against the privatization of forests? Funny how history is constantly rhyming with itself.

In Honduras, “unemployment rose 25 percent between 1961 and 1967, not counting the 150,000 coffee workers who earned wages only during the harvest.” The situation wasn’t helped by the fact that hundreds of thousands of Salvadorans were leaving their country to seek economic opportunities in

Honduras. With more competition from Salvadorans, it was even harder for Honduran peasants to find jobs in the cities. So—let’s quote a great passage:

...National campesino movements emerged to fight bared-wire and other incursions by the oligarchy. The new groups reoccupied land in force. The landowners promptly organized FENAGH (National Federation of Agriculturalists and Cattle Ranchers of Honduras) to discipline the peasants. FENAGH focused on attempts to turn poor Hondurans against the incoming poor Salvadorans. This tactic should have been effective since the latter took jobs and land from the former. But it failed. In a surprising turn, the campesinos banded together to protect each other. In one of many defiant gestures, the peasants moved back into the former lands in Choluteca, announcing that the enemy was not Salvadoran, but their own country’s system...

But in 1969 the “soccer war” erupted:

...When a soccer match between Salvador and Honduras ended in a bloody riot, Lopez’s government [in Honduras] seized the opportunity to expel all Salvadorans. War broke out between the two nations. It ended after both sides suffered heavy casualties and the Central American Common Market began to break down. But FENAGH achieved its objectives. Ruthlessly expanding its export-crop operations into land long held by peasants, FENAGH finally succeeded in destroying united peasant opposition through the war against El Salvador.

FENAGH, however, had to share the benefits with the already autonomous and virtually supreme Honduran army. The Alliance had set out to develop Honduran society, but ended by creating a highly efficient military force. The Alliance helped make such a force necessary, for the program’s failure to diversify the Honduran economy led to an expansion of an export economy. That expansion in turn took lands from campesinos and set the class war in motion. The Alliance’s post-1963 emphasis on private investment worsened the growing crisis, for it increased the nation’s indebtedness, lessened Honduras’s control over its own economy, paradoxically pulled wealth from the country while doubling U.S. investment, and—in all—helped create conditions that could lead to revolution.

In Guatemala, as elsewhere, no substantive land reform or tax reform occurred. Foreign capitalists were reluctant to invest because of political uncertainty, corruption, an unstable currency, and the small size of the internal market, but the little investment that did enter went into a few large firms that concentrated on exports, not on developing the domestic market. “Foreign-owned firms dominated the country’s export trade. Taking control farther out of Guatemalan hands, they further skewed an already lopsided economy. Labor unions were impotent...” Insurgencies erupted in the 1960s, provoking brutal responses by the army that the U.S. had largely created since the mid-fifties. In fact, the military was ready to govern the country by 1963. “A military whose officers before 1954 had been attached to individual politicians became by the sixties an institutional force dedicated to its own preservation and prosperity. Its political tentacles reached down to the village level. From this point at least through the early eighties, Washington officials expressed severe reservations about the tactics and ambitions of the Guatemalan army, but they could do less and less about it. They were losing control of their own monster.” On a less official level than the army the repression was even more brutal: private right-wing groups formed their own units to torture and murder students, Indians, and labor leaders suspected of sympathizing with the rebels. Military officers became major landholders themselves and formed close relationships with reactionary economic factions. To save himself, the civilian president gave the army total freedom to attack its enemies, which led to a bloodbath between 1967 and 1970.

In retrospect, the early 1970s were “the calm after the storms from the Alliance in the sixties, and before the terrors of revolution in the late seventies.” Regimes seemed solidly in power. Nixon stepped up military aid to dictators (increasing their public debt). But the OPEC price shock proved devastating to Central American economies that were already at the breaking point because of rising military expenses and the enormous debts incurred to pay for the Alliance of Progress programs. “As money drained out of these small economies, they soon lacked the means to pay for U.S. food and industrial goods.” With a growing urban proletariat, revolutionary pressures accumulated. Carter tried to punish Central American regimes for human rights abuses by cutting off military aid, but they responded by buying weapons from West European and Israeli suppliers and growing even more repressive at home. As the U.S. did little to change the terrible economic and political environment in Central America, Mexico and Venezuela, which had benefited from the rise in oil prices, emerged as relatively progressive counterweights to U.S. policy in the region.

But a more significant change was the rise of liberation theology. Consciousness-raising among the peasantry, base communities in the countryside to work with peasants, etc. “In Nicaragua, priests were instrumental in the revolution. At a critical moment they played the major role in transforming a narrow Marxist movement into a more moderate, broad-based, and powerful force. In Salvador, Archbishop Oscar Romero became increasingly critical of government-supported vigilante groups and the atrocities committed by the military. One group of Jesuits led the first strike in history in a large sugar mill and worked closely with a peasant union that supplied soldiers and supplies for a guerrilla unit.” And so on. Of course all these priests were the target of violence.

I won’t describe the course of the revolutions in Nicaragua and El Salvador. Will just note that Carter had a confused and ineffective policy towards them, at times denying military aid to the reactionary regimes and at times not. Supported Somoza until the end, then tried to get members of the barbarous National Guard into the Sandinista government. Gave military aid to the sadistic Salvadoran army in 1980. As for Guatemala, a huge earthquake in early 1976 played a role in the uprisings. Before 1976, the Indians who made up half the country’s population had started to see their villages and traditions be destroyed “as the oligarch-military group seized Indian lands that seemed fertile or a likely spot to drill for oil. The army also brutally regimented villages in anti-guerrilla campaigns. In its rapacity, the government had thus not only opened up the Indian communities but also had made them enemies. The failure of the government to rebuild the villages after the 1976 earthquake only added to already great misery.” LaFeber continues:

But the Indians had begun to organize. International relief agencies appeared on the scene after the earthquake to do what the government refused to do, subjecting many villages to new political influences. Local priests provided leadership... For the first time in centuries, the Indians began to organize for a struggle. The country’s political wars no longer involved merely one army faction against another. The revolutionary movement threatened to become a mass uprising.

The economic crisis of the late seventies sharpened the conflict. Coffee and sugar earnings dropped more than 45 percent... But prices of such vital imports as food and energy soared. The poor not only became poorer, they also lost their land. Oil companies had started major exploration efforts in the early seventies... The oil discoveries set off a scramble for land in northern areas—precisely the region where revolutionaries grew in number. Mining of tungsten, nickel, and other minerals also focused on territory long held by Indians and other campesinos. Multinational corporations, in league with the Guatemalan military, forced people off land they had possessed for centuries...

Urban laborers trying to unionize were also subject to government violence. Rival factions of the elite even started killing each other as they competed for the country’s land and mineral wealth in the context of an economic crisis.

As you know, American policy went downhill with Reagan. “Control of Central American policy was a payoff to militant conservatives for their support of Reagan. [Alexander] Haig and [Thomas] Enders

realized they had to throw a bone to the right-wingers,' a conservative Senate staff member observed. 'They can't have the Soviet Union or the Middle East or Western Europe. All are too important. So they've given them Central America.'" The resulting history is too nauseating to relate, so I'll end here. The product of the 1980s was an utterly devastated region that has yet to escape from crisis and unimaginable misery.

Was listening to Billy Joel's song "She's Always a Woman" on YouTube, with a beautiful accompanying video of black-and-white photos of exemplars of the sex. Angels. Saw a comment, sad but respectful, hiding a story behind it—poetry: "This song reminds me of the love of my life. She is an amazing, strong intelligent beautiful woman. As much as it hurts to never hear her voice again, I am so lucky to have known her. She carelessly cut me.¹ Out of her life. But she is the one for me. I could be with a million women, and I know it wouldn't be right. It was her. She was way too good for me. I miss her. Wish I could hear her amazing laugh again. She ruined women for me." The bittersweet poetry of life, of living.

Here are excerpts from a few random emails between an Italian friend and me: [*I deleted a couple of them*]

(She read the introduction to my dissertation and wrote some comments on it. Evidently its arguments went in one eye and out the other. Here are a couple excerpts from the emails.)

(Her.) ...Generally speaking, I had the impression that you should give readers further evidence. You'll probably have it, so you should just re-organize your arguments in a more convincing way. As you may have noticed, I tend to sympathize with Marxism and Marxists, meaning with class interpretation of historic phenomena. I believe, though, that historians should be very prudent in using Marxist categories, because I think that Marxism is not science. Although postmodernists seem to disagree with what I'm about to saying, history is a science, with its rules and (more or less conscious) limits. This means that there is a scientific method historian should follow in order to research and write about history. One of the rules that concern us is to avoid bias and prejudices as more as possible (completely is obviously impossible and counter-productive). I fear that to apply the Marxian scheme to a study can be both useful and dangerous. Useful because it helps us adopt a stimulating perspective. However, I also think that using this tool alone can reproduce bias. I don't think that class struggle is the only universal way to explain phenomena, and there've been lots of studies that show it. The world is a complex system of which we don't know all the variables. We can approximate and Marxism may be a good tool to do that, sure. But I don't know, I always fear I'm losing something when I adopt an exclusively-Marxist point of view. Variables such as religion, sex and others play also a role, a role that often is not secondary as Marxism suggests. So I'd be much more prudent than you in framing my research as "Marxist"...

(Me.) ...Regarding Marxism, I agree it's not a science. It's a 'method,' a way of explaining society scientifically, or at least in as 'scientific' a way as can be done in the humanities and social sciences (which are much less 'scientific' than, say, physics). [...] 'Marxism is biased, only one approach among many, etc.' But this is exactly what I was arguing against in the piece, this almost universal, relativistic, postmodern way of thinking among intellectuals (a way of thinking that effectively serves to uphold capitalism and its ideologies). And it's why I included the long Chomsky quotation that you didn't find convincing. -Here's one way to think about it: if, as you say, history is a science, then we ought to do history in a scientific way. So what is the scientific method? Basically, formulate an explanatory hypothesis and then argue for it by invoking evidence and logic. It so happens that historians rarely do this; instead, they just describe things that happened, interpret things that happened from a variety of different perspectives. "This happened, then

¹ Reference to a lyric in the song.

this happened, and somebody thought about it in such-and-such a way, and it was gendered and also racialized, and a few other things happened...' Well, that isn't science in the strict sense. There is no hypothesis to be tested (except an intellectually insignificant one, e.g., such-and-such ideologies were important, or so-and-so was a significant figure in the history of such-and-such, etc.). There is no *explanatory* hypothesis, only, sometimes, a *descriptive* one (or more than one), and nearly always a vague and not-very-interesting one that serves merely as an excuse to amass and present a lot of data. This is what Chomsky has in mind when he says (in the quoted interview), "if you tried to do that in the sciences, you wouldn't even reach the level of Babylonian astronomy." You have to *explain* the data, which means applying certain hypotheses to it, such as historical materialism does.

In other words, what I was doing in the introduction was precisely to explain how history *can be* a sort of science. I set forth a couple of (Marxian) hypotheses, explained in an *a priori* way why they are of unique explanatory power, mentioned some scholarship that provides evidence to support my claim, and then said I'd provide further evidence in the dissertation. That is exactly how a scientific endeavor should proceed. The postmodernist 'epistemological relativism' of your statement that Marxism is only one way of interpreting society among many others is exactly *anti*-scientific, because, as Chomsky says in the quoted passage, the essence of science is to identify major principles, secondary principles, tertiary ones, and so on. In order to really understand something you can't do the politically correct thing of treating several interpretations as equally valuable; you have to rank their explanatory power, their relevance, etc. And what I'm arguing is that the Marxian schema is of greater power and relevance to my subject matter than considerations of gender, sexuality, and race are. That's an unfashionable argument to make, but I think that usually it's the unfashionable interpretation that is the best one.

Of course I do bring in considerations of race and gender, discussing them in some depth--class is obviously not *everything!*--but I treat them as what they are, secondary to class. (For example, as I mentioned, you can't understand why certain ideologies of race and gender prevail nowadays without invoking objective class structures, inequalities of wealth and power that have caused those particular ideologies to be propagated:

...Even ideologies of race, nation, and gender are largely a product of class—of slavery and its aftermath in the U.S., of European imperialism, of attempts by the Victorian upper class to control working-class women's lives and sexuality. In the case of religious fundamentalism in the U.S., for example, historians have shown that since early in the twentieth century, and especially since the 1970s, conservative sectors of the business community have subsidized right-wing evangelical Christianity in order to beat back unionism and liberalism, which have been tarred and feathered as communist, socialist, godless, etc. More generally, for centuries the ruling class (which is to say the aggregate of those who occupy the dominant positions in a society's dominant mode of production, and so have shared interests) has propagated divisive ideas of race, ethnicity, religion, nationality, and gender in order, partly, to fragment the working class and so control it more easily and effectively...

You can say that Marxian ideas are mere 'biases' or 'prejudices,' but that's like saying any scientific hypothesis is nothing but a bias or prejudice. The theory of natural selection by random variation is just a 'bias.' --And that's what a lot of postmodernists, and Creationists, do say! Are you sure that's the kind of company you want to keep?...¹

¹ Of course the social and natural sciences aren't quite the same, since the latter have the advantage of dealing with a deterministic subject-matter, unlike the former. Questions of interpretation and judgment, "emphasis" and "bias"—"you should say more about race, etc."—therefore are more legitimate in the social than the natural sciences. Nevertheless, one has to be careful about using terms like "bias" to describe materialistic scholarship. For it isn't mere

*

It can be hard to experience a moment of *intuitive understanding* that the self is a fiction, but maybe this will help. Just imagine a person undergoing brain surgery while conscious, the top of his skull removed and his brain showing while he talks so that doctors can make sure they aren't doing any damage. Or watch a video of that on Youtube. When I watch such a video, it strikes me with some force that the self and the mind are mere neurochemical processes, that there is *nothing there*, so to speak. Tongue moving, vocal cords vibrating, lips opening and closing, a billion mini-bursts of electricity in that soft slimy white matter...altogether a puppet with no puppeteer, the puppet somehow its own puppeteer.

And when I think about that, I find less frustrating and bewildering human mediocrity. The lack of free will, the stupidity, the animalistic assholishness, the moral and intellectual cowardice—people are *determined*, mere “secretions of the brain,” brute matter, so it's all rather appropriate.

Here's an example of how things can be interpreted from more than one perspective, and how it can be hard to decide which perspective is better or truer. Writers in the early 1930s remarked that it was very rare to see women in breadlines. It was almost always only men. Why? Some writers attributed it to women's *pride*: women believed that “any public parade of poverty is degrading,” so they tried to make do on their own. From this perspective you could say that women tended to be “prouder” than the men who displayed their poverty in breadlines. On the other hand, you could just as easily say that the explanation is women's *vanity*: they're more concerned about their appearance than men, how others view them, and so would be more likely to feel harsh self-contempt just because others looked at them with contempt as they stood in the line. From this perspective, it's the men who have a more “noble” attitude, not caring so much about how they look but just acting in a rational way (getting bread and soup to assuage their hunger). Especially when it comes to value-judgments like this, you can often (or always?) interpret behavior in two very different ways. So where does that leave us? It would seem that both interpretations have merit: the women *were* proud, after all, too proud to stand in those lines, but they *were* vain at the same time, such that their pride and vanity were inextricably united. They were both more and less “admirable” than the men. Which means...what? That—as sophisticated psychologists will tell you—our value-judgments say more about *us*, our perspectives and backgrounds and biases, than about the person we're judging. There *is* no “reality” in these cases. The very valorization of “pride” and denigration of “vanity” is nothing but a subjective response, a “social construction,” that cannot correspond to reality in the way we think it can.

All of our “discourse” reaches out for objectivity, but an incredible amount of it is just imaginary. (On the other hand, a painstaking analysis might show that an incredible amount of it is indeed objectively true or false.)

Here's something we don't often think about but should: each of us is a universe. A walking, talking universe. Apparently about 37 trillion cells, together with trillions more bacteria, all functioning together in an impossibly perfect cosmic system that, incredibly, lasts not a mere few seconds before it collapses from the impossibility but rather up to a *hundred years or more*. This entity that is orders of magnitude more complex than should be possible. When one dies, an entire universe dies.

June, July

Various articles. Todd Moody, “Distinguishing Consciousness” (1986). Richard Rorty, “What Do You Do When They Call You a ‘Relativist’?” (1997). (Silliness: “What should Brandom's strategy be when charged with a relativistic disbelief in the reality of intellectual progress? The obvious option is Kuhn's: ‘to substitute evolution-from-what-we-do-know for evolution-toward-what-we-wish-to-know,’ thereby

bias that leads Marxists to prioritize class.

switching from progress toward a *focus imaginarius* to improvement on the historical past. This amounts to switching from pride in being closer to Reality to pride in being farther from the cavemen.” As if pride in being farther from the cavemen isn’t precisely a result of thinking that our beliefs are *truer, closer to reality*, than the cavemen’s!) Don Ihde, “Postphenomenological Research” (2008). T. L. S. Sprigge, “Consciousness” (1994). C. Ram-Prasad, “Saving the Self? Classical Hindu Theories of Consciousness and Contemporary Physicalism” (2001). Thomas Nagel, “What Is It Like To Be a Bat?” (1974). (Says some of the same things I said more succinctly in the first few pages of my paper on the mind-body problem. It’s pretty incredible that Nagel’s paper was extremely influential, since the gist of its argument is utterly obvious to anyone who can think straight. But, again, so-called philosophers are little more than institutional role-bearers, so an argument that doesn’t conform to current institutional norms—groupthink—will seem bizarre or revelatory.)

Todd Moody, “Naturalism and the Problem of Consciousness” (2007). Wrongheadedness: “I agree with John Searle that ‘[W]e really have no notion of the mental apart from our notion of consciousness’ (18). That is, what makes a state a mental state in the first place is that at least some states of that type are conscious states. They occur ‘in consciousness,’ as we say. *We experience* them.” Years ago I sometimes wrote as if ‘mental’ and ‘conscious’ were effectively synonymous—because I thought, and think, that the so-called mind-body problem is really the consciousness-body problem (or “mystery,” as Chomsky prefers)—but that was an unjustified restriction of the concept of mental or mind, which is broader than that of consciousness. Nearly all mental activity is not and can not be accessible to consciousness. I don’t know why philosophers dogmatically like to identify mind with consciousness. (Leibniz was already beyond that.)

Martin Morris, “On the Logic of the Performative Contradiction: Habermas and the Radical Critique of Reason” (1996).¹ Like much of this Continental stuff it’s almost unreadable. One is, as ever, tempted to say of all this “critique of reason” crap from Nietzsche through the Frankfurt School to poststructuralists and postmodernists—reason is domination, an expression of power-relations, exploitative, mythological, oversimplifying (“language lies”), irrational, full of gaps and silences and leaps of faith, riddled with all sorts of “dialectical” contradictions and negations and arbitrariness—including Habermas’s attempt to rehabilitate reason or whatever his project was with the “theory of communicative action,” that it’s of little *intrinsic* worth but is significant only as an expression of certain social or institutional pathologies. And clearly one ought to be very skeptical of anything that is apparently so hard to communicate lucidly. But as a semi-Hegelian I’m convinced there must be *some* merit to every major philosophical movement, especially one that, in various forms, has lasted for so many decades. There’s surely something worth salvaging in all this skeptical Continental stuff. Buried in it are important truths. It only needs someone with the ability to think and write clearly and unpretentiously to sort through it and extract the rational kernel. (Ha, irony; I’m so clever.) And I have to admit, when you’re trying to think the limits of reason, the nature of reason, you’re engaged in a rather difficult task.

Thomas Nagel, *Mind and Cosmos: Why the Materialist Neo-Darwinian Conception of Nature is Almost Certainly False* (2012). Unconvincing. Somewhat like Moody’s paper, it assumes that because *to us* the relation between consciousness and matter is utterly mysterious, scientific naturalism—materialism—is fatally flawed. In other words, because we can’t understand how material processes give rise to consciousness (or intentionality or value), materialism must be false. So we have to turn to...something else. The obvious alternative isn’t even considered, namely that the problem isn’t with materialism but with the limitations of human cognition. The fact that we can’t conceive how matter, through evolution, gives rise to mind doesn’t entail that matter doesn’t give rise to mind.

¹ On the notion of performative contradiction, which is a common and obvious criticism of postmodernism and all its forebears, such as Adorno: “a radical critique of reason purporting to show that there exist no theoretical or philosophical ‘foundations’ that can secure the ‘rationality’ of reason beyond its historical, and therefore particular, embodiment, nevertheless performs a ‘rational’ critique by doing so and hence is said to involve a ‘performative’ contradiction of inconsistency.”

Likewise, Moody—and apparently most or all other philosophers of mind—takes it as uncontroversial that there is no *necessary* connection between consciousness and its neural correlates. It's the old Kripkean argument. As Nagel says, "experience of taste seems to be something extra, contingently related to the brain state—something *produced* rather than constituted by the brain state. So it cannot be identical to the brain state in the way that water is identical to H₂O." Or, to quote Moody, "there is nothing about neural states that necessitates their being correlated with conscious states." This leads to the conclusion that, from the perspective of evolution (natural selection), consciousness is inessential. "In terms of detecting the environment and driving behavior, those neural states would be just as good—empirically indiscernible, in fact—even if they were not associated with consciousness, or even if consciousness did not exist at all." So there's no reason why it shouldn't have been zombies that evolved rather than conscious beings (since all that natural selection needs is the neural state; it doesn't need the conscious state contingently associated with it). Thus, "evolutionary theory offers [and can offer] no explanation of why consciousness exists at all."

To refute this argument, all you have to say is that the apparent non-identity of a conscious state with its neural correlate is a reflection of human ignorance. *To us*, yes, consciousness is nothing like a physical state of the brain. But there is no reason to say it *can't* be a particular type of emergent state of the brain. That the experience of taste *seems* different from a brain state doesn't mean it *is* different. Anyway, I answered the Kripkean objection to the identity theory ten years ago or so when discussing *Naming and Necessity*.

(As Nagel says, the Kripkean point is basically Descartes' argument for dualism. "Descartes said that since we can clearly conceive of the mind existing without the physical body, and vice versa, they can't be one thing." And that's true: consciousness is different from the body, from the brain—an extended, massive thing, unlike consciousness—from neurons, etc. But this doesn't mean it has to be different from the emergent state of billions of nearly instantaneous interactions between cells in the brain. It could very well *be* that, since we don't have such a clear intuition about the nature of that sort of emergent state as we do about the body in its massive physicality.)

On alternatives to some kind of teleological explanation of consciousness and cognition (which he favors), Nagel says this: "First, there is the hypothesis that the initial appearance of a code-governed [self-replicating system [i.e., life] that started the evolutionary process was a cosmic accident, and that subsequent accidental mutations provided the set of successive candidates on which natural selection operated to generate the history of life. This hypothesis makes the outcome too accidental to count as a genuine explanation of the existence of conscious, thinking beings as such." Um, what? Why? How? Huh? Because an explanation incorporates an element of chance it isn't an explanation? I have to congratulate Nagel on his discovery of this odd new law of logic.

Liberal Faux-Outrage over Freedom of Speech

One cannot but be awestruck by the hypocrisy of intellectuals who pretend to adhere to points of principle—for transparently partisan ends.

A recent manifestation of the distinguished tradition of elite hypocrisy is Nicholas Kristof's two-columns-long exhortation to liberals and leftists (whom he characteristically conflates) that they be more tolerant of conservatives. Thus he joins a growing army of fellow intellectual luminaries—including Jonathan Chait, Catherine Rampell, Edward Luce, Damon Linker, Greg Lukianoff, Jonathan Haidt, and many others (Jerry Seinfeld, Donald Trump, etc.)—who bemoan the rise of an intolerant political correctness on social media and university campuses.

"On campuses at this point," Kristof laments, "illiberalism is led by liberals." Conservatives often feel discriminated against, are less likely to be hired in certain departments, and sometimes provoke student protests if they're scheduled to give a talk on campus. "[E]ven Democrats like Madeleine Albright, the first

female secretary of state, have been targeted [for protest]," Kristof writes, as if the absurdity and injustice of such targeting are too obvious to merit comment.

In a similar vein, other "liberals" denounce the far left for not respecting the free-speech rights of its opponents. The most obvious example is the wave of outrage that followed Chicago students' shutting down of Trump's rally on March 11. They were denying his right to free expression! "Shutting down Trump rallies is a dangerous, illiberal, self-defeating tactic," Jonathan Chait tweeted, as Senator Dick Durbin (D-IL) admonished activists to take their grievances with Trump to the ballot box, not the barricade. "Confine protests to the marketplace of ideas!" the liberal elite shouted in chorus.

(Evidently this highly educated--indoctrinated--sector hasn't learned one of the clearest lessons of history, that progress happens not through ideas battling it out in some ethereal Platonic realm in the liberal imagination but through disruptive protest, popular struggles sustained over decades and centuries. The very democracy that the intellectual class pretends to cherish and to want to guard against "illiberal" activists was achieved by generations of activists throwing their bodies on the line in challenges to mainstream norms of propriety.)

The proper response to such liberal and conservative complaints about a rising left-wing generation is not to let oneself be dragged into a debate about activists' tactics or the excesses of political correctness; rather, it is simply to point out that rank hypocrisy scarcely deserves a response at all.

The Kristofs and Chaits are right that our society routinely violates the principle of free speech on a massive scale. What they seem not to recognize is that this is nothing new. It has always done so, since before the country's founding. Suppressing free speech is more American than apple pie. The aggrieved, however, have typically not been the Madeleine Albrights and Donald Trumps of the world, or the white male Republicans who don't feel welcome in an anthropology department; they have been the millions of dissenters from mainstream ideologies and institutions.

They have been the workers slaughtered for mobilizing against employers, and the IWW soapbox orators imprisoned for exercising their right to free speech on street corners. They have been the thousands of people locked up for opposing World War I, and the civil rights protesters of the 1960s violently attacked for marching against racism.

They have been the Fred Hamptons murdered by the state for organizing inner-city African-Americans.

More recent examples are not hard to come by. For truly massive and systematic suppression of viewpoints, Kristof need look no farther than his own newspaper. The perspectives of labor unions, for instance, are, as we know, virtually anathema to the corporate media, from the *New York Times* to the *Chicago Tribune*, from CNN to Fox. Were it not for marginal organizations like *Labor Notes*, *In These Times*, and *Nation of Change*, labor stories would suffer an almost complete media blackout. Which amounts to a blackout of the views and interests of tens of millions of people. This counts as rather severe censorship.

Or, if academia is what we're concerned about, consider the countless scholars who have been punished for expressing politically incorrect opinions--incorrect because they were too left-wing. How many of the elite public figures wringing their hands now over left-wing "intolerance" leapt to the defense of Steven Salaita when the University of Illinois fired him for angry tweets about Israel's Gaza massacre in 2014? How many defended Ward Churchill's right to free speech when he was fired for suggesting that some of the victims of 9/11 were complicit in American imperialism? Was Nicholas Kristof publicly outraged when Norman Finkelstein was denied tenure at DePaul for repeatedly criticizing Israel?

Who criticized MIT when its political science department denied Thomas Ferguson tenure explicitly because of his materialistic scholarship? (See *Understanding Power*, p. 243.) Which *New York Times* or *New Republic* intellectuals were scandalized by academic persecution of the brilliant materialist historian David F. Noble?

In general, it is hardly news that elite intellectual culture suppresses writers and ideas on the political left. How friendly, after all, has the mainstream media been to pillars of the left from Noam Chomsky to Glenn Greenwald (not to mention leftists without such name recognition)? The obviousness

of these points, however, doesn't mean we shouldn't call out the guardians of ideological orthodoxy on their hypocrisy and cowardice when they publish columns like Kristof's "The Liberal Blind Spot."

The proper course of action for people who genuinely care about free speech and healthy intellectual debate--i.e., who are not cynically exploiting the issue for ideological ends--is to defend, first and foremost, the free expression of the relatively powerless, not the powerful. It is sheer farce to complain about the occasional mild "censorship" (by a few university departments or students) of businessmen, politicians, conservative intellectuals, and racists if one does not first devote overwhelming attention to the systemic censorship of anti-establishment views.

So, to sum up, the appropriate left-wing response to the emerging fad of denouncing "political correctness" for its alleged shutting down of debate is to tell the whiners, "Yes, you have the right to speak, but until you defend free speech consistently and on *principle*, you don't have the right to be taken seriously."

*

Reading Bruce Nelson's *Workers on the Waterfront: Seamen, Longshoremen, and Unionism in the 1930s* (1988). Harry Bridges was awesome, at least before World War II.

Here's something I've never seen addressed or even mentioned by any scientist or cognitive psychologist (except indirectly): how can one possibly connect the domain of cognitive structures, computations, and so on to the domain of neurobiology? There seems no way to do so, no way to explain how mental structures arise out of biological processes. How can you even go about studying that (the instantiation of these higher-level structures in neural processes)? I guess this is basically just the "explanatory gap," i.e., the mind-body problem, but it seems like a somewhat different angle on it. Where do you even begin in trying to find out how the brain makes computations? There's no starting-point! The only biological data we have are...neural structures, electrochemical impulses, and the like. How do you get from *that* to—computations? Or, for instance, where do you even begin in trying to explain why people are mentally different from each other—why one person is good at math, another at poetry, etc.? How are those sorts of things coded in cells (or in interactions between cells)? How can you go about *finding out* how they're coded in biology? Like, *what is going on* when certain cells specialize in one area, other cells in another area?

The only person I've seen come close to making some of these points is Chomsky. Not surprisingly. He also seems to be one of the few who appreciates how inconceivable it is that brain scientists will ever be able to explain *choice*. There's no apparent way even to address that problem. When you decide to do something...there's no way to investigate what's going on. (How the impulse originated, how it was 'decided upon,' etc.) Partly because, in fact, there's no way to investigate how a thought is manifested on the neural level. Or, rather, how neural impulses give rise to a specific thought. There's no way to show how biology produces *meaning*.

In other words, while to some extent we can discover neural correlates, we can't really *explain* anything having to do with higher mental processes.

Sophie Wahnich's *In Defence of the Terror: Liberty or Death in the French Revolution* (2003/2012). A thoughtful and imaginative historico-philosophical analysis, "defending" the Terror (and the September massacres, etc.) by contextualizing it in terms of its emotional logic, so to speak. But not just emotions, also certain aspects of the revolutionary value-system, as well as immediate political circumstances, of course. Wahnich makes it clear that any simple or reflexive condemnation of the Terror is ignorant and ridiculous. For instance, in part it was a way of *controlling* and *limiting* violence, by making it unnecessary for the people to engage in massacres like those of September 1792 in order to avenge wrongs that oppressors and counterrevolutionaries had committed against the *patrie*, against liberty and justice. Henceforth (as the revolutionaries saw it) it would be the revolutionary tribunal, not the people, that would carry out the terrible duty of avenging wrongs against humanity and protecting the *patrie*. And if there were no tribunal to do that, it was thought that the people might well take matters into their own hands again and be even more violent. —Anyway, aside from all this, it's rather easy to defend the Terror, except for the

Great Terror after 22 Prairial. France, and particularly the Republic, was in a moment of extraordinary crisis. Even just considering the enormous pressure from the *sans-culottes* for such a policy, the Terror was probably necessary for the survival of the regime. And it facilitated the victories in the foreign wars and civil wars.

(It seems to me that the common comparison of the Terror to Soviet totalitarianism or the Gulag is problematic. The social contexts, political contexts, and “symbolic universes” were quite different. Doubtless one can find resemblances, but how meaningful they are is another question.)

Random interesting quotation from René Girard: “The penal system has no principle of justice essentially different from the principle of vengeance. The same principle is at work in both cases, that of violent reciprocity or retribution. Either this principle is just, and justice is already present in vengeance, or else there is no justice in either case. The English expression for vengeance is that someone ‘takes the law into his own hands.’” That seems rather true. The other obvious principle of the judicial system is rehabilitation, but mere rehabilitation without punishment is surely not justice. Some sort of reciprocity or retribution is necessary, so as to honor the outraged dignity of the victim.

Wahnich: “The revolutionary Terror, which is attacked for its revolutionary tribunal, its law of suspects and its guillotine, was a process welded to a regime of popular sovereignty in which the object was to conquer tyranny or die for liberty. This Terror was willed by those who, having won sovereign power by dint of insurrection, refused to let this be destroyed by counterrevolutionary enemies. The Terror took place in an uncertain struggle waged by people who tried everything to deflect the fear felt towards the counterrevolutionary enemy into a terror imposed on it. This enemy, for its part, tried everything to bring the Revolution to an end. The greatest danger was then that of a weakening of the revolutionary desire—a discouragement, a corruption of the founding desire. It was this danger that haunted those actors most committed to the revolutionary process.

“This is why the Terror was a deliberate self-constraint: it was not just a policy of arbitrary violence or extreme fear to intimidate its enemies. [In other words, the thinking was ‘We have to terrorize, however inhumane it may be, in order to stay committed to the revolutionary ideals, to not soften or fail!'] It was the historic moment when the sovereign violence of ‘making die’ was that of a people driven to make use of it to maintain the extraordinary claim to have conquered sovereignty.”

In the case of the Terror, as in the case of many other political contexts, a purely materialistic analysis won’t do. One has to bring in symbolism, idealism, ideology. There was a definite class element, but that wasn’t everything.

Karl Kautsky’s *Foundations of Christianity: A Study in Christian Origins* (1908). Quite good. Despite his flaws and mistakes (both intellectual and political), Kautsky was a remarkable person and a serious scholar. —Of course there’s a certain primitiveness, compared to present-day “sophistication,” in his scholarship and writing, but there’s also a directness, a bluntness, and a relative profundity and pithiness of thought. Intuitive insights, breadth of thinking, bold materialistic hypotheses suggested in passing. (But it’s unfortunate he used the terminology of an ancient “proletariat” in his analysis of Christianity, since that made possible the willful misrepresentation of his work by later anti-Marxists. Not only was he perfectly aware that what he calls the Roman “proletariat” had very little in common with the modern industrial working class; he actually insisted on it. Nothing is more foreign to Marxism than a drawing of straightforward parallels between the present and the distant past.)

Interesting discussion of the Pharisees, Sadducees, Essenes, and Zealots. The Zealots! I’m a fan of the Zealots. Rebels, insurrectionists, against the incredible oppression of the Romans, though they were inevitably defeated in 70 A.D. when Jerusalem was destroyed. “Not the entire Jewish population of Jerusalem continued for three years, until September, 70 A.D., to fight the hopeless battle against the superior army in the bravest, most obstinate and most brilliant manner, covering every inch of ground with corpses, before it yielded, exhausted by famine and disease, and was consumed in the burning ruins. The priests, the scribes, the merchants, had for the most part found safety early in the siege. It was the petty artisans and shopkeepers as well as the proletarians of Jerusalem who became the heroes of their nation, together with the proletarianized peasants of Galilee who had cut their way through to Jerusalem.”

Judea in and after the time of Jesus was a land of misery and rebellion, so it isn't surprising that the early Christians were inspired in part by class hatred. You can even see this in the Gospel of Luke and the Epistle of James. With some justice, Kautsky says, "Few are the occasions on which the class hatred of the modern proletariat has assumed such fanatical forms as that of the Christian proletariat." By the time of the Gospel of Matthew, which, according to Kautsky (and he might be wrong), was written decades after Luke's, the element of class hatred had to be minimized, since "wealthy and cultured persons had begun to seek contact with Christianity, and many a Christian propagandist began to feel the need of putting the Christian doctrine more amiably in order to attract these people." So whereas Luke says, e.g., "Blessed be ye poor: for yours is the kingdom of God. Blessed are ye that hunger now: for ye shall be filled; blessed are ye that weep now: for ye shall laugh...but woe unto you that are rich: for ye have received your consolation; woe unto you that are full! for ye shall hunger. Woe unto you that laugh now! for ye shall mourn and weep," the Sermon on the Mount takes a different form in Matthew. "Matthew has Jesus say: 'Blessed are the poor *in spirit*, for theirs is the Kingdom of *Heaven*... Blessed are they who are hungry and thirsty *for justice*, for they shall have their fill.'" Ha! They'll have their fill of justice. Ridiculous bowdlerization. Especially since "the Greek word translated by 'have their fill' was used mostly of animals, being applied to humans only in a contemptuous or ludicrous sense to designate a base mode of stuffing one's belly. The fact that the word occurs in the Sermon on the Mount also is a suggestion of the proletarian origin of Christianity, the expression having probably been current in the circles from which it was drawn, to indicate a full appeasement of bodily hunger. But it becomes ridiculous when applied to the satisfaction of a hunger for justice."

How likely is it that these points are made by any contemporary mainstream Biblical scholars?

There's also some fascinating detective work in Kautsky's rather persuasive argument that Jesus was actually a violent rebel, a Zealot or some such person. Arguments about the clumsy editing of the Gospels by later Christians who wanted to shape Jesus into a peaceful, politically submissive figure. The incredible contradictions of the New Testament are partly a result of this reshaping of Jesus.

Interesting analysis of the story of Christ's passion. Kautsky's dissection of it starts with the split between the original Jewish Christians and the pagan Christians. For many reasons there developed hostility between them, and the pagan Christians shed much of the Jewish background of Christianity. After the destruction of Jerusalem, the pagan (more "universalist") version triumphed and the nationalistic Jewish version died out. But since there was now no provincial center of resistance to Rome (as Judea had been), and since the particularly rebellious Jewish Christianity disappeared, Christianity became ever more submissive, even servile, towards the Romans. ("Render to Caesar the things that are Caesar's," etc.) Jesus had been crucified probably because he had tried to foment violent rebellion against Rome; that is, the fault lay with the Romans, not the Jews. But the pagan Christians wanted to be on good terms with Roman authorities, so they had to twist the story around and blame the Jews for Christ's crucifixion, not the Romans. But why would the Jewish masses have any reason to want Jesus dead? He said he was the king of the Jews, which is to say their leader in the struggle for independence—which the masses desperately wanted, because they hated their Roman masters. Jesus was on their side (even if he was not in fact a very successful or famous leader). For Pilate, though, the case was clear. "As a representative of the Roman power, he was merely doing his duty in having the rebel Jesus executed."

The account in the Gospel, on the other hand, is absurd. It was unheard of that an official of the emperor would ask the masses of the people what was to be done with the accused. Pilate thought Jesus was innocent and yet had him killed just because a dirty rabble demanded it?! "Matthew assigns a most ridiculous role to Pilate: a Roman judge, a representative of the Emperor Tiberius, lord of life and death, begs a popular gathering in Jerusalem to permit him to acquit a prisoner, and on their deciding negatively, replies: 'Well, slay him, I am innocent of this blood!' But no quality could more violently contradict that of the historical Pilate than the clemency suggested in the Gospels. Agrippa I, in a letter to Philo, calls Pilate 'an inexorable and ruthlessly severe character,' and accuses him of 'corruption, bribery, violence, theft, manhandling, insults, *continuous executions without sentence*, endless and intolerable cruelties.'" The central government at Rome even had to recall him (in 36 A.D.) because of his ruthlessness! "And we are asked to believe that this man was exceptionally just and kind in the case of the proletarian seditionist Jesus,

besides showing a degree of consideration for the wishes of the people that was of fatal outcome for the accused!”

Kautsky continues to expose the absurdities of the story in masterly fashion. His points are almost numberless, but here are just a few more:

The evangelists depict for us a mob that hates Jesus to such an extent that it would rather pardon a murderer than him; the reader will please remember, a *murderer*—[apparently] no more worthy object of clemency was available—and is not satisfied until Jesus is led off to crucifixion.

Remember that this is the same mob that only yesterday hailed him as a king with cries of hosanna, spread garments before his steps and greeted him jubilantly, without the slightest contradicting voice. And it was just this devotion on the part of the mob that constituted—according to the Gospels—the cause for the desire on the part of the aristocrats to take Jesus’s life, also preventing them from attempting to arrest him by daylight, making them choose the night instead. And now this same mob appears to be just as unanimous in its wild, fanatical hatred against him, against the man who is accused of a crime that would make him worthy of the highest respect in the eyes of any Jewish patriot: the attempt to free the Jewish community from foreign rule.

And how did this astonishing mental transformation take place? Luke and John give no explanation, and Mark only says, “The high priests incited the multitude against Jesus.” (That’s basically what Matthew says too.) Somehow, with no motive at all, people were manipulated into violently hating the man they had practically worshiped the day before.

But, after these remarkable fictions invented by the evangelists to present the Jews as the most evil scum of humanity, the original, true story peeks through for a moment: “Jesus is derided and maltreated by the soldiers of the same Pilate who has just declared him innocent. Pilate now has his soldiers not only crucify Jesus, but first has him scourged and derided as King of the Jews; a crown of thorns is put on his head, a purple mantle folded about him, the soldiers bend the knee before him, and then they again beat him upon the head and spit on him. Finally they place upon his cross the inscription, ‘Jesus, King of the Jews.’” *These* things probably really happened, and were too deeply rooted in the oral history to be deleted by the writers of the Gospels. Here the Romans again appear as Jesus’s bitter enemies, “and the cause of their derision as well as of their hatred is his high treason, his claim to be King of the Jews, his effort to shake off the Roman yoke.”

Since the story of Christ’s passion has been of incalculable importance in causing Jew-hatred for two millennia, the original Christian writers who framed it in that way (during a time of universal hatred and persecution of the Jews—so their invention didn’t come out of nowhere, and was widely accepted) have a lot to answer for. Including the Holocaust.

September–December

In Manhattan. [I moved to New York to escape Chicago.]

Staughton Lynd’s classic *Intellectual Origins of American Radicalism* (1968). Thoughtful philosophical analyses that set the Declaration of Independence in its Enlightenment context. It was a somewhat Lockean document, but not entirely. “In the mid-eighteenth century (as in the mid-twentieth) a sophisticated social science viewed with amused contempt any argument which failed to recognize that what is held good in one culture may be considered bad by another: that ethics are determined by environment. The ‘best minds’ of the Enlightenment came to believe that the state of nature, the social contract, and the rights of man—in short, the apparatus of John Locke’s political philosophy—were human inventions. To grasp the significance of the Declaration as a source of revolutionary ideas one must first grasp equally firmly that from the standpoint of the ethical relativism of a Montesquieu, Voltaire, or Hume

it seemed a piece of provincial propaganda, charming perhaps, but founded on fiction and unworthy of serious intellectual attention. It is not untrue to say that the language of the Declaration is the language of Locke; but to say no more than that ignores the fact that by the third quarter of the eighteenth century the natural rights philosophy had been seriously called into question, and required to be restated in a way that incorporated the insights of its critics. The distinctive qualities of the Declaration are the product of that struggle.”

Locke’s old ideas were remodeled by Revolutionary radicals. “Locke, who blamed poverty on the poor, sought to protect all forms of property including chattel slavery, and took it for granted that government must be the business of educated gentlemen, would have been horrified to find his doctrine turned [by, e.g., Thomas Paine] toward the advocacy of common sense, government by common men, finally even common property.” How did that transformation take place? The preparatory steps occurred mainly in England, “among a group of radical Englishmen associated with non-Anglican (Nonconformist or Dissenting) Protestant denominations such as the Quakers, to whom Paine’s father belonged. These men transferred to secular political discourse that reliance on the individual conscience of uneducated men for which they had contended in religion. Above all they broke with the Lockean thesis that man is the passive product of circumstance, and affirmed what they liked to call ‘the dignity of human nature.’” People like James Burgh, Richard Price, Joseph Priestley (whom Chomsky’s fond of), John Wilkes, Granville Sharp, and Thomas Paine. After 1774, the Dissenters’ pamphlets and other works—*Common Sense* was one of them—“appeared everywhere in the colonies.”

The background is that “roughly halfway through the eighteenth century, there took place a pervasive intellectual crisis based on the perception that Locke’s environmental psychology contradicted his political philosophy.” That point actually seems plausible. How can there be a law of nature “writ in the hearts of mankind” making it self-evident that all people are equally possessed of inalienable natural rights—as Locke said in his *Second Treatise of Government*—if, according to Locke’s psychology, people don’t have innate or intuitively perceived moral or intellectual ideas? One of these propositions had to give way. It turned out to be the first one. “Stimulated by Locke’s environmental psychology as by the economic determinism of James Harrington, English political philosophy in the eighteenth century turned away from natural rights toward a social science characterized by ethical relativism and pragmatic accommodation to existing reality.” Hume’s political conservatism is a good example. Sophisticated economic determinism and relativism pushed aside, to some extent, the whole realm of the ethical. In fact, even Locke’s system was essentially based on property rather than conscience. So the Dissenting neo-Lockeans of the eighteenth century were obliged to reintroduce the ethical dimension. “They insisted on the reality of the good and on man’s ability to recognize it, defended the intuitions of the heart against the paralyzing analyses of the head.”

What this meant in practice was that they reached back beyond Locke to the religious republicans of the 1640s and 1650s, such as Gerrard Winstanley and Richard Overton. “The ascendancy of Dissenting radicalism represented a return to an essentially religious outlook,” as opposed to the secular outlook of Locke, Harrington, and their popularizers. Locke’s empiricist psychology was rejected. Discussing Richard Price, Lynd says, “confident intuition of a universal moral order made by nature’s God was the preamble to the political faith of the Dissenter, as of the subsequent Declaration of Independence.” It was a sort of rationalist intuitionism, so to speak, that inspired the Dissenters, which explains why they were fond of the earlier British Platonists. What was original to the Dissenters—or so Lynd says—was that they secularized the older defense of religious freedom of conscience, turning it into the Rights of Man. “Conscience, relegated by Locke to the periphery of a society based on property, became the critic of all social orders.” It was the inner light that God had given men for guidance. —In some ways we’re back to the Reformation, the turn from external authority (here, property) to inner faith (here, intuition of self-evident moral truths).

Lynd argues that in France, Rousseau played an analogous role to the Dissenters. I’d say he certainly did much to usher in a more libertarian sensibility. But in general, of course, the whole zeitgeist of Western Europe and America at this time was turning toward libertarianism, anti-authoritarianism. Various ideological rationales were found for this, depending on the particular cultural and intellectual heritage.

“As the American Revolution drew near, the Dissenters’ faith in the capacity of the poor for knowledge grew together with their insistence that the poor should vote.” As John Cartwright said in 1776, “*common sense*” was what enabled the “laboring mechanic and the peasant” to understand natural law and natural rights. To quote Lynd, “a belief in intuitively self-evident moral truth became associated with a belief in equality. All men came to be considered capable of perfection because every man was born predisposed to a correct intuitive knowledge of the essential truths. The words with which Rousseau began his *Émile*—‘All is well when it leaves the hands of the Creator of things’—were echoed during the American Revolution by Price, who affirmed that equality was a right with which men came ‘from the hands of their Maker,’ as by Paine, who said that the revolutionary constitution of Pennsylvania considered men ‘as they came from their maker’s hands.’” And so we get the Declaration’s declaration that, self-evidently, men are created equal.

And then comes the statement that they’re endowed with certain inalienable rights that governments are created to secure. “What was striking about this formulation was its failure to mention rights given up in the process.” That was the point, after all, of traditional formulations of the social contract: certain rights that individuals enjoy in the state of nature are given up so that governments can securely protect other, presumably more important rights. Effectively, then, the Declaration abandons the notion of the social contract. To explain how this result comes about, Lynd discusses Priestley’s libertarian ideas on education, which were formulated in opposition to the moralistic authoritarianism that an Anglican minister named John Brown had articulated in the 1750s. “The essential difference between Brown and Priestley is that the tradition which passes from Priestley through Paine and Godwin to Garrison and Thoreau insists that men can and must *free themselves*, rather than *be freed* [or be indoctrinated with ‘virtue’] by the external manipulation of educators and planners.” Priestley then translates (in 1768) his ideas on education into political philosophy, concluding that government powers must be severely circumscribed for the sake of people’s “civil liberties” (or their enjoyment of their natural rights). (On the other hand, he also was inclined toward utilitarianism: “the good and happiness of the...majority of the members of any state, is the great standard by which every thing relating to that state must finally be determined.” Only through experiments can it be determined how far the power of the legislature should extend in order to promote the good of the whole. –Sensibly, Priestley believes that both liberalism and utilitarianism (to use anachronistic terms) are necessary.)

Richard Price went even farther than Priestley, arguing that people in society don’t surrender any of their natural rights at all (whereas Priestley had still thought they had to give up *some* of their “natural liberty”). It seems that these natural rights/liberties are primarily those “of thinking, speaking, forming and giving opinions,” to quote Paine. (Things that have some relation to freedom of conscience, not surprisingly, in light of the religious background of many of these guys.) After his presidency, Jefferson was still saying that “the [common] idea is quite unfounded, that on entering into society we give up any natural right.” The only purpose of government was to enforce our natural rights and duties (as he put it), “and to take none of them from us.”

Early and later abolitionism drew on all this. “The idea of a natural law self-evident to the common man; the idea that liberty was man’s inalienable right to self-determination [as opposed to his right to dispose of his property as he chose]: these were the axioms to which abolitionism added only corollaries. Down to Civil War and Reconstruction, abolitionists quoted the same natural law theoreticians cited by the Dissenters in contending, as the Dissenters had, ‘that an immoral law cannot be valid.’ Indeed the religious fervor of abolitionism was closer in spirit to Dissenting radicalism than was the cool deistic religiosity of the Founding Fathers...” That so much of this Enlightenment libertarianism and emphasis on human dignity was justified by appeal to the Bible is a bit ironic—but not very surprising, in light of Marx’s insight that new phenomena in history typically feel the need (so to speak) to justify themselves by invoking supposed older traditions. Only after the new ideas and practices have become widely accepted is the ancient justification discarded or forgotten.

Like some other European intellectuals, in the second half of the eighteenth century the Dissenters gradually became more radical on questions of property and wealth. One common argument was that since God had given the earth to mankind in common, individuals did not have a right to unlimited accumulation

of land or wealth. Another was specifically about inheritance: the inheritance of private property should be just as subject to social regulation as the inheritance of political power. Jefferson was particularly fond of this argument. He didn't think that property was a natural right at all; it was only a social convention. Of course all this radicalism had definite limits, and these guys were nothing like socialists or communists. Still, they did "demythologize" private property, which may have helped lay the ideological groundwork for socialism and communism (which were already being proposed in the French Revolution).

—To be honest, I don't think these writers, or any writers, are as important as we might think. But in the aggregate of their dozens or hundreds, and in the context of social trends for which they serve as spokesmen, they can indeed have some influence.

"Both in England and America, eighteenth-century questioning of private property in the name of natural rights evolved continuously into early nineteenth-century questioning from the standpoint of a labor theory of value. Without exception the 'American forerunners of Marx' still spoke the language of natural rights." Cornelius Blatchly, for example, listed among man's inalienable rights "his perfect right to the full fruits of his own honest ingenuity and labor," and maintained that "no man by entering into civil government should be abridged of any equitable right to nature." With these writers, Jeffersonian language was used to argue for more-than-Jeffersonian ends (such as the abolition of slavery), as a few decades earlier Lockean language had been used to argue for more-than-Lockean ends. Later, the Radical Republicans pressed for confiscation and division of plantations, thus denying that property is sacred. Even more radical was Henry David Thoreau, who in a sense shared the early Marx's conception of alienated labor. "Men have become the tools of their tools," Thoreau wrote. "The laboring man has no time to be anything but a machine." Obviously both Thoreau and Marx were heavily influenced by writers like Wilhelm von Humboldt and other such liberals and romantics. In some respects the traditions to which Marx and Thoreau belonged overlapped. Similar tendencies of the Enlightenment, except that Marx also drew on Hegel, French socialism, and British political economy, while Thoreau, like all the Transcendentalists, was strongly influenced by (non-mainstream, Enlightenment-inflected) Protestant religion.

It really is striking to what extent *religion*, or at least doctrines with the tincture of religion, provided the ideological justification for dissent in these years, from the American revolution to anti-poverty activism to (especially) abolitionism. The Enlightenment was far from exclusively secular.

The Quakers are an example. "Just as the insistence of Dissenters on freedom of conscience proved the key to the thought-world of late eighteenth-century radicalism, so Quakerism [with its emphasis on an 'inner light,' which was 'that of God in every man'] most clearly exhibited the constellation of attitudes at the heart of radical abolitionism. Emerson and Bancroft ascribed to George Fox their belief in the common man's capacity to perceive the truth by unaided intuition. Garrison, charged by the churches with irreligion, discovered in Quakerism a religious tradition with which he could identify." Even Lincoln had a strong affinity for Quaker sensibility, which by the 1840s or earlier had been assimilated into mainstream American culture. For instance, a group of Friends in Ohio developed in the early 1820s "a synthesis of the Biblical and natural rights arguments" that held slavery not only wrong but un-republican. William Penn's biographer and posthumous propagandist Thomas Clarkson also did a lot to bring Quaker beliefs into the mainstream. "By the 1830s what might be called philo-Quakerism pervaded the intellectual community of the North, especially in New England." (Of course Quakers were only one of many influences on abolitionism.)

Abolitionists—and Transcendentalists—turned away from Locke, with his empiricist psychology and insufficient emphasis on man's will and conscience, embracing more rationalist writers like Price. Theodore Parker remarked that he found much more help in the writings of Kant than in those of Locke, Berkeley, Hume, Reid, and the French materialists. "The Quaker concept of the inner light," Lynd writes, "facilitated the rejection of Locke by offering a homegrown equivalent to the doctrines of Price, Kant, and Coleridge." This aspect of "romanticism" can perhaps be called just as much an extension of the Enlightenment (insofar as the latter was rationalistic) as a reaction against it (insofar as it was empiricist or sensationalist).

What *was* anti-Enlightenment was the worldview of people who, following Jonathan Edwards, thought that man by nature was totally depraved. And there were others who, "with Machiavelli, believed

that in making a new government all men should be considered knaves. Persons holding [these sorts of] opinions were unlikely to believe that human beings should set their own consciences against law and government: were unlikely, in other words, to develop a theory of civil disobedience.” That was left to people like Thoreau and such forerunners as Granville Sharp and William Godwin.

Godwin, basically an early anarchist, was an important link between eighteenth-century Anglo-American radicalism and the civil disobedience of the radical abolitionists. “The basis of Godwin’s system consisted of beliefs ‘common to many branches of Dissenting thought.’ For him as for other radical Dissenters, liberty of conscience ‘secularized and transferred to the civil sphere’ was the theoretical point of departure. His questions were also the questions of Priestley and Price: ‘How may the peculiar and independent operation of each individual in the social state most effectually be preserved? How may the security each man ought to possess, as to his life, and the employment of his faculties according to the dictates of his own understanding, be most certainly defended from invasion?’” He rejected the distinction between free thought and socially regulated action:

It is commonly said, “that positive institutions ought to leave me free in matters of conscience, but may properly interfere with my conduct in civil concerns.” But...what sort of moralist must he be, whose conscience is silent as to what passes in his intercourse with other men?

To quote Lynd, he concluded that “established authority has no more right to regulate an individual’s actions than to regulate his behavior.” Obedience is a question of expediency: decide whether to follow a law by considering the consequences likely to follow from possible courses of action. Ultimately he favored a society without government, in which, with respect to punishment of “criminals,” “local juries would decide each case on its own merits without reference to general laws and without reliance on coercive sanctions.” Government had no legitimate functions, since war was illegitimate and punishment (the other main function of government) usually did more harm than good.

Most abolitionists weren’t quite so radical, but they defended civil disobedience. Some of them advised against paying taxes, others against voting or holding public office—forms of nonviolent resistance. But when the Civil War came, or even before it did, most changed their mind and embraced violent means in the service of a holy end.

The chapter on how these dissenters, both the early ones and the later ones, rejected nationalism and declared “my country is the world” isn’t very interesting, so let’s skip to the last chapter. It begins: “These chapters have described an American intellectual tradition which began with a concept of freedom shared with Rousseau, and culminated in a critique of alienated labor and nationalism shared with Marx. Like Rousseau and Marx, exponents of this American tradition believed that existing society oppressed its members by alienating human powers which nature intended men to reclaim. Like their European counterparts also, twice in the century 1760–1860 they concluded that deliberate lawbreaking and violent resistance to constituted authority were required to put an end to oppression. From all these points of view the ideas we have been considering are properly termed revolutionary.”

Yes, the liberalism/libertarianism of the Enlightenment inspired radicals from Germany, or indeed Russia, to the Americas. And eventually all over the world. In different places and among different classes it took somewhat different forms, had different emphases—sometimes religious and idealistic, sometimes secular and materialistic—but everywhere the tradition shared a resistance to oppression and “alienation,” in Marx’s language. (Of course, these libertarian impulses were far from original to the Enlightenment.)

All these rebels also tended to value *decentralization*. “American radicals in the century preceding the Civil War adhered to an essentially unchanging vision of a decentralized good society... ‘Society in every state is a blessing,’ Paine wrote in the first paragraph of *Common Sense*, ‘but government, even in its best state, is but a necessary evil.’ That government is best, Thoreau concurred at the outset of *Civil Disobedience*, which governs not at all. Like Marx, American revolutionaries sought a society in which the state would wither away.” This seems similar to laissez-faire liberalism, but there’s at least one key difference: these radicals valued *community*—a decentralized network of self-governing communities. A

“cooperative commonwealth,” such as continued to attract workers (the Knights of Labor, etc.) in the late nineteenth century. Which is also to say that, unlike more mainstream liberals of the time, they were not enamored of the market. Their ideal was *democracy*, not the market.

The book ends on a refreshingly materialistic note: “The intellectual origins of the American radical tradition were rooted in men’s effort to make a way of life at once free and communal. What held together these dissenters from the capitalist consensus was more than ideology: it was also the daily practice of libertarian and fraternal attitudes in institutions of their own making. The clubs, the unorthodox congregations, the fledgling trade-unions were the tangible means, in theological language the ‘works,’ by which revolutionaries kept alive their faith that men could live together in a radically different way. In times of crisis resistance turned into revolution; the underground congregation burst forth as a model for the Kingdom of God on earth, and an organ of secular ‘dual power’ [as Trotsky interpreted the soviets]...” During the Revolution, for instance, popular government sprang up in many of the colonies.

*

Amina visited me this week. [I’ve deleted descriptions of our relationship, which ended in marriage and then divorce.]

Well, the next four years are going to be interesting. It’s hard for me not to feel a little *schadenfreude* at the colossal humiliation that was just inflicted on the Clintons and Obamas of the country, the political elite, the horrific mainstream media that is partly responsible for Trump’s election, the whole rotten establishment that has brought this on itself through a generation of neoliberal policies—abandonment of the working class. First Brexit, now this.

But who knows what policies Trump will pursue. His foreign policy might be better in some respects than Clinton’s would have been. Anyway, his election is going to galvanize a ton of left-wing activism, and the Sanders wing of the Democratic party will surely grow. There are silver linings. It’s possible he won’t be *quite* as evil as his campaign rhetoric would make you think.

Ha! From Obama to Trump! Way to go, Obama. Maybe if you’d actually brought some “change,” you wretched mediocrity, this wouldn’t have happened.

The pretty little illusions of the insular, incestuous liberal class—how noble our country is! how wonderful we ruling elite are!—have been exploded. (Doubtless they’ll be reconstituted within weeks, though.)

Read Descartes’ *Discourse on Method*, just for the heck of it. What a verbose and diffuse work! Now a few papers on Wittgenstein. Norman Malcolm, “Wittgenstein on Language and Rules” (1989). Paul K. Moser, “Malcolm on Wittgenstein on Rules” (1991). Paul Boghossian, “The Rule-Following Considerations” (1989). (Brilliant.) Crispin Wright, “What is Wittgenstein’s point in the rule-following discussion?” (2002). And a few others. It seems to me that if there’s any way out of all these conundrums about meaning and rule-following, it has to lie in the cognitivist approach: we *do* follow rules, but most of the rules are constituted unconsciously. Generally speaking, they’re not accessible to consciousness.

Stanislas Dehaene, *Consciousness and the Brain: Deciphering How the Brain Codes Our Thoughts* (2014). Good book, sophisticated but readable. Explores how much of the brain’s activity is unconscious. For instance, after reviewing a bunch of experiments, Dehaene states what should have been obvious all along (although of course it did need to be experimentally confirmed): “in some respects, consciousness is irrelevant to semantics—our brain sometimes performs the same exact operations, all the way up to the meaning level, whether or not we are aware of [the words we have been exposed to, e.g. because they were flashed on a computer screen too briefly for us to consciously notice them].” The brain can unconsciously process word meanings, just as it can unconsciously process the emotional valences of images, etc.

Dehaene also summarizes experiments that show that consciousness definitely isn’t epiphenomenal. Which is to say, there are a hell of a lot of things we couldn’t do if we weren’t conscious. Duh. One of consciousness’s evolutionary roles, for instance, is “learning over time, rather than simply

living in the instant.” Subliminal perceptions and thoughts can’t be retained for longer than a second or so, whereas conscious ones can. Another function may be to simplify and focus perception (since our brain is constantly receiving an enormous amount of sensory information). Also, we need consciousness in order to rationally think through a problem. The unconscious mind doesn’t seem able, by itself, to carry out *steps* of reasoning; it can carry out single operations but not a cumulative series of them. And of course social information sharing is likely another essential function of consciousness.

Interesting discussion of “the signatures of a conscious thought.” I’ll just quote a particularly easy-to-read thing that I find pretty incredible, and also eerie: “With intracranial electrodes, the effects of stimulation can be very specific. Sparking off an electrode atop the face region of the ventral visual cortex can immediately induce the subjective perception of a face. Moving the stimulation forward into the anterior temporal lobe can awaken complex memories drawn from the patient’s past experience. One patient smelled burnt toast. Another saw and heard a full orchestra playing, with all its instruments. [!] Others experienced even more complex and dramatically vivid dreamlike states: they saw themselves giving birth, lived through a horror movie, or were projected back into a Proustian episode of their childhood. [Apparently] our cortical microcircuits contain a dormant record of the major and minor events of our lives, ready to be awakened by brain stimulation.” If you stimulate the subthalamic nucleus, the result is a state of depression, “complete with crying and sobbing, monotone voice, miserable body posture, and glum thoughts.”

Astounding. Not surprising, but astounding nonetheless. It’s obvious but incredible anyway that the Ninth Symphony is in my head, encoded in neurons, and theoretically can be elicited by the right stimulation.

In any case, “putting together all the evidence inescapably leads us to a reductionist conclusion. All our conscious experiences...result from a similar source: the activity of massive cerebral circuits that have reproducible neuronal signatures. During conscious perception, groups of neurons begin to fire in a coordinated manner, first in local specialized regions, then in the vast expanses of our cortex. Ultimately, they invade much of the prefrontal and parietal lobes, while remaining tightly synchronized with earlier sensory regions. It is at this point, where a coherent brain web suddenly ignites, that conscious awareness seems to be established.”

But what *is* consciousness? Here’s Dehaene’s answer:

When we say that we are aware of a certain piece of information, what we mean is just this: the information has entered into a specific storage area that makes it available to the rest of the brain. Among the millions of mental representations that constantly crisscross our brains in an unconscious manner, one is selected because of its relevance to our present goals. Consciousness makes it globally available to all our high-level decision systems. We possess a mental router, an evolved architecture for extracting relevant information and dispatching it. The psychologist Bernard Baars calls it a “global workspace”: an internal system, detached from the outside world, that allows us to freely entertain our private mental images and to spread them across the mind’s vast array of specialized processors [e.g., language, memory, the motor system, etc.].

So according to this theory, consciousness is just “brain-wide information sharing.” He goes on to suggest that this was likely an evolutionary adaptation: in the harsh natural environment, it was necessary to have a mental map of space, a visual recognition of landmarks, a recall of past successes or failures at finding water or food, and so on. “Long-term decisions of such a vital nature, leading the animal through an exhausting journey under the African sun [for example], must make use of all existing sources of data. Consciousness may have evolved, eons ago, in order to flexibly tap into all the sources of knowledge that might be relevant to our current needs.”

C. L. R. James' classic *The Black Jacobins: Toussaint L'Ouverture and the San Domingo Revolution* (1938/63). Should have read it long ago: it's beautifully written and analytically profound. If James' portrait is at all accurate, Toussaint L'Ouverture was an astonishing human being and one of the greatest revolutionary leaders in history. The black Spartacus, except he succeeded where Spartacus failed. Far greater than Lenin and Trotsky in his humanity and his commitment to authentically revolutionary values, his singleminded commitment to the noblest values of the Enlightenment. In a sense, the Haitian Revolution was the consummation of the Enlightenment, more so than the French. And it was largely Toussaint's doing. (Of course, it wouldn't have been possible without the French Revolution.)

—Except, as James says, his genius failed him at the end. And to some extent before the end. He ought to have proclaimed to the heavens his solidarity with the black masses, and made it even more visible in his policies, which were too favorable to whites.

And his submission at the very end...his two submissions...what the hell happened to him?? How such a brilliant leader suddenly could have become so misguided, even more misguided than when he shot Moïse, is a mystery. Such a stubborn will to maintain some connection with France, such a reluctance to cut all ties and destroy the French army on the island even when it was obvious that Napoleon was determined to restore slavery, such weakness as he displayed...it really is hard to understand, despite James' explanations.

My god, the savagery of the French. Or rather, of imperialists. They weren't and aren't human.

Now Charles Bergquist, *Labor and the Course of American Democracy: US History in Latin American Perspective* (1996). Argues, among other things, that U.S. labor historians should do more to examine the connections between imperialism and labor history since the late nineteenth century. For instance, U.S. imperialism has supposedly, to a great extent, been an elite response to domestic social unrest. (This may be true in some periods—perhaps the end of the nineteenth century, as Walter LaFeber argues—but it isn't true in others. George W. Bush's Iraq war, for example, didn't mollify social unrest but fostered it.)

Read J. S. Mill's essay "A Few Words on Non-Intervention." A hilariously naïve and embarrassingly tribalist exercise in British apologetics for imperialism. We Brits are almost impossibly magnificent, we never act from selfish motives, it's our duty to civilize the barbarians, etc. Typical liberal idealism. What a pygmy Mill was compared to Marx.

Back to common sense: Woody Holton, *Unruly Americans and the Origins of the Constitution* (2007). An economic interpretation. From the dust jacket: "the primary purpose of the Constitution was, simply put, to make America more attractive to investors. And the linchpin to that endeavor was taking power away from the states and ultimately away from the people." The 1780s were chock full of economic turbulence and class conflict, especially between debtors and taxpayers on the one hand and creditors and bondholders on the other. An incredibly unstable time, thought of as far too democratic by the elite and not nearly democratic enough by the populace. Large and small popular rebellions all over the place; continual resistance to excessive taxes intended to pay off governments' huge war debts. "One reason the Founding Fathers favored the Constitution was that it would, for the first time, give the federal government the funds it needed to field an army capable of suppressing farmers' rebellions. That is what the Framers were talking about when they stated in the preamble to the Constitution that one of their goals was 'to ensure domestic tranquility.'"

"But the agrarian insurrections of the 1780s actually influenced the adoption of the Constitution even more powerfully in an indirect way. Insurgents extorted substantial tax and debt relief from reluctant state legislatures, and overturning this legislation became one of the principal reasons the Constitution was written..."

This book makes it clear that the Founders hated democracy with the white-hot intensity of a thousand suns. Even Jefferson was at best ambivalent towards it. To a first approximation, the Constitution can be considered just an elaborate instrument to limit democracy. The main reason it wasn't even more antidemocratic was that "it was necessary to consider what the people would approve," to quote one delegate to the Constitutional Convention. Ideally, the delegates would have loved to enact Hamilton's

proposal for a presidency-for-life and Senate-for-life, but they knew that was hopeless. The populace wouldn't have approved it.

“Modern descriptions of the Constitutional Convention generally focus upon the series of ‘great compromises’ that towered, like a chain of mountain peaks, over the members’ day-to-day toil on more mundane matters. And yet twenty-first-century Americans are rarely exposed to what was arguably the greatest compromise of all: numerous explicitly elitist proposals, each of which would have obtained majority support if the delegates had had free rein, had to be abandoned—or at least replaced with more subtle devices—because they jeopardized ratification. These were compromises between the Framers and the American people. The convention nonetheless managed to construct a new national government that was considerably less democratic than even the most conservative of the state constitutions.”

An unusual alignment of class interests occurred around federal taxation. The elite wanted to end the agrarian uprisings and relief legislation, and get creditors and bondholders paid; the masses wanted lower taxes. Well, giving the federal government power to impose tariffs on imported goods would accomplish all these goals, since, as a lucrative source of income, tariffs would eliminate the need for states to levy high direct taxes while simultaneously giving government enough money to pay its creditors. The prospect of lower taxes led many Americans to support the Constitution despite its antidemocratic and anti-debtor provisions. (Article 1, Section 10 was particularly anti-debtor, since it prohibited relief legislation.)

Another reason for the states’ ratification of the Constitution was that the standing army it would establish would be invaluable against Indians, the British, and slave revolts.

But probably most important in convincing the skeptics was Federalists’ promise that they would write a bill of rights after ratification. “It is a remarkable but rarely noted irony that Americans owe their most cherished rights—among them freedom of speech and religion, the right to trial by jury, and protection against self-incrimination and illegal search and seizure—not to the authors of the Constitution but to its inveterate enemies,” who insisted on these amendments.

Now Terry Bouton, *Taming Democracy: “The People,” the Founders, and the Troubled Ending of the American Revolution* (2007). Very good book. The famous financier Robert Morris emerges as one of the villains of American history, a wretched, greedy, merciless, bungling villain—different from nearly all the rich only in his power and even greater wealth than most.

One of the “advantages” of the Trump presidency is that it will only accelerate what was bound to happen eventually, the partial disintegration of society and the radicalization of millions. [...]

For some reason I’m particularly upset by the environmental damage that Trump and the Republicans will cause. I’m not sure why. Maybe because that seems most permanent? And because it might have consequences for the entire species? I’m also worried that sometime in the future nuclear war will break out. When the world is run by lunatics and sociopaths, anything is possible.

On a personal level, it bothers me that *intellectually stimulating* things like philosophy will seem even more frivolous than they have for a generation. Writing about history and politics is kind of boring, and not very creative. I’d like to just retreat into a cave and write about intellectual problems—but I can’t, because I’ll feel like I’m being totally irrelevant and frivolous.

Had the dissertation defense today. It went okay. The committee members were both appreciative and critical (rightly so). Anyway, I passed, so in effect I’m now Dr. Wright. A nice little status-boost. I honestly wasn’t sure I could pull off this dissertation thing, but those three magical letters are very motivating. 550 pages in all (not including the long bibliography).

So my graduate school experience is basically done. Eleven years. A new phase of life is about to start.

Reading Jean Jaurès’s classic *A Socialist History of the French Revolution*—an abridged version.

Published a couple of articles on several left-wing websites:

The Founding Fathers: “Neoliberals” *Avant le Mot*

“Who is to blame for the election of Donald Trump?” It’s a question that has been asked more than a few times since November 8. We’re all familiar with the answers that have been given: James Comey, the electoral college, the DNC’s *leaked*—not hacked—emails, the characteristically shameful performance of the mainstream media in its focus on personalities rather than substance, the stupefying incompetence of Hillary Clinton’s campaign, the elitist insularity and corruption of the Democratic Party, etc. Longer-term causes (which are intertwined) include the decline of organized labor, which has always served as a bulwark against fascism or semi-fascism; deindustrialization, which has contributed to the economic insecurity that apparently *motivated* many of Trump’s supporters; and the almost total capture of the Democratic Party by the corporate sector of the economy. But one group of people has tended to escape blame, even despite widespread disgust with the electoral college: the U.S.’s “Founding Fathers.” While they are distant in time from the political obscenity that was November 8, they are far from innocent.

This is clear from two books that every American should read, published in 2008 and 2009 respectively: Woody Holton’s *Unruly Americans and the Origins of the Constitution* and Terry Bouton’s *Taming Democracy: “The People,” the Founders, and the Troubled Ending of the American Revolution*. These books reveal the extent to which nearly all the Founders loathed and feared democracy, at least between the 1780s and the first decade of the nineteenth century. (Their attitudes were more complex in the 1770s, and in their later years such (former) anti-democrats as James Madison and John Adams were repulsed by the excesses of the capitalist aristocracy.) The popular attitude of reverence for the Founders is a product of deep misunderstanding and ignorance, for it is the viciously antidemocratic structure of the political system the Founders created that has helped make possible our new Gilded Age, and thus the political success of someone like Donald Trump.

In fact, I think it’s important to spread the idea that, far from being “liberators,” the Founders were, in essence, the first in America’s long line of usurpers and oppressors. This idea is a simplification, but it contains a large kernel of truth. The hackneyed narrative that history textbooks still teach about the greatness and nobility of Washington, Madison, Adams, Hamilton, and the others is nothing but nationalist propaganda that serves to obscure the *malignity* of these people’s historical impact and legacy. One might even say that their most potent legacy was the precise opposite of what we’ve been trained to think (and what they thought): rather than having been great figures of anti-authoritarian revolution, heroic fighters against tyranny, in effect they did much to clear the ground for the most rapacious tyranny in history, the national and eventually global tyranny of capital.

The 1780s: the Founders vs. the People

These judgments might seem excessively harsh, but consider the facts. Across the American colonies, the revolutionary 1770s were a time of relative democracy. In the struggle against the British, the gentry and the lower classes to some extent united around the banner of white male popular empowerment. States adopted strikingly democratic constitutions, none more impressive than Pennsylvania’s in 1776, which established a unicameral legislature, annual elections for every representative, a weak governorship that could not veto laws the legislature passed, the *election* rather than *appointment* of most offices in the state and county governments, and the enfranchisement of nearly all adult men, even those who owned no property.

But things changed in the 1780s. The gentry had “tired of an excess of democracy,” to quote Alexander Hamilton—others were less restrained, decrying “democratical tyranny,” a “republican frenzy,” a “prevailing rage of excessive democracy”—and tried to take total control of state governments. Given the shortage of gold and silver, during the war with Britain governments had issued paper money, which soon led to high inflation. This was blamed, simplistically, on the democratic character of the governments, the “imbecility” of popularly elected politicians; and most of the elite “gentlemen” came to view all government-issued paper money as an evil to be done away with. They also disliked the social and cultural manifestations of democracy, the leveling spirit that raised commoners in their own eyes and lowered the

gentry. The ultra-rich financier Robert Morris represented his class when he resolved to strip power from all these “vulgar Souls whose narrow Optics can see but the little Circle of selfish Concerns.”

The political and economic agenda that Morris and his associates championed bore a remarkable, if hardly surprising, resemblance to neoliberalism. “Morris wanted government to channel money to the wealthy,” Terry Bouton writes, “either through direct payouts or by privatizing the most lucrative parts of the state and turning them over to new for-profit corporations owned and run by the gentry.” One of the most powerful figures in American history, Morris founded in 1781 the first private bank in the United States—the Bank of North America—in part to remove finance from democratic control: not governments, but banks would issue paper money. Private corporations, unlike governments, would be immune to public pressure for a greater supply of money, and would therefore be able to prevent inflation. Actually, the acute shortage of money during the 1780s showed that Morris was too pessimistic: even in states where legislatures did on occasion print money, they certainly did not do so to the extent that “the people” desired.

The 1780s were a time of ferocious class conflict, with most of the eventual framers of the U.S. Constitution facing off, alongside Robert Morris and the majority of the gentry, against the middling and lower classes, overwhelmingly agrarian. On one side were the wealthy speculators in government IOUs, who had bought these bonds for pennies on the dollar from the farmers, artisans, and soldiers to whom they had been given during the war as payment for goods and services. Their original holders, expecting the bonds to depreciate and needing money right away, sold them for whatever they could get. Speculators, on the other hand, could afford to wait years for the government to redeem the bonds, and had the political clout to insist that they be paid at or near the certificates’ full face value even though at the time of issuance the certificates’ *market* value was far below this. The state and federal war debt most of which speculators thus bought up was enormous, about \$27 million.

To pay interest on the war debt, many states tended to impose the same type of fiscal and monetary regime on the populace that more recently the IMF has favored: oppressive taxes, a tight money supply, and the curtailing of public services (such as government-run “loan offices” that gave cheap credit to farmers and artisans). Since both private creditors and bond speculators were averse to paper money, governments compelled debtors and taxpayers to pay with gold and silver. But the war years had drained the country of gold and silver, making it impossible for people to pay. The nationwide tragedy that resulted has been compared to the [Great Depression](#) of the 1930s: tsunamis of property foreclosures swept up hundreds of thousands of families, and economic activity plummeted. “Public Trade and Private transactions of Human Life,” petitioners in Pennsylvania protested, “[are] nearly reduced to a total Stagnation.”

On the other side of the economic divide, then, were masses of ordinary people who found that their troubles were much worse in the 1780s than they had been in the last years of British rule, when their hardships had driven them to rebellion and war. “Have we not expended our blood and our treasure to expel from the land a set of invaders who sought to rule over us as taskmasters,” they exclaimed in the mid-1780s, “and shall we now become bondsmen to people of our own country?” The irony was appalling, and the victims fought back.

In fact, they were able to extract significant concessions and relief measures. In some states, by electing legislators sympathetic to their plight, farmers and artisans benefited from temporary suspensions of tax collection. Violent resistance, such as Shays’ Rebellion in Massachusetts in 1786 and ’87, frightened governments into being more lenient in their fiscal and monetary policies. Local and county officials often were sympathetic to the suffering of their neighbors and refused to enforce the law or carry out orders: for example, county tax officers would delay collection; some sheriffs obstructed or prevented property foreclosures; justices of the peace refused to prosecute people for nonpayment of taxes. Nor were state militias always of use in enforcing tax collection, for it was frequently militiamen who were leading the anti-tax protests. All this protest in the mid-1780s substantially mitigated the hardships of “the 99 percent” (so to speak)—which means that it was a tremendous irritant to the elite. For one thing, it prevented bondholders and creditors from being paid as much and as regularly as they wanted. For another, it fostered economic and political uncertainty, which made for a bad investment climate. European investors, in

particular, were leery of sending their capital to a land that was so riven by conflict. How could a country develop if it couldn't attract investment?

Various solutions were possible to the political and economic instabilities of the 1780s, and spokesmen of the aggrieved masses made reasonable proposals that were relatively fair to both sides of the class struggle. They called for a revaluation of war debt certificates, progressive taxation, limits on land speculation, bans on for-profit corporations, and other measures that would alleviate spiraling wealth inequality and strengthen democracy. Such proposals were consistent with the popular understanding of republicanism, an understanding that differed from that of aristocrats like Madison, Washington, Adams, Hamilton, and Edmund Randolph. As Gordon Wood describes in [The Radicalism of the American Revolution](#), these latter men considered it axiomatic that, because only an elite of disinterested, virtuous, propertied gentlemen was capable of pursuing the *public* good over selfish private ends, the success of a republic required that such men hold power. It was necessary to tame the wildness of democracy—i.e., to effectively disenfranchise the majority—in order for enlightened civic virtue to flourish.

“The people,” on the other hand, tended to have a less naïve view of the world. As yeomen from Pennsylvania said in one of their many petitions to the state government, “No observation is better supported, than this that, a country cannot long preserve its liberty, where a great inequality of property takes place.” Some of their legislators agreed: they declared that for-profit corporations were “totally destructive of that equality which ought to prevail in a republic.” Farmers wrote that “We observe, with great anxiety, wealthy incorporated companies taking possession of public and private property,” and condemned processes that made “a few men...sufficiently powerful by privileges and wealth, to purchase, or to destroy, the property and rights of their fellow citizens.” Evidently these farmers had a more sophisticated political understanding than James Madison and his idealistic colleagues did, at least insofar as they understood that the real danger to republicanism was not democracy but rather a sharp inequality of property.

The Constitution: Triumph of Reaction

Needless to say, it was not the farmers' democratic vision that ultimately prevailed. Robert Morris and other anti-democrats across the states organized a new Constitutional Convention in 1787 to remedy the defects of the Articles of Confederation, which is to say to write a new Constitution that would more adequately insulate government from democratic control. The convention was not sold this way to the people, of course; its purpose, instead, was supposed to be to find ways to give government more power to protect shipping and to negotiate trade deals with foreign nations. Secretly, though, nearly all the delegates had one goal mainly in mind: to make America more attractive to investment, as Woody Holton argues. “And the linchpin to that endeavor,” he says, “was taking power away from the states and away from the people.”

In other words, the U.S. was founded from the motive, and on the principle, of *servicing capital*. The very structure of its political system was chosen so as, chiefly, to attract investors, i.e., to be a tool of capital accumulation. It is probably the only country in history of which this is the case. But to those who are familiar with U.S. history, so full of [subservience to capitalism](#), such a revelation should not be surprising.

Many of the devices that the Constitution's framers proposed to limit democracy were not adopted at the convention in Philadelphia. The delegates had to navigate between two contradictory imperatives: on one hand, they wanted to make it forever impossible for states to adopt the kinds of debtor-relief and taxpayer-relief legislation that the 1780s had seen; on the other hand, they could not make the Constitution *so* antidemocratic that the states and the people would not ratify it. Because of this second consideration, for example, Madison's proposal that the U.S. Senate be able to veto state legislation “*in all cases whatsoever*” was rejected. The same fate befell Hamilton's extreme proposal that the Senate and President be elected *for life*, as a way to provide the government with maximum protection against democracy. Nearly all the delegates strongly favored Hamilton's plan, but they knew it would prevent the Constitution from being ratified.

Nevertheless, in its finished form the Constitution was hardly a model of democracy. While senators' terms were not nine years long, as Madison wanted, six years was long enough to considerably insulate the Senate from the popular will. The Senate's very existence, of course—as a body explicitly reminiscent of Britain's House of Lords—was a significant “check and balance” against the people. As was the indirect election of its members, and of the president (by means of the electoral college). The Constitution's framers even managed to limit democracy in the House of Representatives, by making election districts so large that ordinary people would have a hard time getting elected. Men of wealth would be much more successful than others in making their names and views known in a large district. To say it differently, large districts would “divide the community,” as Madison said, and make it difficult for the non-wealthy to “unite in the pursuit [of a] common interest.”

Furthermore, members of the House and the Senate could not be recalled, and constituents were not given the right to instruct their representatives on how to vote on particular issues (a right that even as British colonists many of them had had).

As for the presidency, it would be a very powerful position that could veto any dangerously democratic law that somehow made it through the gauntlet of the deliberately cumbersome and convoluted machinery for passing legislation in Congress. The president would also be responsible for making most major appointments in the national government, a power that under the Articles of Confederation had resided in the legislative branch.

The Supreme Court—appointed, not directly elected—had its part to play in “check[ing] the imprudence of democracy” (to quote Hamilton): through judicial review it could overturn both federal and state legislation. In this way, Madison's proposal that the national government have some means of vetoing inconveniently democratic state laws was salvaged.

In case such protections were not enough, language was written into the Constitution that expressly forbade most of the pro-debtor, pro-taxpayer laws states had passed in the 1780s. Article I deprived states of control over the war debt, thus preventing them from paying war debt speculators the market worth rather than the much higher face value of the certificates they held. (As Secretary of the Treasury, Hamilton, who had been mentored by the ultra-conservative Robert Morris, gave these speculators a tremendous windfall, to the outrage of farmers.) Congress was granted the power to directly tax citizens instead of relying on states to do so, and it could break mass resistance to tax policies by bringing in militias from surrounding states. Section 10 of Article I was especially momentous: it reads, in part, “No State shall...emit Bills of Credit; make any Thing but gold and silver Coin a Tender in Payment of Debts [nor] pass any...Law impairing the Obligation of Contracts.” In one swoop, this established a political-economic regime that overwhelmingly favored creditors. It prohibited states from issuing their own paper currency—“effectively destroying state-run land banks [i.e., loan offices],” as Bouton notes, “and the system of public, long-term, low-cost credit” that had been very effective and enormously popular with farmers. Debt arbitration was outlawed. In general, states were prohibited from rescuing debtors.

(It is worth noting, parenthetically, that the recent fashions of “originalism,” “original intent,” “strict constructionism,” and such tendencies in legal interpretation of the Constitution are predictable in a neoliberal context, given that the framers and their contemporaries thought of the now-revered document as thoroughly antidemocratic. Originalism can be a useful tool of hyper-capitalism.)

The majority of ordinary citizens were none too fond of this radically elitist Constitution. But they were so scattered and had so few resources compared to the “Federalists” who supported it that it was difficult for them to mount an effective opposition. Federalists, moreover, did not play nice. They were prepared to go to almost any length to get the Constitution ratified. In some states, such as Pennsylvania, they organized a ratification convention before the opposition had a chance to mobilize, and they gave districts that favored ratification a disproportionately large number of delegates. Their ownership of most newspapers allowed them to conduct a major propaganda campaign that suppressed the voices of Anti-Federalists. Violent threats were made against Anti-Federalist printers; offending pamphlets and newspapers were “stopped & destroyed”; Federalist postmasters intercepted and suppressed Anti-Federalist mail; writers resorted to lies about the provisions that the Constitution contained and the process that had brought it into being.

On the other hand, many people were reconciled to it on the basis of legitimate considerations. For one thing, since the national government would have the power to impose tariffs on imports, most people's taxes would likely be reduced. The government could rely primarily on tariffs for its revenue, not direct taxation of citizens (as had been the case in the 1780s). Even more importantly, Federalists committed to adding a Bill of Rights to the Constitution after it was ratified. This was something that middling citizens from across the country insisted on. Woody Holton makes an apt observation on this point: "It is a remarkable but rarely noted irony," he says, "that Americans owe their most cherished rights—among them freedom of speech and religion, the right to trial by jury, and protection against self-incrimination and illegal search and seizure—not to the authors of the Constitution but to its inveterate enemies." The Bill of Rights was a concession to the rabble.

If the farmers of the 1780s were alive today, however, they might feel vindicated. This isn't the place to review the entire history of the U.S.'s capitalism-on-steroids, but it should hardly be controversial to say that the antidemocratic, anti-"working class" political framework the Founders put in place has been perfectly adapted to the ambitions of a predatory economic system. It is almost as if capitalism had reached back from the future to move its pawns like chess pieces against capital's early opponents, who were finally checkmated when the Constitution was, through fair means and foul, ratified. After that, it could be smoother sailing for a developing American capitalism—although even then its development had to [continually confront mass resistance](#). Eventually, and always with the [decisive aid](#) of the peculiar structure of the American polity, a point was reached where wealth could be so concentrated, the political system could be so captured by the corporate oligarchy, and ordinary people could be so desperate for change that they would elect a monstrosity like Donald Trump.

So here we are in 2017 still burdened with political leaders who, like the Constitution's framers, are concerned above all to protect creditors, financiers, and investors; who have the same "wisdom" as most of the Founders in their desire to undermine democracy, whether through gerrymandering, major propaganda campaigns, arcane Congressional tricks of obstructing popular legislation, or simply the appointment of wealthy friends to important government posts. The growing democratic resistance is in the tradition not of the "great men" who wrote the Constitution but of their enemies.

*

Communism and Human Nature

In a world becoming more atomized and misanthropic by the day, where it seems sometimes that you have only to be a raving degenerate in order to achieve fame and power—witness Donald Trump and Steve Bannon, or, in a different way, Milo Yiannopoulos (whose degeneracy, though, has partly caught up with him)—it is useful to be reminded of the other side of human nature. The institutions of modern capitalism happen to reward depravity, first and foremost in the economic sphere, but since the maturation of mass society generations ago in the cultural sphere as well. One is constantly confronted, therefore, by moral and intellectual filth—the depths of human vulgarity on television and the internet, mad lusts for power and profit in politics and business, collective slavishness to mainstream norms in intellectual institutions, self-deception on a virtually heroic scale among the hordes of *objective* servants of power. One feels hemmed in by forces of delayed social implosion; one feels claustrophobic in a society whose categorical imperatives are but to privatize and marketize, to impersonalize, bureaucratize, and stupidize, all for the sake, ultimately, of accumulating capital.

Fortunately there are avenues of momentary escape from the decadence. One such avenue is to follow a particular train of thought that David Graeber pursues in his bestselling *Debt: The First 5000 Years*, as well as in [this paper](#). It provides a conceptual antidote to the knowledge that Trumps and Bannons exist.

Namely, Graeber reminds us that fundamental to human nature, more fundamental than the debaucheries thrown up by late capitalism, is the tendency that he dubs *communism*. On a deep level, we are all (or nearly all), to some degree, communists. For if communism means "from each according to his

ability, to each according to his need,” as Marx defined it, then it simply means sharing, helping, and cooperating—giving to others in need what you’re able to give them, even if it is only advice, assistance at some task, sympathy or emotional support, or some money to tide them over. Friends, coworkers, relatives, lovers, even total strangers constantly act in this way. In this sense, Graeber says, “*communism is the foundation of all human sociability*”; it can be considered “the raw material of sociality, a recognition of our ultimate interdependence that is the ultimate substance of social peace.”

From this perspective, incidentally, the early Marx’s apotheosis of communism in the *Economic and Philosophic Manuscripts of 1844* acquires a somewhat different meaning. To quote his grandiose idealistic [formulation](#): “This communism, as fully developed naturalism, equals humanism, and as fully developed humanism equals naturalism; it is the *genuine* resolution of the conflict between man and nature and between man and man—the true resolution of the strife between existence and essence, between objectification and self-confirmation, between freedom and necessity, between the individual and the species.” If one understands “communism” in Graeber’s sense, as, in effect, a fundamental tendency of human nature—and a “principle immanent in everyday life,” to quote Graeber—these exalted theses are at least suggestive. For instance, humans’ psychological communism does tend to resolve conflicts between man and nature and between man and man, for it springs from the reservoir of *sympathy* that Enlightenment thinkers such as Adam Smith understood to be shared by all non-pathological humans.

The communist morality, in fact, is nothing but a corollary of the Golden Rule, that you should treat people as you’d like to be treated, with respect and compassion. Morally speaking, communism is common sense. Indeed, polls show that, despite what we’re taught to think about the political proclivities of Americans, large numbers agree with this “radical” statement. In 1987, for example, when Reaganism was ascendant, a national poll [found](#) that 45 percent of Americans considered Marx’s famous slogan quoted above (from his *Critique of the Gotha Program*) to be so obvious that they thought it was enshrined in the U.S. Constitution! This is a point one might make in debates with political “conservatives” (i.e., reactionaries).

It would be amusing, too, to point out to some Breitbart writer or his legions of online followers that, in spite of himself, he is manifesting a communist morality every time he helps someone, every time he shares or cooperates; he is acting contrary to the capitalist imperative to “[gain wealth, forgetting all but self](#).” Or to point out to a conservative Christian that “Christian love” is [essentially communistic](#), and that Jesus hated the wealthy. (See, e.g., Luke 6:24-25: “But woe unto you that are rich! for ye have received your consolation. Woe unto you that are full! for ye shall hunger. Woe unto you that laugh now! for ye shall mourn and weep.”) A communist *society* would just be a society in which the “baseline communism” of everyday life (and of original Christianity) was the guiding rule, the main principle of social organization.

As for our own society, the only reason it is able to function at all is that it’s held together by this dense anti-capitalist fabric, into which the more superficial patterns of commercialism, the profit motive, and greed are woven. Capitalism is parasitic on everyday communism: everything would collapse if the latter even momentarily vanished. One might, therefore, reverse the typical judgment of apologists for the status quo: not only is capitalism not a straightforward expression of human nature (supposedly because we’re all predominantly greedy, as an Ayn Rand or a Milton Friedman might say); it is more like a perversion of human nature, which evidently is drawn to such things as compassion, love, community, respect for others, and free self-expression unimpeded by authoritarian rules in the economic or political sphere.

—Such are the thoughts with which I try to comfort myself periodically, when feeling overwhelmed by the systemic misanthropy that daily bombards us all.

I feel my creative powers waning. When was the last time I had enthusiasm? Perhaps when writing my third book. I no longer have a brilliant mind; I no longer get much pleasure from writing. I wanted to be great, but I grow ever more aware of my limitations. My feeble memory, my decaying talent for writing, my lack of interest in ideas, life, and the world. My doubts that I’ll be a good teacher. Even designing a

syllabus is too hard for me. Now that my Ph.D. is done (except for the official graduation), I don't know what to do. I sit around and do virtually nothing creative. Don't know where to direct my energies, what few energies I still have.

Reading Jonathan Israel's *A Revolution of the Mind: Radical Enlightenment and the Intellectual Origins of Modern Democracy* (2010). Very useful.

Now Sven Beckert's *Empire of Cotton: A Global History* (2014). Monumental.

Now E. H. Carr's *What Is History?* (1961).

Published another article, based on my cooperatives book. Also got my old *Book of Joe* satire published in a literary magazine and online.

Took some notes on George Novack's *Empiricism and Its Evolution: A Marxist View* (1968), to post them online:

...Starts out by noting that "empiricism" has a twofold meaning: empirical habits of thought and investigation (scientific investigation), and the empiricist philosophy of Locke and his successors. The latter wasn't totally original. "Some earlier philosophers had taught that human knowledge must be based on sense experience. Among the Greeks, thinkers who were otherwise so unlike as Democritus and Aristotle assigned the primary role in the process of knowledge to sense experience. Even such eminent schoolmen as Thomas Aquinas and Albert the Great aspired to develop their science of nature through a rational interpretation of sense experience rather than on Christian revelation." Novack continues: "However, except for the Atomists, these ancient and medieval schools did not make the origin of knowledge in sense experience the governing principle which was central to their whole system of thought. That was the epoch-making innovation of Locke and his successors."

Both empiricism and the modern science on which it was based and from which it took inspiration were essentially progressive forces, intimately connected to and caused by "the bourgeois transformation of Western society." For instance, empiricism helped destroy the obsolete categories of scholastic thought (feudal thought, Catholic thought), thus helping to accomplish in the realm of theory and ideology what capitalism was accomplishing in the realm of the economy and politics, namely the overcoming of the old regime and liberating of the potential of human knowledge, technology, productivity, and sheer individuality. This whole *empirical* way of thought and behavior, which in its skeptical and inquisitive essence was intrinsically opposed to old authorities and shibboleths, became the spirit of the Enlightenment—which was the spirit of freedom, reason, criticism, science, universality, rebellion. In this sense empiricism, emerging organically out of the growing capitalist economy and its scientific and technological offshoots, was an absolutely essential world-historical force.

But I'd say that the anti-innatist, anti-rationalist doctrines of this tendency of thought—that the mind/brain doesn't bring very much to experience but is somewhat passive and easily moldable—(notions that are radically false) gradually became anti-progressive and useful to authoritarianism later on, in the twentieth century. As Chomsky says, "If in fact man is an indefinitely malleable, completely plastic being [as empiricism holds him to be], with no innate structures of mind and no intrinsic needs of a cultural or social character, then he is a fit subject for the 'shaping of behavior' by the state authority, the corporate manager, the technocrat, or the central committee." So, while empiricism originally became dominant as a tool of the struggle against reactionary old authorities such as the Church, it has persisted, in various forms (e.g., behaviorism), among intellectual and political circles perhaps in part because it became *useful to state-capitalist* authorities, whether in the Soviet Union or in the U.S.

In any case, Novack is right that "since the seventeenth century, empiricism, in one form or another, has been the major philosophy of the English-speaking peoples on both sides of the Atlantic." Evidently it is the preferred philosophy—or one aspect of the preferred philosophy—of capitalism. As Novack goes on to say, "From Bacon to Hume, it acted as a powerful stimulant to progress in Western thought. It challenged medieval ideas, shattered scholasticism, dislodged many props of feudal theology, and undercut established modes of idealism. It sought to devise a new logic and a more fruitful method of investigation of natural phenomena, of society, and of the reasoning processes to replace the formalized logic and sterile

speculations of the scholastics. It aided the revival of materialism and helped clear the ground for the growth of the natural and social sciences.”

Francis Bacon “may be regarded as the father of British materialism and the grandfather of empiricism.” For one thing, he severed natural philosophy from religion, by arguing that humans could know God’s nature only through revelation, not reason or sensation. So science was allocated its own autonomous territory, “in which it could expand more freely.” Ultimately this separation of science and philosophy from theology undermined the theological foundations of religious dogmas, “and so cleared a path for materialist and even directly atheist conclusions.”

Bacon’s experimentalism, inductivism (as opposed to scholastic deductivism), and materialism—matter was “indestructible, self-moving, ever active, and constantly changing,” and not interfered with by God (who had created the universe but then left it to its own devices)—inspired later developments. He conceived the main function of philosophy not as providing arguments for religious dogmas but as serving the practical needs of mankind. As for empiricism:

For Bacon, experience, based upon what we learn through the senses and aids to the senses like the telescope, was the sole valid source and sure road to useful knowledge. Unlike most of his empirical successors, he did not interpret sensuous experience as primarily passive. He was one of the first to emphasize that the acquisition of knowledge had its active side in the manipulating and shaping of objects as is done by a craftsman. It is through such practical activity that the senses disclose the essential features of nature to us.

Later on, “the materialism he pioneered acquired an aristocratic and monarchist form in the hands of his companion Thomas Hobbes and a plebeian and democratic expression in the Leveller leader, Richard Overton (1597–1663).”

Novack’s discussion of Locke is inadequate, but he does make a few suggestive remarks. In particular, he traces Locke’s general tendency to stake out a *middle* position to his role as an ideologist for the British bourgeoisie. For example, “the victorious bourgeoisie [after the Glorious Revolution] needed institutions of the Christian faith to uphold their regime, just as they had to foster natural science to promote their material interests. But they could not maintain the same sort of religion as the absolute monarchy. They sought a religion tailored to their special requirements, a utilitarian Protestantism which blessed the union of Church and State, tolerated a certain degree of nonconformism, and reconciled the new findings of physical science with the religious viewpoint.” Locke was their spokesman. In *The Reasonableness of Christianity* he discarded some objectionable doctrines, such as the Trinity, and retained others. He argued for religious toleration—except for Catholics and atheists (threats to the bourgeoisie from opposing sides). Like Boyle and Newton, he defended the idea of God as the efficient cause of the universe—which proved an unstable compromise between religion and science, a compromise that opened up the possibility for later mechanists like Laplace to discard the idea of God entirely. (“Sire, I have no need for that hypothesis,” Laplace answered when Napoleon asked him what place God had in his system.)

“Locke’s positions that substance exists (even though it cannot be intimately known), that sensation is the basis of knowledge, and that matter might think, were closely akin to materialism. These elements in Locke’s philosophy encouraged more thoroughgoing materialist conclusions. His influence in that direction can be most clearly seen in the writings of John Toland, of the deist Anthony Collins, and in the sensationalist and materialist schools of eighteenth-century France. [But the scholar Jonathan Israel argues, plausibly, that *Spinoza* had much more to do with this later materialism than Locke did.] But Locke himself did not take a stand firmly and fully upon materialist grounds.”

A rather un-empiricist notion of the empiricists from Locke to Hume was that the highest type of knowledge came not from sense experience but from the direct intuition of the mind: most obviously in the case of mathematics. (But for Locke, moral truths too were as unassailable as mathematics.) Empirical ideas gave only probable knowledge. This argument, of course, is very Cartesian. As is Locke’s idea that we have intuitive certainty only of our own existence: external existence “is not altogether so certain as our intuitive

knowledge, or the deductions of our own reason employed about the clear abstract ideas of our own minds.” As Novack says, it isn’t difficult to arrive at Berkeley’s subjective idealism from this starting point.

Locke’s general atomism obviously correlates with the atomism of capitalism:

[Locke’s “separatism” runs all through his mechanical empiricism.] In his view of nature only particular things exist; in society the isolated individual is the primary reality; in the human mind simple self-sufficient ideas are the basic units out of which knowledge is compounded.

Since Locke starts with dissociated particles, individuals, and ideas, the problem then arises in all the domains of existence: how do these originally independent entities come together? The single principle of unification in his empiricism is mechanical aggregation by way of arithmetical addition. The atoms constitute material aggregates which have only external relations with one another; individuals combine into social groupings and set up governments by means of a contract; the simple ideas which are the elementary components of thought make up complex ideas by way of association.

Empiricism can take either materialist or idealist forms. The French sensationalists of the Enlightenment, including Diderot, Condillac, La Mettrie, Helvétius, and Holbach, developed its materialist side; Berkeley went in the other direction. Proceeding from Locke’s argument that the mind “has no other *immediate* object but its own ideas,” from which it follows that physical objects are not directly experienced but are only inferred from our impressions and ideas, Berkeley simply dropped the concept of external objects. This was especially easy to do since Locke had conceived of matter as essentially passive and inert (a conception with which John Toland disagreed, in 1704). “How could so passive a cause produce the diversity of perceptions that people experience, Berkeley asked.”

Hume, of course, built on Locke and Berkeley to show how their empiricism leads inexorably to a thoroughgoing skepticism. Berkeley had denied that we have any abstract general ideas such as substance or triangle or whatever; we have only particular ideas, because everything we encounter in sense is particular. Hume essentially took over this argument. Whatever wasn’t given in perception couldn’t be an object of knowledge. We can’t know if there’s an external world independent of our senses; we can’t know if a substantial self exists, since we don’t encounter it in our inner perceptions; we can’t know if God exists or the soul is immortal. Our idea of causation has no objective basis. “When we examine our sense perceptions,” Novack paraphrases, “they do not provide any evidence that one event has any necessary or essential connections with one another or that one thing is instrumental in producing another. All that our experience enables us to say, or our reason to know, is that one thing follows another or accompanies another. But there is nothing given in our impressions to warrant the conclusion that one is the cause and the other the effect.” We’re not acquainted with *necessity* in our experience. We simply instinctually *imagine* that we are. (In modern language, we’re genetically programmed to believe all these ideas, or to have all these cognitive structures, that Hume finds problematic.)

It seems to me that, even if one rejects much of empiricism, this skepticism is still unavoidable. I can’t see that Hume is wrong when he says, “Let us fix our attention out of ourselves as much as possible; let us chase our imaginations to the heavens, or to the ultimate limits of the universe; we never really advance a step beyond ourselves, nor can we conceive of any kind of existence, but the perceptions which have appeared in that narrow compass. This is the universe of the imagination, nor have we any idea but what is here produced.” One may disagree with the last sentence, since we surely *do* have “ideas” that don’t arise from perception but that we *bring to* perception, but the general Cartesian and Lockean conception that in a sense we’re imprisoned within ourselves seems obviously true, being confirmed by science. The brain constructs our experience; we’re aware only of what the brain has produced. Thus you get skepticism about the external world and so on. Of course, there must *be* an external world, and we might as well imagine it to be as science describes it, but still, its existence can’t be proven.

“Hume’s skepticism laid the basis for phenomenalism, positivism, empirio-criticism, pragmatism, agnosticism and similar mutations of empirical doctrine which were developed in the nineteenth and

twentieth centuries.” But I’d say it’s certainly possible to admit the irrefutability of skepticism while yet rejecting all these positions.

“Hume also laid the basis for the subsequent pragmatic conception of knowledge by treating ideas as habits or rules of behavior adopted for the practical needs of getting along in the world. In place of the ‘correspondence theory of truth,’ that ideas are valid if they agree in content with their objects, he put forward what can aptly be characterized as the ‘opportunist theory of truth.’ Since our most cherished ideas cannot find a basis and backing in an independent reality then we must treat as true whatever enables us to get along best in everyday affairs. Truth, then, is determined not by the unity of the content of ideas with their references in the external world, but by purely practical considerations of expediency in conduct.”

Positivism, too, was grounded in Humean considerations: for, if we doubt that underlying reality can be understood, it makes sense to focus just on collecting data and drawing superficial connections rather than looking for the fundamental causes behind appearances. In a sense, Hume’s views on substance and causality swept away the foundation of natural and social science—which of course is why they so disturbed Kant. They also led to the idealism of later empiricists such as John Stuart Mill, Ernst Mach, and eventually the logical positivists.

Mill, for example, defined matter as “the permanent possibility of sensation.” As Novack says, “This is a considerable retreat from Locke’s views on the reality of objects in the external world. Mill made the existence of objects depend upon the *possibility* of their being perceived by us. This is a concession, not simply to Hume’s skepticism, but to Berkeley’s idealism which made the existence of objects depend upon their being *actually* perceived by us. Indeed, Mill did not hesitate to proclaim his agreement with Berkeley’s school of subjective idealism.” A. J. Ayer, among other logical positivists, later adopted Mill’s definition of matter.

And yet at other times Mill seemed to accept that there is an external world in which we are implanted, and which science investigates. As the *Stanford Encyclopedia*’s article on Mill says, “Mill’s claim that the process of science involves finding the structure *already present* in nature seems at least in tension with [his idealism].” Yes, very much so! The two positions are obviously contradictory. But Mill’s contradictory stance was that of many empiricists—even though I don’t see any reason why, from their Lockean premises, they were logically bound to adopt idealist positions.

“Mill’s phenomenalism led on to the empirio-criticism and positivism of the late nineteenth and twentieth centuries. These tendencies, starting from the premise that objects are nothing but combinations of sense data, cast doubt on our ability to know material reality and culminate in all kinds of quasi-idealistic conclusions.” Again, I don’t see why accepting the obvious premise that our experiences of objects are “nothing but combinations of sense data”—constructions out of the sensory input the brain is given—necessitates idealism. As for our ability to know material reality, it *is* limited and uncertain. Obviously. The paradoxes and incredible theories of modern physics, which are scarcely intelligible to the human brain, are enough to prove that. In this sense, Hume—and Locke (who was skeptical about humans’ ability to understand everything)—was right. And Novack’s scorn for the notion that human knowledge is necessarily limited is stupid.

Mach was another idealist. “Mach passes over from the proposition that *knowledge* consists of nothing but sensations to the quite different assertion that the *world* consists solely of our sensations. His non-materialist standpoint can be gauged by the following assertion regarding bodies in the natural world. ‘To claim that there are in nature the objective counterparts of this conceptual apparatus is an unjustifiable piece of metaphysics; we may find the concept of a body, for example, useful, but we must not allow ourselves to think that there are bodies in the natural world; we experience only sensations.’” Idiocy.

Novack continues:

Over the past three centuries, the empirical school has exhibited an ever stronger impulsion to break loose from the moorings in material reality already attenuated in Locke’s philosophy and thrash about in a cloudland of self-enclosed sense-data divorced from the external world... The immense distance that latter-day empiricism has traveled from its pristine association with materialism can be measured by contrasting the view of Hobbes

and Mach. Hobbes defined philosophy as reasoning about causes and effects generated by matter in motion and known through sensation and computation. Mach denied that causation was anything more than a conventional and convenient idea [Bertrand Russell, too, cast doubt on the notion of causation], and he was dubious about the capacity of sensations to reach beyond themselves and convey knowledge of an objective world.

In the latter respect, Mach's doubt was well-founded. Sensations in themselves don't necessarily convey accurate knowledge of an external reality (for they're constructed by the brain and aren't really *copies* of anything). For that, we need science.

I'll skip over Novack's uninteresting and confused discussions of Marxism, dialectical materialism, supposed negative effects of "empiricism" on the labor movement, etc. I'd concede to Novack only that empiricism and positivism are indeed suited in many ways to capitalism and opposed both to a radical social science and to advancing the cause of labor. (Superficial investigations of phenomena, atomistic conceptions of society, etc.) See my notes on E. P. Thompson's *The Poverty of Theory*. Novack isn't wrong that "empiricism instills and encourages many harmful habits of thought, [including] inconclusiveness, relativism, impressionism, eclecticism, subjectivism, and skepticism." (What does he mean by impressionism? "Impressionism relies upon personally enclosed or otherwise narrowed experiences as the practical standard for appraising and analyzing phenomena.") A rejection of positivism—liberalism—and its conservative preference for "piecemeal social engineering" can only be good for the cause of radical social change.

Novack's critique of pragmatism is mildly interesting. He argues that "pragmatism is essentially a belated and updated branch of the empirical tradition... Empiricism, pragmatism, and instrumentalism, or its variant, 'operationalism,' represent three consecutive phases in the evolution of the same trend of thought. Empiricism was the matrix, the rudimentary and general form from which pragmatism sprang, while Dewey's instrumentalism is the highest expression of pragmatism."

The pragmatists were unhappy with the state of empiricism in the late nineteenth century. They thought its account of the process of acquiring knowledge kept the body and its senses far too passive: they were pictured as inactive recipients or reflectors of whatever was pressed on them from outside. (The earlier German idealists, products of Kant and early Romanticism, had criticized empiricists along the same lines, as ignoring the active powers of sensibility and thought.) Second, pragmatists thought original empiricism was unhistorical and non-evolutionary. They embraced the idea of biological evolution and emphasized the biological origins and nature of mental phenomena. But "an even deeper defect of classical empiricism was its failure to explain the influence of the *social* environment and its changes upon the origin and evolution of man's knowledge." Unlike Bacon, Locke, and Hume, pragmatists interpreted human nature as plastic and variable, dependent in some respects on the forms of a given society. Dewey was the most profound here, but even he didn't grasp the essence of the materialist method. He did, at least, "make energetic efforts to overcome [the individualism of classical empiricism] by bringing into his structure of thought the social nature of the conditioning, thinking, and functioning of the separate personality."

The pragmatists took for granted some of the old premises of empiricism, such as the sensory origin of ideas and the nonexistence of innate principles in the mind, and occupied themselves with new questions. "They did not ask, Where do our ideas come from? That was for them a settled question. They inquired, Where do our ideas go to and what are they good for? Instead of asking, How did ideas originate and what are their roots? they asked, What functions do they perform and what effects do they have upon further experience?" William James characterized pragmatism as an attitude of mind, a mode of thought, a point of view, rather than a theory of reality or a system of the world.

Among their contributions was to reject the notion of the British empiricists that sense data are intrinsically isolated. James' psychology, for instance, was much more holistic and phenomenological—"stream of consciousness," etc.—than Hume's. And of course the pragmatic conception of truth was different from, say, Locke's. We separate truth from falsity "not by testing [ideas'] conformity with given realities," Novack paraphrases, "but by conceiving what their effects would be and noting the consequences when we act upon them. If an idea does help us get along in this stream of experience, fulfills our needs,

satisfies our desires and demands, then it is true, or rather it becomes true to that extent. ‘An idea is ‘true’ so long as to believe it is profitable to our lives’ [James writes]. And ‘the true is only the expedient in the way of our thinking...in the long run and on the whole, of course.’” A distinctively American conception, you can see. “Whatever works!”

On one side, the pragmatists fought against idealism; on the other side, they fought against materialism. They tended to reject the objectivity of nature and society, instead trying to unite subject and object: both are formed in interaction. For James, nature depends on experience, not experience on nature. Again, a confused and unscientific notion, as well as inadmissibly idealistic.

James proclaimed himself a “radical empiricist”: “To be radical,” he said, “an empiricist must neither admit into his constructions any element that is not directly experienced, nor exclude from them any element that is directly experienced.” Reminiscent of Hume. And quite a naïve position.

His pragmatic understanding of truth and ideas (as nothing but “working hypotheses”) led him to even greater naïveté in his justification of religion. “We cannot reject any hypothesis if consequences useful to life flow from it... If the hypothesis of God works satisfactorily in the widest sense of the word, it is true.” Wow. Okay. That it’s true *for some people* doesn’t mean it’s *true*! Naïve relativism. (You can see here the seeds of Richard Rorty’s even more explicitly relativist conception of pragmatism.)

Novack’s conclusion is perceptive: “Despite their departures from classical empiricism in certain respects, the pragmatists did not break away from its prime postulate that what is presented here and now to the individual affords the best insight into the nature of reality. *Pragmatism remained attached to the phenomenology of experience.* [My italics.] The mandates of its method inhibited persistent search for the inner causal connections in the full scope of their evolution which generate the outward appearances of things.” He goes on to say, “James and Dewey...remodeled [the] ideas [of traditional empiricism] to suit the requirements and outlook of the liberal middle-class intellectuals of their day. Indeed, the pragmatic philosophy had the same relation to empiricism as the political program of Progressivism had to capitalism and bourgeois democracy. It aspired to modernize the structure rather than change the foundations.”

The last chapter of Novack’s book, “Materialism and Empiricism Today,” draws some useful conclusions. It reiterates that empiricism, as such, isn’t or needn’t be opposed to materialism—or idealism. It can take both forms, and has often had a heterogeneous and unstable character. Originally, though, especially in the cases of Bacon and Hobbes, it was allied with materialism. Both outlooks defended the new sciences against medieval authorities, feudal obscurantism, idealism and mysticism. With Locke, the potential grew for the two tendencies to come apart (in Berkeley, to some degree in Hume, and in later empiricists): for “his wobbling on the crucial question of the relation of ideas to the objective world [—e.g., primary qualities inhere in substance (which we’re incapable of understanding) but secondary qualities don’t—] dislodged the empirical theory of knowledge from a firm anchorage in reality and left it susceptible to agnostic and idealist uses.” Materialist empiricism continued among French *philosophes* and in radical circles, but

The ascendancy and conservatizing of the bourgeois regimes in the nineteenth century tended to brush aside the more materialist elements and exponents of empiricism and bring the skeptical conclusions of Hume to the fore. His reasonings against the reality of causation, the existence of substance, and the objectivity of scientific knowledge frayed the materialist ties of classical empiricism, made possible a reinstatement of religious belief through irrational faith, and steered many empiricists onto the paths of agnosticism and, in extreme cases, subjective idealism.

The successes of natural science continued to vindicate materialism, but most British thinkers of the Victorian era refused to be identified with anything so unrespectable.

Since [the mid-nineteenth century], the more popular varieties of empiricism have accentuated their nonmaterialist features. The distance between the two philosophies has been widened by the persistent challenge offered by the systematic materialist teachings of

Marxism to all forms of equivocation and confusion on the principal problems of philosophy prevalent among the empiricists. They in turn have defined their positions in more conscious repulsion against dialectical materialism. This antagonism has been most sharply manifested in the social and political arena, where the confrontations between liberalism and socialism, reformism and revolutionary action, have been tied up with adherence to the rival methods of empiricism and positivism or Marxism.

Thus, starting out as intimate associates in the struggle against medievalism, the two schools of thought now stand arrayed against each other in fields extending from method in natural science to sociology and politics.

A classic example of the opposition of sociological empiricism—or positivism—to Marxism is Karl Popper. Again, see my notes on Thompson's *The Poverty of Theory*. Popper was a dogmatic anti-communist liberal idiot who denied that there are any regularities in history, in effect denying that history can teach us anything. "Non-repetitive events are the most striking aspects of historical development," he wrote. All events are unique, etc. Even the not-very-profound Novack has no trouble refuting such a facile and superficial positivism. ("Social relations themselves refute [the idea that history has no reliable regularities]; they are definite types of perennially repeated mutual interactions among men arising from continuous activities of a definite kind." Productive activities, continuously reproduced economic systems, etc.) Had Popper but read any good historical scholarship, he could hardly have maintained his liberal illusions.

On the other hand, there was some justice in his conviction that it's impossible to know where society is headed, impossible to predict the future in the way Marxism tries to. As Chomsky says, society is just too damn complex for us to know how things are going to turn out. In retrospect, it's possible to discern a logic to historical evolution (contrary to what Popper maintains), a logic grounded primarily in class conflicts; but that logic, and the direction of historical progress, cannot be discerned beforehand. In this sense, Popper's critique of Marxism is valid—though commonsensical. But it doesn't entail that revolutionary social movements are misguided or doomed to utterly fail, as he seems to think they are. (Again, evidently he isn't very familiar with history. The French Revolution, for example, didn't totally fail. Nor did the 1848 revolutions, or the English civil war and 1688 revolution, or the Cuban revolution of 1959, etc. Sometimes revolutionary attempts are *necessary* in order to achieve any progress at all.)

Anyway, on the whole Novack's book is somewhat useful, despite its naive Marxist dogmatism. Draws interesting connections, has some useful historical discussions, and gives a few insightful critiques of empiricism.

Well, I officially got the Ph.D. No idea what the future holds.

June–December

Reading Paul Mason's *Postcapitalism: A Guide to Our Future* (2015). Not a great book, but I figured it's the kind of thing I should know about. Maybe I can incorporate some of its ideas into articles.

Wrote a couple articles for *Truthout* and other outlets:

A 21st-Century Marxism: The Revolutionary Possibilities of the "New Economy"

It should hardly be controversial anymore to say we're embarking on the "end times" of...something. Maybe it's corporate capitalism, maybe it's civilization, maybe it's humanity. Whatever it is, the unsustainability of the contemporary *ancien régime*, on the global level, has become obvious.

Economically, socially, politically, and environmentally, the next fifty years will see major upheavals, which may end up dwarfing those even of the 1930s and 1940s—the Great Depression and World War II.

In this moment of crisis and uncertainty, as we wonder what might come next and if in the long run there is any hope for a *positive* resolution of the predicaments society finds itself in, we would do well to consider whether that old revolutionist Karl Marx has anything to say about our future. His intellectual fortunes, after all, have lately been on the upswing. As the greatest theorist ever of capitalism and revolution, it would be odd if his ideas couldn't illuminate the prospects for social transformation in a time of acute crisis.

Marx was mainly an analyst of capitalism, not a prophet or planner of socialism or communism. He did, however, predict socialist revolution, even arguing that it was inevitable and would inevitably take the form of a “dictatorship of the proletariat.” This dictatorship, supposedly, would implement total economic and social reconstruction even in the face of massive opposition from the capitalist class, in effect drawing up blueprints to plan out a “new society” that would, somehow, on the basis of sheer political will, overcome the authoritarian and exploitative legacies of capitalism. Through necessarily coercive means, the government would somehow plan and establish economic democracy, in the long run creating the conditions for a “withering away of the state.” How such a withering away would actually happen was left a mystery; and none of Marx's followers ever succeeded in clearing the matter up.

In my book *Worker Cooperatives and Revolution: History and Possibilities in the United States*, I have explained how this whole Marxian schema of revolution was always fundamentally flawed, and even, in some respects, blatantly anti-Marxist (i.e., contradictory with the basic premises of Marxism). No such revolutionary *rupture*—a sudden radical break with capitalism in the form of a politically planned, coercively administered flowering of workers' democracy—could ever happen, and ever has happened. Marx misunderstood his own system when he predicted it.

Even the greatest thinkers make mistakes. What is unfortunate is that their followers persist in these mistakes, to the point that even today it seems virtually no one has grasped the contradictions between basic Marxian conceptions of social dynamics and classic revolutionary prognostications that Marx and Engels made in the *Communist Manifesto* and other writings. Further discussion of these matters can be found [here](#).

If we drop the ideological baggage of the “dictatorship of the proletariat,” however, we will find that at a more fundamental level of Marxist theory there is a clue to how a transition out of corporate capitalism may occur—how, in fact, it will *have* to occur, if it is to happen at all. From a broad perspective, there is only one path to a post-capitalist society (leaving out the possibility of nuclear holocaust and total systemic collapse).

Transforming the “economic base”

The key to imagining a *positive* outcome of the decline of the contemporary order lies in the Marxian idea that *production relations* are the foundation of every society. That is, political, cultural, and ideological structures are grounded in class structures. The obvious corollary is that a post-capitalist society can evolve only on the basis of the evolution of new production relations, i.e., class (or rather, ‘*no-class*’) relations. Just as new economic relations emerged over centuries during Europe's transition from feudalism to industrial capitalism—and it was on the ground of these structures that a new society developed—so new ways of organizing production will have to evolve in the coming generations in order for humanity to live to see a less crisis-ridden era than the present.

More precisely, inasmuch as the predatory regime of corporate capitalism is founded on the privatization of resources (of production, profit, the natural environment, etc.) and on authoritarian and antagonistic relations of production, a more just and stable society will have to be grounded in the *public* production and distribution of resources, and in relatively democratic and cooperative economic structures.

As such structures progressively emerge over the next fifty and a hundred years, a new kind of politics will, necessarily, evolve on their basis. The gradual, global “social revolution” will not, and cannot, be politically willed and imposed *after* a seizure of state power, as Lenin attempted and Friedrich Engels

predicted. (“The proletariat seizes state power, and then transforms the means of production into state property.” What you have in this case is just state capitalism.) Rather, the long-drawn-out political revolutions will occur step-by-step as society, in particular the economy, gradually and organically evolves new, more democratic institutions, precisely to the degree that the old economy descends into crisis.

What will the new institutions look like? Marx was wisely reluctant to speculate in detail about the future. But we’re in a more fortunate position than him, because we can already see the seeds of a new economy being planted. They have yet to sprout in a very visible way, but on the grassroots level there are, nonetheless, glimmers of hope.

The new economy

Activism around the “solidarity economy” has in the last decade been garnering more and more attention. Worker cooperatives and public banking, for example, are two concepts that are gaining traction even in the United States, as their growing coverage by journalists and scholars testifies. A recent *In These Times* feature article on public banks describes the remarkable potential of these institutions, as well as challenges the movement faces. But Shelley Brown, an activist from Santa Rosa, is far-sighted in her optimism: “All it’ll take is the first domino to fall,” she says. “Towns and cities will turn in this direction [toward public banking] because there’s no other way to turn.” She might have added that sooner or later, if economic stagnation and crisis persists (which it’s bound to), states will do so as well, compelled by popular movements and widespread unrest to adopt institutional innovations like public banking.

Worker cooperatives have been more prominently featured in the media than public banking, in part because of their striking successes in both Europe and North America. In my abovementioned book I tell the story of how the cooperative New Era Windows was formed several years ago in Chicago, a few years after its worker-owners had, as employees of Republic Windows and Doors, made international headlines by occupying their factory. That was in the wake of the 2008 crash, when the factory was about to close and the workers were being denied severance pay and other benefits to which they were entitled. Five years later, with the help of their union (the United Electrical Workers) and a nonprofit called The Working World, they had turned the business into a co-op.

More such successes may emerge following the next economic collapse. Similarly, to bring back manufacturing jobs to the U.S., more unions may follow the lead of the United Steelworkers in building industrial cooperatives across the country. The cooperative movement is still in its early stages, so one cannot predict what its potential may be. What one can say with a fair amount of certainty is that public pressure will continue to build for measures like these to protect jobs and in so doing transform the economy.

It might seem that such “interstitial” institutions as public banks and worker cooperatives—or even the aggregate of all types of cooperatives, including in the housing, retail, agricultural, insurance, health, and credit sectors of the economy—have little or no revolutionary potential, being too marginal for that. And certainly, for now, this criticism has force. Whether it will still have force twenty years from now, after economic and environmental crises have savaged the dominant political economy and popular movements have had time to build substantial bases of power, is an open question. Given the unpredictability of history, it is myopic to arbitrarily declare that all “localized,” decentralized, municipal or regional attempts to build oppositional institutions will forever be condemned to marginality and cannot serve as nodes of national and international anti-capitalist movements.

The inevitable reaction against neoliberalism

In any case, the necessity of creating *public* forms of economic interaction to save society, in the long run, from the total destruction that will ensue if the privatization and marketization of everything continues unchecked implies that some form(s) of public banking and producer cooperativism will, sooner or later, have to become hegemonic. The hegemony of such institutions is precisely what the revolutionary

goal has always been. “Cooperativism” is just another name for workers’ democracy, which is the ideal that has always guided Marxists and other radicals.

It may be that (as Marxists have traditionally argued) the nationalization of key industries will eventually prove necessary and possible; but the idea of national industries *democratically* run is, in effect, just the idea of worker cooperativism writ large and transposed to the political sphere. The more the idea of democratic administration and ownership—as in municipal enterprise, community land trusts, cooperatives, participatory budgeting, etc.—permeates the public consciousness, the more likely it is that assaults on the commanding heights of corporate capitalism will become feasible.

If dire prophecies of another economic collapse, one even more serious than that of 2008–2009, are borne out, the chaos that follows will surely, in the end, empower “radical reformers” agitating for a more democratic and cooperative political economy—in addition to more conventional progressives demanding a reversal of the international austerity regime. For it is hard to see how in such a scenario popular movements can continue to be suppressed indefinitely, everywhere. And insofar as activists press for a transformation of *production* relations (at the local, regional, national, and international levels)—in the direction of abolishing the private appropriation of profits and the authoritarian, exploitative structures of business—they will be laying the groundwork for truly revolutionary changes. The sorts of changes that will someday, perhaps, make possible a move away from the capitalist “growth economy” that cannot but devour nature, people, democracy, and society itself.

In short, while it’s necessary to abandon the old Marxian conception of proletarian revolution, the central insights of Marxism give us clues into how a gradualist revolution might proceed. We have to embrace the project of slowly building a new economy from the ground up, while continually agitating for changes in national policy that will facilitate such a project. This is what a twenty-first century Marxism looks like.

*

Optimism in the Face of Crisis: How the Left Will Win

It’s always fascinating to observe ruling classes seemingly willfully destroying the conditions for their own future rule. History is black with the ashes of self-immolated wealthy classes, grim reminders of the autosarcophagous nature of infinite greed. In eighteenth-century France there was the parasitic aristocracy that shunted all responsibility for the kingdom’s finances onto the lower classes, thus setting the stage for the French Revolution. Today, there is the parasitic oligarchy that strips the lower and middle classes of everything but their labor-power and their debt, thus setting the stage for...revolution?

Let’s consider some of the remarkable methods the U.S. ruling class, or at least dominant factions of it, are currently using to sabotage their own future rule. To a large extent these devices fall under the category “neoliberal,” which is to say a fetishization of privatization and marketization, but that only obscures their real origin, the dominance of the capitalist mode of production itself. Neoliberalism is but a vicious manifestation and continuation of basic tendencies that have characterized capitalism for centuries, including the monomaniacal pursuit of profit, suppression of popular power, class polarization, increasing capital mobility, unfettered imperialism, the pillaging of the natural environment, etc. The salient difference between now and earlier is that on a global level these tendencies appear to be approaching their limits, reaching such a fever pitch that they’re undermining the possibility of capitalism-in-the-future.

The short-sightedness of infinite greed

Daily headlines testify to the institutional myopia. Congressional Republicans seem to be trying as hard as they can to arouse the enmity of as many people as possible by passing the horrifying American Health Care Act—which is only servicing to build support for a single-payer system. Trump’s tax plan, which admittedly is pie in the sky, proposes “one of the biggest tax cuts in American history” (according to the director of Trump’s National Economic Council)—to benefit the wealthy, who don’t have enough money

yet. More fodder for populist rage on the Left. And, of course, yet another device to “starve the beast,” i.e., hamstringing the federal government’s ability to administer society in such a way that...society continues to function.

Trump’s budget, as we know, is a masterpiece of misanthropy. Among its shining provisions are \$2 trillion of cuts to health programs, a 31 percent cut to the EPA, \$472 billion slashed from income security programs, and \$346 billion of cuts to education, training, and employment programs. It has no chance of becoming law, but since it’s just an extreme version of Republican priorities, it doesn’t bode well for the country’s future. Which is to say, it doesn’t bode well for the ruling class’s untrammelled exercise of power—because of the civic collapse and consequent popular resistance it augurs.

Public education, for instance, has been an integral component of the mass middle-class nation-state, one of the guarantors of relative social order (in part by supporting the *hope*, at least, of social mobility). It isn’t news to say that neither the Trump administration nor the billionaire class as a whole is enamored of public education. They loathe the idea of paying taxes to help people who are “beneath” them, and in fact dislike anything opposed to the gospel of privatization and atomization. And, of course, there’s a lot of money to be made from privatizing education. Hence the ongoing nationwide crusade to destroy public education. State educational funding has been cut in the last decade; tuition at four-year public colleges has simultaneously increased 28 percent, exacerbating the student debt crisis; the spread of charter schools continues to chip away at the funding and the culture of robust public education; and the constant political, budgetary, and media attacks on teachers and their unions basically serve the function of attacking mass education itself.

With Trump and Betsy DeVos at the helm, the war on students, teachers, and public schools is only escalating. In DeVos’s crosshairs are after-school programs, arts programs, childcare programs, money for teacher training and class-size reduction, financial aid for low-income college students, adult basic literacy instruction, etc. Voucher and market strategies, on the other hand, are given over \$1 billion in Trump’s budget.

The most obvious example of the ruling class’s disregard for its own future power and well-being is the case of global warming. If civilization collapses, dragging down with it most life on earth, then, however much the wealthiest of the wealthy try to barricade themselves in Xanadus remote from climate chaos and the misery of the rabble, their quality of life is going to be affected. But as usual, short-term gain matters more than any other value, including long-term self-interest.

It’s true that much of the oligarchy is worried about global warming, as shown by the outrage from even American business interests and politicians over Trump’s decision to withdraw from the Paris Agreement. But the efforts devoted to addressing climate change are pathetic. The corporate media scarcely even mentions it, at least by comparison with the coverage it would get from a genuinely free press. At a time when carbon dioxide concentration in the atmosphere is at an unbelievable 408 parts per million, it is Trump’s probably nonexistent collusion with Russians that obsesses the political and media establishment. We’re on track to hit 500 ppm by 2050. Antarctica’s ice sheet is melting at an accelerating rate. Coastal areas are in danger of being wiped out by the end of the century or earlier. The Amazon rainforest could be a memory within our lifetimes. Meanwhile, even on the state level in the U.S., “the progress [in reducing carbon emissions] is slow,” according to one expert, “and the near-term targets are low.”

The longer the oligarchy abdicates responsibility for the well-being of future generations, the more ammunition it gives to radical popular movements whose aim is to completely transform the American political economy.

Last, I would mention the ruling class’s apparent equanimity regarding the probability of another economic collapse in the near future, possibly a greater collapse than that of 2008–2009. The work of Marxist economists such as David Harvey, Robert Brenner, and the Monthly Review school illuminates the fundamental weaknesses of the American economy from a long-term perspective—weaknesses that have much to do with “excessive capitalist empowerment vis-à-vis labour and consequent wage repression,” to quote Harvey. The only reason the economy functions at all is the existence of a colossal amount of debt, which temporarily solves the problem of low aggregate demand. But, as Reuters columnist James Saft

points out, consumer debt growth—which has lately been occurring at a far faster rate than incomes and the economy are growing—“can’t outpace wages forever.” Corrections, like that of 2008, are inevitable.

The Republican Party is doing what it can to ensure that the next crash is as catastrophic as possible by moving to gut the Dodd-Frank regulations, which would facilitate a resurgence of predatory lending and other practices that led to the 2008 crash.

Of course, the ultra-rich can expect to be bailed out again in the event of a crash. They don’t have much to fear in this respect. What should cause them some concern are the “pitchforks” that will be brandished next time around: the surge of populist rage, largely left-wing (and therefore truly frightening), that will quite possibly signal the beginning of the end of neoliberal hegemony. We should, after all, recall an earlier parallel to our own time: in 1930 organized labor and the Left were in an abysmal state, having experienced a decade of repression so cataclysmic that historian David Montgomery famously referred to it as “the fall of the house of labor.” The unionization rate was at 7 percent, barely above our current private-sector unionization rate. And yet within six years, after the emergence of continent-wide protest movements in the context of the Great Depression, the political economy had moved so dramatically to the left that the U.S. welfare state was born, the federal government was committed to protecting unions, and industrial unionism was making epochal advances that laid the basis for the sustained prosperity of the postwar era.

The case for optimism

The advantage of a Marxian, “dialectical” point of view is that it allows one to see silver linings in developments that look entirely and straightforwardly disastrous. The crises of the present, including the decline of the bureaucratic labor unionism that was integrated into the corporatist structures of the nation-state, present opportunities that leftists ought to embrace. Just as the mature welfare-state in the West didn’t and couldn’t emerge until the horrors of the Depression and World War II had paved the way for it (in part by mobilizing the Left on an epic scale), so the crises of the coming decades will, one can expect, prepare the ground for a reconstruction of society on a more just and democratic foundation.

Said differently, modern history is cyclical. The ferment of U.S. labor and the Left in the Progressive Era—with the IWW, the Socialist Party, the Western Federation of Miners, epidemics of strikes—was finally crushed by the reactionary backlash of the Red Scare and then the triumphalist New Era in the 1920s, when “the business of America [was] business,” as Calvin Coolidge said. The decimation of labor, which suppressed aggregate demand (because of consequent low wages and insecure employment), helped cause the Depression, which saw a revitalization of the Left. During and after World War II, big business launched a remarkably successful counteroffensive (associated, misleadingly, with the name of Joe McCarthy, who was a bit player) that purged politics, culture, and organized labor of almost every hint of leftism.

But this phase of nearly unchecked Cold War corporatism succumbed to the turbulence of the 1960s and ’70s. African-Americans, students, women, anti-war activists, environmentalists, and rank-and-file workers erupted against the repressive bureaucratic regime of centrist liberalism, permanently changing American culture and politics. In response, as we know, business and conservatives mobilized once again, determined this time to annihilate organized labor and the New Deal state itself, which they saw as a challenge to their power and profits. Thus came neoliberalism, another triumphalist “New Era” of savage repression and “end of history” propaganda (this time with a dash of postmodernism thrown in for good measure). By 2017, we’re overdue for the next left-wing phase of the cycle.

But this time it’s going to be different. It’s not just another phase that will be followed by a reactionary backlash. As I’ve argued at length in *Worker Cooperatives and Revolution: History and Possibilities in the United States*, the unique historical role of neoliberalism has been to bring the long epoch of capitalism to its global consummation—which, in classic dialectical fashion, will end up precipitating its downfall. In fact, the nation-state system itself, which is integrally connected to capitalism, is in the early stages of its long decline. The political economy of privatization and social atomization on the one hand, and transnationalism on the other, that has emerged on the basis of information technology deployed in a neoliberal context is unraveling the social fabric of the nation-state—in part by facilitating

the emergence of a *global* consciousness and the undermining of a *national* one. This, in turn, is making possible the rise of global social movements (which, incidentally, are what Marxism was all about to begin with: “Workers of the world, unite!”).

The decline of the middle class presents dangers in the form of semi-fascism, but, unfortunately, it is necessary if we’re ever to transcend corporate capitalism. The middle class, after all, has historically been the conservative bastion of an inequitable social order. As it collapses, many of its members will be seduced by the political right, but others—together with the majority of the lower classes and minorities—will join progressives and radicals. Both Jeremy Corbyn’s success in Britain’s recent election and Bernie Sanders’ enormous popularity demonstrate that the left-wing has but to broadcast its message effectively in order to build a mass popular movement.

The coming decades are going to see the apocalyptic struggle between labor/humanity and capital (particularly the most reactionary sectors of capital) that Marx prophesied but for which he got the timeline wrong (not foreseeing state capitalism and the welfare state). As the least progressive sectors of business struggle to push capitalism to its most misanthropic, world-destroying extremes, liberal and leftist institutions will acquire more support from the populace, more resources, and more power. They already are. The precise dynamics of this process can’t be foreseen, but that it will happen can be predicted with near-certainty simply given the cyclical/dialectical logic of history. The only alternative is total repression of the population for an indefinite period of time—which, since we don’t live in Nazi Germany, isn’t an option.

It’s unlikely we’ll see a return to twentieth-century social democracy, because the nationalistic, heavily unionized political economy that produced that social formation is dead. It has succumbed to relative fragmentation and atomization. Instead, we’ll see momentum grow behind more radical initiatives like the democratization of ownership—which is proposed in the Labor Party’s manifesto and has been championed by Bernie Sanders and other senators. The very structures of government and the economy will be thrown into question as the idea spreads that humanity’s current predicament is a direct product of these structures. Popular pressures to address global warming will reinforce and align with anti-capitalist movements, as it becomes clearer that only radical changes in the economy will be adequate to meet the ecological threat. The very inseparability of all the crises afflicting the country and the world—militarism, the privatization of resources, climate change, income inequality, economic stagnation, unemployment—will foment wholesale popular radicalization.

Moreover, the fact that the victims of the stagnant status quo include huge numbers of young people is extremely dangerous to the oligarchy. The youth will be the shock troops of the revolution.

One of the lessons of history is that the longer an elite prevents change from happening, the more it ensures that the change, when it comes, will be radical and all-encompassing. The French royalty learned this to its cost when it was swept aside by revolution in the 1790s. Tsar Nicholas II learned the lesson when his hidebound conservatism eventually empowered the Bolsheviks and got him and his family massacred. The Southern plantation aristocracy in the U.S. learned it when its viciously reactionary politics and unwillingness to compromise led to the Civil War and slavery’s abolition. The U.S. ruling class learned it when its crushing of labor in the 1920s indirectly led to a flood of progressive legislation in the 1930s. And in the next couple of decades, our ruling class is going to learn the lesson once again.

*

The Necessity of a Moral Revolution

We’re embarking on a revolutionary era, an era that promises to be more radical even than the 1930s. No society of overwhelming decadence and moral rot, luxuriantly productive of Steve Bannons and Anthony Scaramuccis, is destined to last very long. No society that can throw up a bewigged slug as its leader has much of a future. As it parasitizes itself to death, new social forms are bound to sprout in abundance (through the energy of activists and organizers).

The core of the protracted revolution, of course, is to create new institutions, ultimately new relations of production. Every revolution is essentially a matter of changing social structures; the goal of transforming ideologies makes sense only as facilitating institutional change. Nevertheless, to spread new ways of thinking, new values, can indeed serve as an effective midwife of revolution, and thus is a task worth undertaking.

The fundamental moral transition that has to occur (in order, for example, to save humanity from collective suicide) is from a kind of nefarious egoism to a beneficent communism. This is the ideological core of the coming social changes, this shift from individualistic greed—“Gain wealth, forgetting all but self”—to collective solidarity. We have to stop seeing the world through the distorted lens of the private capitalist self, the self whose *raison d'être* is to accumulate private property, private experiences, private resentments, finally private neuroses, and instead see the world as what it is, a vast community stretching through time and space. Such a change of vision might facilitate the necessary institutional changes—which themselves, later, will naturally engender and instill this communist-type vision.

The very notion of “private property,” of “this is mine, and I alone earned it,” has to be recognized as a form of moral idiocy or insanity. Here, I would do better to quote the old anarchist Kropotkin than to offer my own formulations, which would pale beside his. In his classic *The Conquest of Bread*, Kropotkin explained just how *stupid* is the idea of entitlement to a private piece of property (as though “no one else deserves it”):

Take a civilized country. The forests which once covered it have been cleared, the marshes drained, the climate improved. It has been made habitable. The soil, which bore formerly only a coarse vegetation, is covered today with rich harvests... Thousands of highways and railroads furrow the earth, and pierce the mountains. The rivers have been made navigable; the coasts, carefully surveyed, are easy of access; artificial harbors, laboriously dug out and protected against the fury of the sea, afford shelter to the ships...

Millions of human beings have labored to create this civilization on which we pride ourselves today. Other millions, scattered through the globe, labor to maintain it. Without them nothing would be left in fifty years but ruins.

There is not even a thought, or an invention, which is not common property, born of the past and the present. Thousands of inventors, known and unknown, who have died in poverty, have cooperated in the invention of each of these machines which embody the genius of man. Thousands of writers, of poets, of scholars, have labored to increase knowledge, to dissipate error, and to create that atmosphere of scientific thought without which the marvels of our century could never have appeared. And these thousands of philosophers, of scholars, of inventors... have been upheld and nourished through life, both physically and mentally, by legions of workers and craftsmen of all sorts...

By what right then can anyone whatever appropriate the least morsel of this immense whole and say – This is mine, not yours?¹

As he goes on to argue, the wage system itself, which is conceptually and institutionally a close relative of private property, is morally absurd. And not only because it's repugnant for people to be forced to rent themselves to others in order to survive. Or because wage-earners necessarily can't receive the full equivalent of the value they have produced (for then the capitalist couldn't make any profit). Perhaps equally ridiculous is the idea that it's possible to “measure” labor at all, to quantitatively compare workers' contributions, when there are so many qualitative differences between the work that each person does. How

¹ Peter Kropotkin, *The Conquest of Bread and Other Writings*, ed. Marshall Shatz (New York: Cambridge University Press, 1995), 13–16. More concisely, “the means of production being the collective work of humanity, the product should be the collective property of the race. Individual appropriation is neither just nor serviceable. All belongs to all. All things are for all men, since all men have need of them...and since it is not possible to evaluate everyone's part in the production of the world's wealth.”

can one say whose work is more valuable than another's? Why should a plumber's work be considered less valuable than an engineer's? Why a financial consultant's more valuable than a sanitation worker's? (If anything, the reverse makes far more sense.)

The only principle that makes logical and moral sense is “to put the *needs* above the *works*, and first of all to recognize *the right to live*, and later on *the right to well-being* for all those who take their share in production.” Society has to be rid, once and for all, of the obsessive “*who deserves what?*” mentality, the *apportioning* mentality, the “*mine vs. yours*” pathology.

“If middle-class society is decaying,” Kropotkin writes—thereby, incidentally, proving the timelessness of his thoughts—“if we have got into a blind alley from which we cannot emerge without attacking past institutions with torch and hatchet, it is precisely because we have given too much to counting. It is because we have let ourselves be influenced into *giving* only to *receive*. It is because we have aimed at turning society into a commercial company based on *debit* and *credit*.”¹

Actually, as I've written elsewhere (following David Graeber), even contemporary capitalist society, whose utopia is to make everyone an enemy of everyone else (that's what thoroughgoing privatization would mean), couldn't function without a substratum of implicit communism. Everything would instantly break down if people stopped giving what they could to those in need, whether money, time, free labor, gifts, advice, ideas, or encouragement. Social life itself is essentially communistic, based on community, generosity, and sympathy. The general systematization of private property is a perversion.

Kropotkin's arguments suffice to answer the misanthropic refrain of conservatives that “it's wrong to give something to people who have done nothing to earn it.” But other answers are possible. One might point out that people born into the middle or upper class have done nothing to “earn” their privileged position. The wealthy haven't earned the inheritance they receive from their parents. White Americans didn't earn their skin-color or the fact that they weren't born in, say, a Haitian slum. People who benefit from charisma or physical beauty or intelligence did nothing to earn that; they were born with it. They deserve no credit for it. Somebody who happens to meet the right person at the right time and is launched on a successful career is the beneficiary of luck—as, in short, every “successful” person is, in innumerable ways.

Nor does any of this begin to address all the ways that the wealthy or corporations or Silicon Valley entrepreneurs benefit from state policy designed to give them what they want and to strip the poor of the right to live. Through the agency of the state (e.g., its corporate welfare programs, defense budget, patent and copyright protections, and, to some extent, interest payments on bonds), the population subsidizes the power and wealth of people whose ideology is to shame those who benefit from state programs. According to their own ideology, then, these “libertarians” in the business class ought to have their property confiscated, since, strictly speaking, they have “*earned*” none or little of it.

In fact, to the degree that our economy has become mainly a rentier economy, owned by parasites on the productive labor of others, it is sheer farce to talk about property-owners' *right* to their wealth—which is to say *their right to exclude others from ownership*. For where would this right come from, if there isn't even a *pretense* of their having earned all they own? How rich would Bill Gates be without the “rent” he receives from ridiculously stringent copyright protection for Windows and other Microsoft products? He is merely the lucky beneficiary of government policies that serve to hinder the diffusion of knowledge and wealth.

All this private property-exalting thinking, therefore, has to be cast aside onto the dung-heap of history. Rather than Reverence for Property, we ought to strive for something like the Reverence for Life that Albert Schweitzer wrote about and embodied. That is, we ought to explicitly embrace the moral communism (“From each according to his abilities, to each according to his needs”) to which we're already implicitly committed whenever we act as though guided by the Golden Rule, which is to say whenever we act morally at all. To be moral is, in essence, to act like a communist.

“Let us go then, you and I,” and bring forth the moral revolution.

Reading George Crowder's *Classical Anarchism: The Political Thought of Godwin, Proudhon, Bakunin, and Kropotkin* (1991).

[...]

Murray Bookchin's *The Next Revolution: Popular Assemblies and the Promise of Direct Democracy* (2015), a collection of essays. Also parts of John Holloway's *Change the World Without Taking Power: The Meaning of Revolution Today* (2002). It's a flawed book, repetitive and verbose, which, absurdly, doesn't want to have anything to do with considerations of power. Even though, um, to change the world, by definition it's necessary to change relations of power. I.e., it's necessary for ordinary people to "take power" in some sense. Suggests some interesting conceptualizations, though, and gives a few of the same critiques I have of Marxist statism.

Bookchin's thinking is flawed too, quite superficial and silly on various points.

I'm adjunct teaching at a couple of colleges in New York City (and also doing private tutoring). Surveys of U.S. history. Here's part of one of the syllabi I wrote, a quite different sort of document than the syllabi of most history professors:

HIST 104: AMERICAN HISTORY SINCE THE CIVIL WAR

Course introduction

To study the second half of U.S. history is to study how the world arrived at the present moment. If you're interested in the present, then you should be interested in the past, which formed the present. If you're interested in the future, there is no better way of equipping yourself with the tools necessary for acting intelligently than by studying the past. Indeed, the novelist William Faulkner was right when he said, "The past is never dead; it's not even past." It lives on in cultural and political traditions, in economic practices, in the ways we think about the world. These are all, in large part, residues. *We inhabit a world of residues—we inhabit the past*—even as we're constantly trying to build a new world, to act *freely*, not dominated by the past. But the most effective way to even *partially* achieve this goal—this goal of free and intelligent action, free and intelligent thinking—is to understand where we came from, the social context into which we were born, rationally critique it, and thereby rise above it. The alternative is to remain mired in the dogmas, prejudices, and propaganda of the past.

Every teacher has a particular interpretation of his subject-matter, a particular intellectual background that determines what he emphasizes in his lectures and what he omits. In the first class I'll describe my own perspective on history, the ideas and interpretations that will guide the lectures. Here I'll just list some of the course's main themes:

1. The importance of *class*, and of conflict between classes, in shaping history. Examples include the conflicts between slave and master, sharecropper and landowner, wage-earner and capitalist, industrialist and banker, debtor and creditor, tenant and landlord, etc. But the major conflict is between worker and property owner, over both *control of production* and *remuneration of labor*.
2. The tortured progress of industrial capitalism in spreading its dominion to ever more spheres of life, as the country has evolved from predominantly agrarian to primarily urban and industrial (and finally post-industrial).
3. The concomitant growth of the federal government, which has been a key element in the relentlessly advancing bureaucratization of life and society. (But at the same time, massive government "intervention" in the economy and society has been absolutely necessary and frequently beneficial—a fact that contradicts popular ideologies exalting "small government" and the "free market.")

4. The ever-deepening tendency for the U.S. to project its economic, political, and military power abroad, until by the 1990s it was the world's sole superpower.
5. The cyclical nature of U.S. history.

In short, in this class we will not only learn *what happened* in U.S. history from 1865 to the early 21st century, what some of the most significant economic, political, and cultural developments were, from Reconstruction to Franklin Delano Roosevelt's New Deal to the social movements of the 1960s to the rise of information technology. We will also study *why* these things happened. I'll suggest certain perspectives and explanations that I find compelling, which you'll be free to accept or reject. At all times I'll not only tolerate but *encourage* disagreement with my suggestions, both in class and in the papers you'll write. The essence of exciting intellectual interactions is to encounter ideas with which you might disagree but that, at the same time, encourage you to formulate your own opinions in a sharper and more sophisticated way than before. [Deleted the rest of the syllabus.]

I'll also copy my first two/three lectures here—the lecture notes—in case you're interested. The second/third one on the postbellum South was far more detailed than necessary, as became clear when I was giving it in class. (It was based mostly on Eric Foner's classic book on Reconstruction.) So I left out lots of the details I'd written down.

Why study history?

We live in an anti-historical time. A culture of instant gratification, material consumption, entertainment, instantaneous soundbites, video games, the internet—the present moment and the immediate future. The past isn't sexy; it's seen as boring and primitive. We want the quick fix. All this is the exact opposite of the spirit of historical inquiry, which demands patience, empathy, a capacity for sustained concentration.

So the study of history isn't fashionable. On the other hand, that makes it even more important. As Santayana said, "those who forget history are condemned to repeat it." And that's not a pleasant prospect: history is full of horrible catastrophes and injustices. By studying the past, it's possible we can mold the future in a more positive way

There's a lot to learn from history. (First paragraph of syllabus.) More specific lessons, from Paul Street:

History properly and deeply understood is profoundly dangerous to authority. Consistent with Santayana's oft-quoted remark that "those who cannot remember the past are condemned to repeat it," it warns us about past mistakes. National leaders' remarkably recurrent faith in splendid little wars that will be concluded quickly with little human cost is one among many examples.

It raises alarms and teaches lessons about the folly of imperial and environmental overreach and the related terrible consequences of the excessive concentration of wealth and power.

It counsels us not to repeat past *crimes* (not merely mistakes) like slavery, colonialism, genocide, and fascism.

It catalogues, frames, and explains horrors that should never be allowed to recur.

It tells remarkable and inspiring stories of popular resistance, rebellion, and revolution – of people making history from the bottom up, with radical and egalitarian ideals and movements ruling classes and “power elites” natural want consigned to “the memory hole” (Orwell’s phrase).

It is full of lessons about how ruling classes and power elites rule and how ordinary people and activists have confounded masters.

It tells us that humanity survived and often thrived for most of its experience without the hierarchical class structures of capitalism.

It reminds us that the “modern” (and yet pre-historic) bourgeois mode of social and political relations is historically specific and transient, not the “end of history” or the logical destination or culmination of “human nature.” (This helps us imagine and work for a different and much less stratified and destructive society in the present and future).

It points to contingency and alternatives, reminding us that significant, even revolutionary historical change is possible and related to human agency, both individual and collective.

It takes us to the developmental taproots of contemporary problems like sexism, classism, racism, imperialism, militarism, and ecocide, showing how and why all of these evolved over time out of decisions and paths taken by human beings, not the mysterious workings of some dark, all-powerful deity and/or “human nature” – or some other form of imposed destiny. (How understand contemporary racial inequality and oppression in the U.S. with no grasp of the origins, nature, and consequences of Black chattel slavery in British Colonial North America and the United States through the Civil War?)

It helps us recognize and identify deadly developments in the present. It’s useful to know what classic fascism was in Italy and Germany as a neofascist president holds power in the U.S. and as neofascists like Marine Le Pen and Geert Wilders vie for power in Western Europe. Those who don’t know what fascism was *and how and why it arose* in the 20th century may be condemned to live under a 21st century version of it today.

Aside from all the specific lessons that can be learned (which we’ll discuss later), history is, of course, an indescribably vast and rich domain. It *should* be perhaps the most interesting of subjects, because in a sense it includes everything! Music, literature, the arts, philosophy, science, politics, war, religion—history is everything. Even the U.S.’s relatively short history is far too rich to be adequately summarized in a semester or two.

So it isn’t easy to know what to focus on in a single course. Incidentally, if you have suggestions of topics you’d like me to cover, let me know...

I disagree with the way history courses are usually taught. (Boring, etc. Ask for students’ thoughts on classes they’ve had?) Usually the past is only *described*—a bunch of things happened...—and it isn’t made very relevant to the present or to students’ lives. It doesn’t have much intellectual content. But I think it’s also important to try to *explain* things. Using general ideas that we can then apply to our own time (because, after all, it is the present and future that should be our most immediate concerns). As in the natural sciences, so in history the only way to make sense of enormous amounts of data is to use certain abstract ideas to place the data in comprehensible relations with each other.

So that's what I'll do in this course. A pretty different approach than is usually done—in part because if you bring in ideas and try to explain things, the discussion can get somewhat political. And teachers want to avoid politics. But I think that's a risk we have to take, because ideas are important.

So throughout the semester I'll put forward various perspectives that might be a little controversial...but I encourage dissent. (Refer to syllabus.)

#1: Class conflict. It sounds Marxist, but it's important. Can be conscious or unconscious, explicit or implicit. Every complex society is full of such conflicts, such institutional clashes, and they provide the economic infrastructure around which the society is organized. Culture, politics, and ideologies follow in the wake of class, for the simple reason that one needs *resources* in order to influence culture and politics; and it is class (roughly, occupation) that determines the distribution of resources. Therefore, in the final analysis it is class relations—which is to say the antagonisms, alliances, and differences in power between various classes—that broadly determine social phenomena and the trajectories of history.

Materialism vs. idealism. I'm a materialist; others can be idealists. Loosely speaking: ideas and culture are largely a reflection of society vs. society is basically a manifestation of, and guided by, ideas. (A long-running split between the two schools of thought; materialists are often more left-wing, idealists more conservative. Materialists think it's essential to change *institutions*; idealists care more about changing ideas. Care more about culture and so on than economic structures or class. People like Milton Friedman, for instance, like to talk about abstract ideas like “the free market”—or entrepreneurship, thrift, free labor, free enterprise, limited government, etc.—while materialists prefer to examine how institutions actually work. Abstract ideas can obscure how society really functions.) But ideas don't act by themselves; they need entities with resources (money) to propagate them. Besides, people generally act on the basis of their *interests*—they want money, shelter, security, power, recognition, status—and interests are defined economically. So the economy is most important.

We'll see how different groups of people, different classes, have different ideological agendas. (E.g., many slaveowners thought slavery was intrinsically moral and divinely ordained—because that was in their economic interest. Businessmen often think of humans as innately greedy and selfish—because that justifies their own activities.)

Of course, class isn't the only factor that determines history. You need a compromise between materialism and idealism. Other factors include sex (male/female), sexuality, race, and gender. But these are all influenced by class. Like race and racism: as we'll see, they've been propagated by rich and powerful people and institutions (big business) in order to divide the working class. Because working-class unity, organized labor, is a threat to the profits and power of the rich.

Given the significance of class, we'll find it's possible to make generalizations that give some sort of coherence to American history. One such generalization, for example, is expressed by the American linguist and activist Noam Chomsky as follows: “The history of the United States is a constant struggle between these two tendencies: pressure for more freedom and democracy coming from below, and efforts at elite control and domination coming from above.” Throughout the semester we'll see abundant evidence for this statement. It isn't because the “elite” consists of bad or evil people; it is simply because it's in the nature of power to try to maintain and expand itself, to become more powerful. This is a fact one must understand in order to grasp history.

Most of it just comes down to *capital vs. labor*. Intrinsically opposed interests—and that gets you the history of the labor movement, of Communist and Socialist parties, etc.

Sounds political and partisan, yes, but I think we'll find it's also true. You're free to disagree if you want to, though, and can say so in papers and in class.

#2, etc.: refer to the syllabus...

Lecture Two/Three

The current resurgence of white supremacy—Charlottesville, Trump, the alt-right, neo-Nazis—shows that the legacy of slavery, the Civil War, and Reconstruction continues. Whites continue to scapegoat blacks and immigrants for their economic and political problems, as in the late nineteenth century. As we'll see, racial and ethnic divisions between workers in the U.S. have always hindered class-based movements against the rich, and have been one reason for America's relative conservatism.

Dismal history of blacks in the U.S. Slavery, a brief opening during Radical Reconstruction, then sharecropping, Jim Crow, and industrial re-enslavement until World War II (except for those who went up north during the Great Migration—although that wasn't a pretty story either), then some improvement in 1950s, '60s and '70s, then again the criminalization of black life. But for a different reason this time: after Reconstruction it was to control labor and secure cheap labor, while after the 1960s it was to control a population that, with deindustrialization, had become economically superfluous—and also dangerous, as the 60s had shown. Thus the drug war, the war on crime, and in general the war on the poor.

So on one hand the history of Reconstruction is the history of oppressed people (and their white allies) struggling for more power and freedom against former slaveowners and reactionary power-structures that want to keep them subordinate and in as close a condition to slavery as possible. Basically class struggle, but with a racial dynamic. On the other hand, the Civil War and Reconstruction are a story of expanding state power, expanding federal bureaucracies, which anticipates the later massive growth of government to administer a society full of class and racial conflicts. The end of Reconstruction signaled the end of this phase of remarkable state expansion; but expansion resumed at the turn of the century.

Because of the war's financial demands, Congress "adopted economic policies that promoted further industrial expansion and permanently altered the conditions of capital accumulation." Created a national paper currency, an enormous national debt, and a national banking system. To raise funds it increased the tariff and imposed new taxes. The Homestead Act offered free lands to settlers (to promote agricultural development). And there were enormous grants of land and government bonds for internal improvements like the transcontinental railroad, "which, when completed in 1869, expanded the national market, facilitated the penetration of capital into the West, and heralded the final doom of the Plains Indians." (Eric Foner)

All this shifted the balance of economic power in the North. A new and powerful class of financiers was created, wealthy people and institutions that benefited from high tariffs (which protected the growth of industry in the following decades), high inflation that raised prices and lowered real wages, and the payment in *gold* of interest on bonds. The new national banking system helped promote future investment in industry and commerce—and it was controlled by Wall Street. "As a result, the West and, after the war, the South found themselves starved of capital." This contributed to the South's later backwardness.

The birth of the modern American state. ("War is the health of the state.")

From a broad perspective, the Civil War and Reconstruction signified a second American revolution. And not only because slavery so contradicted the original ideology of liberty and democracy, thus making a mockery of the U.S.'s revolutionary heritage. Two very different labor systems, two economic systems, existing in the same country was an unsustainable situation. There was bound to be an epic clash sooner or

later. Since Northern industrial capitalism was far more dynamic and wealth-generating than Southern slavery, which in some ways was like feudalism, in the long run the South's system was doomed. It succumbed to capitalism and the market system. But it did take a long time for the process to be completed—until after World War II actually. Massive federal government intervention was necessary, as we'll see later. (Contradicts the ideology of the free market, limited government, etc.)

*

After the Emancipation Proclamation blacks flooded into the Union army—eventually 180,000. Were treated and paid badly (in segregated units) but nevertheless played a crucial role in winning the war and defining its consequences. Because of their service, blacks necessarily acquired a new *status* across the country. They began to be treated as equals under the law (military law). Large numbers learned to read and write. White Union soldiers, too, learned about the horrors of slavery as they served in the army.

History shows that military service sometimes has a politicizing and radicalizing effect. Guerrilla armies, American Revolution militias, and during and after World War II. Likewise with the Civil War. According to a Northern official: “No negro who has ever been a soldier can again be imposed upon: they have learnt what it is to be free and they will infuse their feelings into others.” Blacks who had served became prouder and more militant; many later were political leaders of Reconstruction.

Military experience contributed to blacks' spirit of resistance during Reconstruction that foiled the most oppressive and reactionary plans of Southern whites.

What freedmen wanted was genuine freedom. Their own land, political equality, legal equality, etc. Something (at least land-wise) like what General William T. Sherman gave 40,000 of them in January 1865 with his Special Field Order No. 15, which confiscated a vast stretch of slaveowners' land along the coast of South Carolina and Georgia so each black family could have forty acres. In the months after the war ended, blacks organized endless mass meetings, parades, petitions, and political education clubs to demand civil equality and suffrage. They were far from passive: didn't just let whites decide their political and economic fate.

In fact, as the war approached its end, blacks started *living out* their emancipation by creating and expanding a whole civil society, a whole culture, of churches, schools, mutual benefit societies, clubs, and so on. It had already existed but now, in the postbellum years, was consolidated, thus laying the foundation of the modern black community. Burial societies, debating clubs, drama societies, trade associations, equal rights leagues. Ubiquitous processions and celebrations in Southern cities; a very vibrant culture.

Also a transformation of religion—the creation of an independent black religious life. Whites wouldn't let blacks have an equal place in white churches, and anyway ex-slaves wanted to be free of white control, so they formed their own separate churches (usually Baptist). Emotional services full of shouting, fainting, music, dancing. Later led to gospel music.

Almost as significant as the role of religion was freed slaves' passion for education. Practically an obsession. Wanted to read the Bible, but also wanted economic advancement, and more generally independence and self-improvement. Set up classes wherever they could—in abandoned warehouses, billiard rooms, churches, former slave markets, basements, private homes, and eventually in schoolhouses that were built through fundraising campaigns, donations, and money from the Freedmen's Bureau. All this institution-building that happened during Reconstruction fostered political awareness and the growth of a culture that united former free blacks and former slaves.

A key element in blacks' postwar project of self-empowerment was the Freedmen's Bureau. Created by Congress in March 1865, its purpose was to distribute clothing, food, and fuel to destitute freedmen, and to oversee "all subjects" relating to their condition in the South. So, very ambitious, even though it was planned to last for only one year! And Congress didn't even appropriate funds for it! It had to get its money and staff from the War Department.

Perhaps its most significant accomplishment was to help establish thousands of schools in the South (especially in towns and cities), and thereby to help lay the foundation for Southern public education. Also established the first black colleges in the South. The Bureau created an extensive network of courts, hospitals, charitable institutions, and labor regulations, but most were intended to be temporary. So weren't as effective as they could have been. Especially difficult to protect blacks from the rampant violence they were subject to. The Bureau soon phased out its own courts, but Southern courts were of course wildly racist.

The goal of Northerners—especially Radical Republicans—and Bureau leaders was to remake the South in the image of the North. The free market should structure social relations. Free labor, wages, capitalism. Many Northern businessmen wanted to lift up blacks materially and socially so there could be a vast new market for Northern goods. Even though black suffrage was necessary to create the political conditions for Northern investment in the South. (This led much of the business community to support Radical Republicans. But other businessmen disagreed: didn't want to disrupt the cheap Southern labor force, and wanted cotton production to resume as fast as possible.)

These goals were utopian, though. In fact, immediately after the war the army was mainly concerned with compelling freedmen to return to plantation labor. Thought it could be regulated by a system of wages and free labor, but planters wanted to recreate their earlier absolute power as closely as possible. By 1866 the Bureau was forcing blacks to sign annual contracts to work on the plantations. Were often treated brutally and viciously exploited, and couldn't leave. Hardly "free labor," especially because landless freedmen had basically *no other option* and were fined or imprisoned if they went on strike.

Freedmen had hoped the government would give them land—and in 1865 the Bureau did try to settle many of them on the 850,000 acres of abandoned land it controlled. Wanted to create a class of black small farmers, an independent yeomanry. (Jeffersonian ideal, Radical Republican ideal.) This *could* have meant a major social revolution, a total reconstruction of the Southern class structure. But President Johnson overruled the Bureau and restored land that had been abandoned and confiscated to Southern planters, former Confederates he had pardoned. He also forced the tens of thousands of freedmen who had settled on Sherman's reservation off the land, which was restored to rich planters. There was massive resistance, but poor blacks didn't stand a chance against the army and the white power-structure. 1865 and 1866 were thus years of terrible betrayal, and were felt as such. As one freedman said, blacks had been left with "no land, no house, not so much as place to lay our head... Despised by the world, hated by the country that gives us birth, denied of all our rights as a people, we were friends on the march,...brothers on the battlefield, but in the peaceful pursuits of life it seems that we are strangers."

Planters tried to revive the antebellum gang-labor system, which was reminiscent of slavery. But in most cases blacks were able to resist this. Preferred more decentralized and less-closely-supervised forms of work. Sharecropping thus emerged (on cotton plantations)—a compromise—and gradually (over decades) became overwhelmingly dominant. Individual families signed contracts with the landowner and became responsible for a specified piece of land. Generally retained a third to a half of the year's crop. Far from an ideal system, but at least granted blacks some autonomy from white supervision.

A new class structure therefore slowly emerged. By 1900, 70 percent of farmers in the South (including whites) were tenants and/or sharecroppers. A rural proletariat. Reliance on a few cash crops—sugar, cotton,

rice—instead of a diversified agricultural system. (Bad because too many producers: prices were pushed down, and if the world market was glutted, farmers were screwed.) Endemic poverty and a largely stagnant society.

*

Presidential Reconstruction. Lincoln had favored a lenient Reconstruction policy: general amnesty to white Southerners who would pledge an oath of loyalty to the government and accept the abolition of slavery. When 10 percent of a state's total number of voters took the oath, those loyal voters could set up a state government. He also wanted to extend suffrage to blacks who were educated, owned property, or had served in the army. The radicals thought this plan was far too mild.

Hoped Andrew Johnson would be more on their side, since he hated the planters and insisted that traitors must be punished. Initially seemed to crave revenge for mass treason. But it turned out he was a fanatical racist (former slaveowner) committed to white supremacy even more than punishing traitors, so he quickly adopted a policy even more lenient than Lincoln's. Appointed provisional governors who opposed black suffrage. When the Southern states in the fall of 1865 elected legislators, governors, and members of Congress—for they had fulfilled Johnson's conditions for readmission to the country¹—they tended to elect white supremacists, former Confederates, and members of the old elite. Which antagonized the North and ultimately helped cause the rise of Radical Reconstruction.

So did the Black Codes that were being passed around this time, to return things to as close to slavery as possible. "Crimes" like being unemployed or using insulting gestures could be punished with severe fines; the criminals could then be hired out to private employers who would pay the fines. Basically debt peonage. Almost slavery. In some cases blacks were forbidden from taking jobs other than as plantation workers or domestic servants.

Also heavy poll taxes on freedmen, and very low taxes on landed property.

Many Northern capitalists supported Johnson's white supremacist policies because they were useful for controlling labor. (That's always what the capitalist wants. A docile labor force.) But luckily Radical Republicans came to blacks' rescue, for a time. (Irony about the Republican party—then and now.) The core of their ideology: use a powerful national state to guarantee blacks equal standing in the political system and equal opportunity in a free-labor economy.

So in the spring of 1866: another Freedmen's Bureau bill and the first Civil Rights Act. (Both vetoed but that was overridden.) CRA: everyone born in the U.S. (except Indians) was a national citizen and had certain rights: making contracts, bringing lawsuits, and enjoying "full and equal benefit of all laws and proceedings for the security of person and property." Nullified Black Codes. Gave the federal government some enforcement powers too, though not nearly enough. Very radical bill for its time, which also invalidated many discriminatory laws in the North. And was ahead of its time in its expansive conception of the national state. But said nothing about voting.

That summer Congress also approved the Fourteenth Amendment and sent it to the states for ratification. Its essence was a national guarantee of equality before the law. Sort of a Constitutional and therefore ironclad version of the Civil Rights Act, and so carried forward the state-building process born of the Civil War.

¹ Revoke the ordinance of secession, abolish slavery and ratify the Thirteenth Amendment, and repudiate Confederate debts.

By now there was an open break between Johnson and nearly the whole Republican party. In the 1866 congressional elections the Radicals won a majority of seats, so didn't have to worry much about Johnson's opposition. Actually the intransigence of Johnson and the Southern states helped their agenda. *Beginning of Radical Reconstruction*. They passed the Reconstruction Act of 1867: the eleven Confederate states (except Tennessee, which had ratified the Fourteenth Amendment) were divided into five military districts. A military commander governed each district and registered voters (adult black males and white males who hadn't participated in the rebellion). Voters would elect conventions to prepare new state constitutions, which had to include black suffrage. State governments could be elected once voters had ratified the new constitutions—and the state legislature had to ratify the Fourteenth Amendment. Then the state could be readmitted into the Union.

By 1870, all states had been readmitted.

Thus black suffrage arrived—though only in the South for now. The Fifteenth Amendment (1870) made it nationwide.

Quite radical—interracial democracy!—but not enough. Freedmen's economic conditions weren't changed, and no new agencies were created to protect black rights. (That came only in the 1960s.) Republicans never embraced the issue of land redistribution, since it was opposed by business.

Reconstruction Act triggered a new outburst of black political activity and resistance to segregation. More mass meetings, and a deluge of freedmen into the Union League for political education. It catapulted many ex-slaves into political leadership in their states, hundreds becoming state legislators in the following years. Throughout Reconstruction blacks remained infatuated with politics, running for elections and voting at rates of 90 percent. The Republican party became as central to the black community as the church and the school.

Carpetbaggers and scalawags (Southern-born white Republicans). The former got a major share of Reconstruction offices, but the latter (hated, often called "white negroes") were surprisingly abundant in some states. 25 percent or more. Some were poor white farmers who allied with blacks against the planter class, which they hated partly because it had been mainly responsible for wartime devastation. Often favored confiscation. So, the beginnings of real class struggle, revolutionary attitudes. But moderate white Republicans prevented these buds from blossoming into something bigger.

A remarkable time. Blacks served as mayors, aldermen, on city and town councils, on juries, as sheriffs, police chiefs, county supervisors, justices of the peace, etc. (Were always a minority, though. White Republicans had more power.) Vagrancy laws couldn't be used to force freedmen to sign labor contracts because Republican politicians owed their power to "the vagrant vote."

Expansion of the public sphere. Reconstruction governments were activist: established public schools, hospitals, asylums for orphans and the insane; expanded property rights for married women, widened grounds for divorce, and so on. Couldn't raise taxes enough to build a truly modern system of public education, but the achievements were significant. (4,000 schools by 1870, staffed by 9,000 teachers—half of them black. By 1876, more than half of all white children and 40 percent of black children were attending (segregated) schools in the South.)

In the early 1870s some states even outlawed segregation in certain private businesses, like railroads and hotels. But hard to enforce.

Impressive legislation to protect workers and poor white farmers. States outlawed corporal punishment, limited capital offenses, reduced penalties for theft, passed debtor relief laws, raised property taxes on the rich, abolished property qualifications for holding office.

Major priority was economic development. Development has always required extreme state intervention (tariffs, subsidies, tax incentives, eminent domain, appropriating money for infrastructure projects, government investment in science and technology, etc.). Conservative ideas of the pure free market are a myth. So Republicans used state policy to attract railroad and industrial companies, e.g. by exempting them from taxes. (Still going on today!)

But the program of state-sponsored capitalist development ultimately did much to bring down the Republican party and Reconstruction itself. Produced huge state debts, high taxes, and drained resources from schools and other programs. As state debts increased and the value of state bonds declined, credit collapsed. At the same time, all this aid to railroads created the conditions for widespread corruption, which undermined the political legitimacy of Republican governments. Bribery, fraud, plunder, conflicts of interest. U.S. was full of corruption at this time, but it got more attention in the South because of Reconstruction's enemies. Nor did it help that the promised economic revolution didn't happen: Northern and European investors were wary of sending their money to a region with so much political uncertainty.

No real modernization. But there were economic changes. Railroads made possible commercialization of the upcountry, where poor white farmers started growing cotton. Integrated into the market. Led to debt and dependency. Eric Foner: "Because of the region's chronic capital shortage and scarcity of banking institutions, local merchants generally represented the only source of available credit. With land values having plummeted, merchants would usually advance loans only in exchange for a lien [claim] on the year's cotton crop, rather than take a mortgage on real estate, as was conventional in the North. The emergence of the crop lien as the South's major form of agricultural credit forced indebted farmers to concentrate on cotton [which could be sold easily], further expanding production and depressing prices." Thousands of indebted white farmers had to become agricultural laborers and sharecroppers—especially because of the depression of the 1870s.

Bad not only for them but also Reconstruction itself: they blamed Republicans for bringing market relations into the upcountry (because of railroad promotion), and also hated the party for its high taxes. Gave political ammunition to the Democrats.

Freedmen fared a little better. Had more power than before, greater freedom to leave and seek better employment conditions, often higher wages (because planters wanted to entice them to work for them). Could work on railroads, for instance. Planters complained their workers were "unruly, insolent, and disobedient." Couldn't control them easily, partly because of the nature of sharecropping.

Nevertheless, like independent white farmers, black sharecroppers eventually grew more and more indebted, especially during the depression. Couldn't escape debt to the local merchant. Lost self-sufficiency in food because they had to produce cotton for the market in order to pay the merchant. (Progress of capitalism.) In the long run became like debt peons.

*

Andrew Johnson did what he could to undermine Congressional Reconstruction, but he was basically a lame-duck president. The Radicals' attempt to oust him failed, but he had little power left anyway. Grant was elected in 1868.

Meanwhile, all this change provoked violent opposition. Had actually been going on since 1865. Mass murders, lynchings, and beatings by former masters on any pretext—although blacks counterattacked quite rarely. Got even worse later. Ku Klux Klan founded in 1866 as a Tennessee social club, but expanded to spread a “reign of terror” against Republican leaders black and white. Blocked blacks from voting. The KKK was basically a military force serving the interests of the Democratic party, the planter class, and white supremacy. Aimed to destroy the Republican party and restore control over the black labor force. Black churches and schools were burned; white and black politicians killed; economically successful blacks were killed, and laborers who weren’t sufficiently obsequious toward their white employers. The Klan’s leadership included planters, merchants, lawyers, and ministers. Respectable citizens, not just white trash. State governments in most cases couldn’t or didn’t want to suppress the violence.

By 1870, Northern Republicans were starting to lose interest in Reconstruction. Many thought the Fifteenth Amendment was the culmination and they should turn their attention to other matters. But as before, Southern violence and recalcitrance pushed them onwards to greater radicalism. The Ku Klux Klan Act of April 1871 for the first time designated certain crimes committed by individuals as punishable under *federal* law. “Conspiracies to deprive citizens of the right to vote, hold office, serve on juries, and enjoy the equal protection of the laws, could now, if states failed to act effectively against them, be prosecuted by federal district attorneys, and even lead to military intervention and the suspension of the writ of habeas corpus.” A truly modern act, anticipating the Civil Rights Era. Major expansion of the central government—in principle.

Thousands of Klansmen were indicted, and many went to prison. Federal troops occupied parts of South Carolina. By 1872 the KKK was broken and violence had dramatically declined.

But Reconstruction was about to end anyway. Many reasons. Underlying condition was Republican factionalism: moderates, conservatives, fewer radicals by now. Moderates and conservatives connected to Northern finance wanted return to gold standard because deflation is good for creditors. But gold standard and Radical Reconstruction were incompatible. (Huge state, high government expenditures, budget deficits = greenback system, not gold.) Nor did they want high taxes. Also, any major empowerment of blacks in the South would mean empowerment of workers, which business was and is opposed to. And feared it might spread to the North.

Various different Republican constituencies across the country had their own interests and ideas. Conflicts over tariff, civil service reform (because of corruption), internal improvements in other regions (not the South), currency issues; the Southern Republicans were only one faction, and not very powerful.

But it was the 1870s depression that provided the context. Enormous class conflict. “Respectable” public opinion shifted right, to the necessity of protecting property and opposing democracy and activist government. For Republicans, “economic respectability” began to replace equality of rights for black citizens as the essence of their self-image. Beginning of the shift to conservatism.

Meanwhile, because of the depression, voters handed Democrats an electoral triumph in 1874. More Democrats came to power in the South. Downsized government partly because of states’ devastated budgets and tax rolls (from the depression). The depression dramatically worsened the situation of black workers. And a resurgence of violence against blacks—not KKK, not masked and hooded, but open and savage. State and federal governments did little to oppose it. In 1877 Hayes took office in return for an end to Reconstruction. (Federal troops withdrew.)

The “Redeemers” had triumphed. As a black man said, “The whole South—every state in the South—has got into the hands of the very men that held us as slaves.” For the rest of the century, Democratic governments reshaped the constitutional and legal system so as to control labor and subordinate blacks.

Taxes on the poor were increased, those on the rich decreased. State budgets were slashed: money for schools, public hospitals, “welfare” for the blind and disabled, etc. was drastically cut. Said one planter: “What I want here is Negroes who can make cotton, and they don’t need education to help them make cotton.”

The Republican party collapsed in the Deep South, because of racism, violence, and electoral fraud. Poll taxes and literacy requirements for voting (especially starting in 1890s). The region became a bastion of the Democratic party—until the 1960s and ’70s, when it became mostly Republican.

Rise of Jim Crow regime. Supreme Court’s decisions in 1883: 14th Amendment prohibits states from discriminating, but not individuals or private organizations. Then *Plessy v. Ferguson*: “separate but equal.” (Segregated seating on railroads.) Legitimized the system of racial hierarchy and segregation. Also dramatic increase of violence against blacks in the 1890s. Lynching events were sometimes like festivals, hundreds of white families watching, sending postcards about it, taking pieces of the dead bodies as souvenirs. In 1899, a plantation laborer who had killed his employer in self-defense was lynched before a crowd of 2,000 (including children). Executioners cut off his ears, fingers, and genitals and burned him alive, and then the crowd fought over pieces of his bones. No attempts to bring the perpetrators to justice.

All this was basically to control the black labor force: it was useful to the ruling class, useful for profits. Racist propaganda was also useful for dividing poor whites against blacks and so preventing a *class*-based political movement from challenging planters’ and businessmen’s power. (Populism had only minor success in building such a movement.)

Most “respectable” jobs were closed to blacks, though a small black middle class did emerge. Women were confined mainly to work as domestic servants, not secretaries or store clerks.

Moves toward a Southern industrial revolution. Textile manufacturing, iron industry, steel industry, mining, railroads. Northern capital came because of low wages and availability of convict labor. “Slavery by another name” (Douglas Blackmon book). Vagrants—the unemployed—could be arrested; so could black men who looked at a white woman the wrong way, or were “insolent,” etc. Criminalization of black life. Similar to Black Codes, but worse. Some men were sent to prisons and then leased out to employers; others only had to pay fines, but because they couldn’t afford them they were given to employers who paid the fine in return for using them as forced labor. Tens of thousands of convicts became industrial slaves. Were repeatedly bought and sold; stayed in the possession of companies for years. Company guards could chain them,¹ shoot them if they tried to flee, torture them, whip them almost without limit. Mortality rates as high as 50 percent or more. Miserable living conditions in labor camps and some company towns. Starvation, disease, very little medical treatment—and no legal accountability for vicious treatment of the slaves. (p. 218)

The industrialization of the South was in fact a product, in large part, of slave labor. Industrialists, bankers, politicians, planters all profited from slave labor (convict labor)—all the way up to World War II. (Today, similarly, corporations like Apple profit from sweatshops around the world. Capitalism and the modern world were/are made possible by forced labor, colonial conquests, genocides, and the cheapening of labor to the lowest possible point. (One of the purposes of this course is to learn about the dark side of capitalism.))

Incidentally, there’s been a similar criminalization of black life since the 1970s. Possession by blacks of marijuana or crack cocaine (in the 1980s) or other drugs sent them to prison—even though it’s a victimless

¹ But strictly speaking it wasn’t chain gangs. Those emerged in the early 20th century, around tasks like road construction, ditch digging, and farming. Chain gangs were usually more humane than the older convict leasing, and by the 1920s or earlier they were more common.

crime. The opioid epidemic now is a largely white phenomenon, so it isn't seen as *criminal* but as a *health crisis*. Blatantly racist double standards.

Anyway... Partly because of workers' inability to unionize and raise their wages, the South remained a primitive, semi-colonial region that couldn't develop as the North did. A large middle class couldn't develop. But the South's impoverished agrarianism was also responsible for this. (Only the federal government's intervention later on finally brought the South to a "civilized" condition.)

In short, between the end of Reconstruction and World War II, Southern blacks were trapped in a framework of systematic terrorization and control. Couldn't escape it without outside help. So conservative philosophies arose like Booker T. Washington's: be a self-made man, get a vocational education, learn skills in the trades and agriculture, don't challenge the system or agitate for political or economic rights. Refine your speech, improve how you dress, adopt the standards of the white middle class. An *individualistic* philosophy. (Very different from W. E. B. DuBois'.)

Reading *Our Magnificent Bastard Tongue: The Untold History of English* (2008), by John McWhorten. Good book. Also some random long essays. For instance "Getting Real with Rouse and Heidegger," by Jeff Kohan (2011), which is about my old Wesleyan professor Joe Rouse's philosophy of science and his interpretation of Heidegger, and "Bourdieu's Class Theory" and "The New Durkheim: Bourdieu and the State," both by Dylan Riley.

One reason I like to periodically return to contemporary philosophy is to remind myself I'm not missing much. Rouse, Kohan, and Heidegger are confused. For instance, according to Kohan,

Rouse's claim that the world is constituted by practices, equipment, and social roles seems to pose a direct challenge to realism. For, if our practices play a fundamental role in the constitution of the world, then the realist's basic conviction that at least some entities must exist independently of our involvement with them appears hopeless. Indeed, Rouse's position would seem to have more in common with such antirealist doctrines as constructivism than it does with realism... Yet Rouse cautions that his own rejection of [empiricism] should not be mistaken for an endorsement of constructivism. According to him, the central claim of constructivism is that observation is theory laden. In other words, like Rouse, constructivists reject the [empiricist] notion of a pure [non-theory-laden] observation language, but, unlike Rouse, they do so because they believe that our only access to the world is through theory-laden observation. In fact, Rouse points out that the challenge posed by his practical hermeneutics to theoretical hermeneutics is equally effective against constructivism. With a nod towards Ian Hacking (1983), he argues that scientific research practices have "a life of their own" independent of theory and may thus yield interpretations of the world importantly different from ones laden by theory. Moreover, Rouse emphasises that, because practical hermeneutics puts the weight on practice rather than on theory, it does not point towards the "apparently idealist implications of constructivism."

Confusions. First of all, sure, our practices play a fundamental role in the constitution of the world—of *our* world, the world we experience. The world *as we experience it*. But that's just a truism, not some deep philosophically interesting insight. The world *as it is in itself*, prior to human experience of it, by definition *isn't* constituted by our practices and social roles and so on. It's constituted by whatever the independently existing essence of the world is. These Heideggerian types always think that somehow they're dissolving the realism/idealism debate—and the subject/object distinction, etc.—just by providing a phenomenological description of our experience (how we experience the world and what is implicit in our

experience). “Being-in-the-world” and so on. But that’s stupid. Everything they say applies only to *our experience, our human world*. What *science* wants to get at, on the other hand—at least the hard sciences—is the essence of the world *prior to how we experience it*.

I don’t understand how these simple confusions are possible.

At the end of the paragraph Rouse refers to the “apparently idealist implications of constructivism.” But I see nothing idealist about the definition of constructivism given above. Whether observation is “theory-laden”—in a broad sense of theory, as having to do with values, presuppositions, cognitive interests, and the deep unconscious cognitive structuring of experience that the brain carries out—has nothing to do with idealism. We simply use our theory-laden observations to help construct and support hypotheses about how the world is in its essence.

Continuing his project of rejecting common sense, Rouse then tries to undermine realism by, first, criticizing the correspondence theory of truth. He prefers a deflationary account of truth:

As Rouse writes, the deflationist insists that all we need to know about truth is contained in the Tarski sentence “‘Snow is white’ is true iff snow is white.” In other words, anything that can be said using the predicate “is true” can be said just as well without using that predicate. Hence, to say that “‘p’ is true” is the same as saying more simply that “p.” From this it follows that truth predicates do not introduce any new facts about the sentence in question. As a consequence, the deflationist claims that we can get along without a theory of truth, because, as Rouse puts it, “[t]ruth plays no explanatory role.” In this way, the deflationary account undercuts the metaphysical doctrine of correspondence.

Um, yes, propositions posit their own truth. So, sure, it’s somewhat redundant to say that “‘p’ is true.” You might as well just say that “p.” But I don’t see how that invalidates the correspondence theory of truth. It remains the case that “Snow is white” is true if and only if *snow is white*. The proposition has to *correspond to a reality* in order to be true. As I wrote in my senior thesis, the fact that propositions *represent a state of affairs* already entails the correspondence theory of truth, because it’s the *state of affairs* that is at issue, that determines whether the proposition is true or false.

More silliness:

...Rouse moves still closer to realism in urging that the existence of electrons and positrons is genuinely theory-independent. Indeed, he firmly endorses Hacking’s famous argument for realism. Responding to the successful manipulation of sub-atomic particles in the laboratory, Hacking writes: “*So far as I’m concerned, if you can spray them then they are real.*” Spraying subatomic particles is not an act of theory; it is a practical act. Rouse argues that, insofar as practical action proves the existence of these entities, a proof has been given independently of theory. However, he also presses the point that such proof has *not* also been given independently of practice. Hence, citing the core realist doctrine that entities can exist independently of our theories and practices, Rouse insists that his practical hermeneutics can no more be counted a form of realism than it can a form of antirealism.

...I have shown that Rouse’s hermeneutical solution to the shared confusion of realism and antirealism includes an assimilation of existence to meaning. Following what he takes to be the pragmatism of *Being and Time*, Rouse construes entities *as such* in terms of equipment and argues that any specific item of equipment can only be what it is within an overall equipmental totality. Heidegger describes this equipmental totality as constituting the structure of the world. Only through their disclosure within the practical structure of an equipmental world do entities have meaning, which for Rouse means that only then can they exist. According to Rouse, we can never get at the real as something which exists independently of our interpretations.

Wow. First, it amuses me that Hacking's argument for realism given above (in the italicized sentence) is famous. As I wrote years ago when puzzling over how G. E. Moore's argument against idealism ("Look, I have hands!") could have become so famous, "that fact in itself strips philosophers of whatever dignity they thought they had." How stupid must people be to be impressed by Hacking's painfully obvious 'argument' for realism??

But after "firmly endorsing" Hacking's argument for realism, Rouse apparently...rejects realism. The proof of subatomic particles hasn't been given independently of practice, so...it doesn't provide an argument for realism. So Rouse doesn't endorse Hacking's argument after all. Instead, he thinks that what it is for something to exist is for it to be...disclosed in an equipmental world. Okay. Brilliant. So we're back to a kind of idealism (entities can't exist independently of us, of our practices or minds or theories or ideas or whatever version you like). Maybe Kohan is caricaturing his position, but *someone* here has to rethink things.

There's some truth in the last sentence, though: we'll never really "get at the real" as it is independent of human consciousness and experience (or practices, or however you want to frame it). By definition. That doesn't mean it doesn't exist, though.

Rouse: "[W]hat exists depends upon the field of meaningful interaction and interpretation within which things can be encountered." He forgot to insert the key words *for us.* What exists *for us* depends upon, etc. But that claim is an uninteresting truism.

Later, an amusing statement from Kohan: "As Rouse has so ably argued over so many years, the objects of science are meaningful because scientific research is a way of being-in-the-world. The world of science is configured by regimes of practice, and it is only within this practical context that the objects of science have meaning." Wow, remarkable insights. And so philosophically fecund. Scientific research is situated within practical contexts and has meaning within those contexts. Who would have thought. –Ugh, phenomenology. When it comes to the analysis of self and of relationships, I think phenomenology is of value; but it can easily become of virtually nugatory intellectual interest if indulged in for its own sake, so to speak, to analyze all our practices and claim that deep insights are achieved thereby.

Of more interest is something like Stephen Stich's article "Between Chomskian Rationalism and Popperian Empiricism" (1979). Tries to find a middle way between "rigid rationalism" and empiricism, but I think fails. How could there be such a middle way? Either the mind comes innately equipped with a rich cognitive structure that determines constraints on, for instance, the set of possible grammars a person can "learn," or it doesn't. All the dazzling and somewhat confusing legerdemain of a contemporary philosopher like Stich can't get around that basic intuition.

But getting back to the pragmatism of Rouse and kin, such as Robert Brandom and Richard Rorty (and the earlier classical thinkers), I'm not sure what to make of it. Sometimes, as in the case of Rorty, it's just hopeless. But in general I never feel as though I can do much with it or be very stimulated by it. Interpreting humans and ideas like truth, meaning, rationality, science, etc. in terms of practice, action, behavior, experience, intersubjectivity, "being-in-the-world," sociality, etc. To take an example from Robert Brandom (quoted in Steven Levine, "Brandom's Pragmatism" (2012)):

For the pragmatists, experience is not an input to the learning process. It just *is* learning: the process of perception and performance, followed by perception and assessment of the results of the performance, and then further performance, exhibiting the iterative, adaptive, conditional-branching structure of a test-operate-test-exit loop. The result of experience is not best thought of as the possession of items of *knowledge*, but as a kind of practical *understanding*, a kind of adaptive attunement to the environment, the development of habits apt for successful coping with the contingencies.

It's like, sure, you can interpret it all in this way if you want. There's some truth to it, it can be reasonable enough, it can serve as a reminder that some sort of vulgar Cartesianism is one-sided. But in the end, I don't really see the point of it all. Reinterpreting everything in a certain way... Yeah, all this is one way to look at it. But it, too, of course is one-sided, and can be downright misleading and wrong insofar as it has

behaviorist and empiricist tendencies. It also seems shallow and not very *explanatory*, as cognitive science is.

“What Brandom thinks is most salient about pragmatism, in all of its guises, is a claim about the ‘priority of the practical’, the view that explicit beliefs and representations depend on and are somehow emergent from a background of implicit practical abilities. Here, pragmatism is seen as most opposed to an intellectualism [e.g., Chomsky’s] in which our ability to think and act is underwritten by an ability to explicitly grasp and apply rules or principles.” Okay, so pragmatism is opposed to cognitive science. [Unless “explicitly” here means *consciously*.] Good luck with that.

Anyway, I’m not particularly interested in alternative conceptualizations for their own sake (like pragmatism). I’m more interested in *learning* things, as through science, or in resolving deep philosophical puzzles—which I don’t think pragmatism does, despite its pretensions to do so.

Reading/skimming a bunch of JSTOR articles in the philosophy of language, cognitive science, phenomenology, the philosophy of biology, etc. The papers by and about H. P. Grice aren’t exactly easy to read. Nor are those by Wilfrid Sellars. But Laurence Bonjour’s 1969 Ph.D. dissertation on “Knowledge, Justification, and Truth: A Sellarsian Approach to Epistemology” is excellent. In the last chapter he summarizes some of the modern objections to the correspondence theory of truth:

As is so often the case with pronouncements of (sophisticated) common sense, it is most difficult to see how the correspondence theory can fail to be correct. [Yes!] But, as is also so often the case, there are problems with such a view of truth which have proved to be extremely resistant to solution. These problems arise as soon as one tries to say anything very specific about either the relation of the supposed relation of correspondence, or about the nature of the relation itself. To take the latter first, there has always been a great temptation to regard the relation of correspondence as involving somehow a fitting together or congruence of belief and fact, where such a congruence is to be understood as involving more than a merely conventional correlation. This sort of inclination is, I think, one motive behind familiar image theories of thought, characteristic especially of the British Empiricists. But every attempt to go beyond the metaphor of congruence or fitting together and give a precise characterization of such a relation runs aground on the hard fact that, once the sorts of confusion present in the image theory have been eliminated, there simply does not seem to be any clear sense in which beliefs or the sentences which express them are non-conventionally related to the world which they describe. And thus we are apparently left with a purely conventional correlation as the only explication of what is meant by “correspondence,” with the disheartening result that the correspondence theory seems to say nothing more than that a belief is true if it is conventionally correlated with the world in the right way, i.e. if it is true. And these already formidable difficulties with the correspondence theory are aggravated by problems about the nature of the relation of correspondence. E.g., is the first relatum a belief? A proposition? A statement? And what is the second relatum? A fact? But which fact? How many facts are there? I shall not pursue these issues, nor attempt here any further account of the modern tribulations of the correspondence theory, but shall simply assume that all attempts to state a traditional correspondence theory have failed. Such a view seems to represent the consensus of contemporary opinion, though there are doubtless still some who would demur.

Yes, I would demur! First of all, it’s simply inadmissible to reject something so overwhelmingly intuitively obvious as the correspondence theory of truth. I realize contemporary philosophers care more about verbal disputes than intuitions, but still, there should be a limit to their rejection of intuitions. Secondly, the mere fact that it might be difficult to characterize the nature of the correspondence in question doesn’t justify casting aside the whole “theory” itself (not really a *theory* but just a massively compelling intuition). There are all sorts of intuitions and ‘understandings’ we have that we don’t have a great account of, but we don’t simply abandon them because of that. (For instance, we don’t really understand our sense of self or the

inner sense of free will, but we don't thereby reject the notion that we have a sense of self and a sense of free will). That we can't *clarify* something doesn't mean it's *false* or should be abandoned. It's hard to clarify the nature of causation, but we still believe that causes and effects exist. Nor is the correspondence theory empty in the way BonJour suggests when he says it states nothing more than that a belief is true if it's correlated with the world in...the right way. When you're talking about something as fundamental to the structure of human cognition as the relation between thought and world—more specifically, how sentences are able to represent states of affairs—you shouldn't be surprised if it's hard to say something that seems really informative or substantive or 'new.'

But BonJour, a rationalist, has great respect for intuitions, and so is a perspicacious thinker. He proceeds to reconstruct something like a (Sellarsian) correspondence theory of truth in the rest of the chapter. Here's another example of his perspicacity, on a subject I've addressed a number of times in the journal:

One point at which the picturing aspect of empirical truth [which is his, and Sellars', version of the correspondence theory] becomes extremely critical is in connection with the familiar realist/instrumentalist dispute over the status of theoretical entities. The realist characteristically asserts that theoretical entities are real in whatever sense ordinary physical objects are real, and hence that true theoretical statements genuinely describe the "furniture of the world." The instrumentalist wants to deny this, and claims instead that talk about theoretical entities is only an "instrument" or a "calculational device" for making predictions about ordinary observable entities. There are, I think, serious confusions implicit in the instrumentalist notion of observation... But if no reference is made to the picturing dimension of empirical truth, it is hard to avoid the conclusion that the basic issue upon which realists and instrumentalists appear to disagree is a *Scheinstreit*. Both camps agree that a true theory will be part of the most coherent total scientific account. Both agree that such a theory is true in the semantic [Tarskian] sense. Both can agree that such a theory is a useful instrument for making predictions about the sorts of phenomena which the instrumentalist wants to call observational. But in spite of these agreements, the realist still wants to say that such a theory genuinely describes the world in the strongest possible sense, while the instrumentalist wants to deny this. But does this difference really amount to anything? Can the point at issue even be clearly stated?

It is most tempting at this point to conclude that the instrumentalist/realist issue really is a pseudo-issue, and many eminent philosophers have yielded to this temptation. It seems to me, however, that this move is intuitively so implausible that it should be resisted at almost any cost. Intuitively the difference between atoms and protons really existing "out there" in the same sense in which houses and apples do, on the one hand, and it merely being useful to talk of atoms and protons in order to make predictions about houses and apples and somewhat more esoteric objects of the same sort, on the other, is simply as enormous as can be imagined. It would seem that any philosophy which is forced to declare an intuitive difference of this magnitude to be illusory is in extreme danger of having implicitly declared itself to be illusory.

Yup. It has never ceased to amaze me that "many eminent philosophers" have been (for example in the days of logical positivism) able to believe that the debate between realism and this idealist instrumentalism isn't substantive!

More interesting than the typical philosophical rejection of utterly obvious common sense is the Sellarsian notion of the Myth of the Given. —I have to say, incidentally, that the more I read about and by him, the more Sellars impresses me. He's both provocative and, it seems, sensible (not in every particular but on the whole). And I can't but respect his systematic vision. He was someone who actually deserved the august title "philosopher." I like this quotation of his:

The aim of philosophy, abstractly formulated, is to understand how things in the broadest possible sense of the term hang together in the broadest possible sense of the term. Under “things in the broadest possible sense” I include such radically different items as not only “cabbages and kings,” but numbers and duties, possibilities and finger snaps, aesthetic experience and death. To achieve success in Philosophy would be, to use a contemporary turn of phrase, to “know one's way around” with respect to all these things, not in that unreflective way in which the centipede of the story knew its way around before it faced the question, “how do I walk?”, but in that reflective way which means that no intellectual holds are barred.

In light of his importance, it isn't surprising few or none of my philosophy professors ever mentioned him. I knew of him, but for some reason I didn't seek him out.

[Incidentally, Chomsky's definition of philosophy is, characteristically, pithier: philosophy seeks to answer the question “What are we up to?”]

I'm having a hard time getting clear on all the issues and implications involved in the (rejection of the) Myth of the Given. The subject gets quite complicated, and even somewhat elusive, as you delve further into it. But I suppose once you abstract away from all the abstrusities it's not so difficult. In one of its dimensions, at least, it's an epistemological issue, a question of “how the structure of propositional knowledge and belief relates to the world which it is about” (to quote BonJour). According to a certain philosophical tradition, the Given is supposed to infallibly ground our knowledge. It's what we're ‘*immediately*’ (and thus non-conceptually) aware of, what is indubitably certain in, e.g., our sense-perceptions.¹ It's usually thought of as qualia or sense-data (but has also been thought of as certain self-evident principles, such as Descartes' causal principle in the *Third Meditations*).

This is from the *Stanford Encyclopedia of Philosophy* article on pragmatism:

The established view [from Cartesianism, both rationalist and empiricist] linked experience to what is sometimes called ‘the given’: we are the passive recipients of atomistic, determinate and singular sensory contents, the kinds of things that are sometimes called sense data. Experience provides the material for knowledge and conceptualization, but it does not itself have a content that is informed by concepts, practical needs, or anything else non-sensory. Our only contact with the external world is through receiving such experiences that, we suppose, are caused by external things; but since these sensory inputs are our only source of knowledge of the external world, we have no direct sensory awareness of external things...

Much of this, of course, is wrong, as Sellars argued. Our sense experience is already interpreted the instant we have it, unconsciously interpreted through the brain's synthesis of stimuli into a coherent manifold of enduring objects. (I'm not necessarily attributing this reasoning to Sellars.) This is both causal and epistemological mediation; there is no truly “immediate” sense-datum or quale. In a sense, yes, we are “noninferentially” aware that, e.g., there's a brown tree in front of me: *for consciousness*, the tree is just immediately given, we don't “infer” that it's there or it's brown. But the fact that the experience is propositionally structured or capable of being expressed in propositional form—if we have a language we can say, “The tree is brown” or “I see what appears to be a brown tree,” and even if we don't have a language we're aware of the object with leaves on it and its color (an awareness that can in principle be expressed propositionally)—shows that on some level there have to have already been inferences from the non-propositionally-structured stimuli the brain/mind receives to the “interpretation” of a brown and green enduring object that's relevantly similar to other brown and green objects, etc. To say this sense experience is necessarily *conceptual*, as some opponents of the “Given” do, seems ambiguous insofar as the possession

¹ It doesn't seem that it *has* to be indubitable or incorrigible, but it was usually thought of that way.

of “concepts” (depending on what you mean by concepts) might seem to presuppose the possession of language, whereas surely people can be aware of trees and so on—not *calling* them trees but aware that trees as such differ from flowers, houses, and other categories of things—without having a language.¹ I’d rather say the sense experience is necessarily *cognitive*, located in “logical [or inferential] space,” informed and structured by elements decidedly “non-sensory.”

But no, on second thought, sure, you might as well say the sense experience is conceptual, even before or absent the acquisition of language. The person might not be able to *name* the conceptual objects he’s confronted with, or have a fully-worked-out understanding of them, but they’re essentially conceptual nonetheless. While I’m deplorably ignorant of cognitive developmental psychology, I’m fairly certain its findings (would have to) accord with my intuitions. I’ll peruse some articles shortly.

As for the question posed by the last sentence of the quoted passage, whether we have direct awareness of external things, in a sense the answer is obviously no: our awareness is causally mediated, not “direct,” whatever that would mean. But as for what the objects of our awareness are, they can be considered *either* external objects *or* ‘internal’ sense-perceptions. The latter alternative should be pretty uncontroversial: insofar as we have sensory experiences, the experiences are *for* (or *apprehended by*) *consciousness*, which means that in a sense they’re ‘in’ consciousness, or are *sense-perceptions*. This desk, as I experience it, is a ‘perception’ present to my consciousness; and *as* a perception, it isn’t an *external* thing. On the other hand, inasmuch as the scientific account of perception makes reference to such external things as photons and a myriad of other particles and waves, the ‘image’ (or auditory experience, etc.) the brain constructs is clearly of external phenomena that have impinged on the nervous system. So in this sense we *are* aware of external things. But only indirectly.

In their book *Knowledge, Mind, and the Given: Reading Wilfrid Sellars’s “Empiricism and the Philosophy of Mind”* (2000), William deVries and Timm Triplett write, “What is crucial to Sellars’s idea of the given... is that the given does epistemological work: What is given not only exists as some sort of element of a person’s experience but also must serve the very specific epistemological role of being the epistemically independent basis that epistemically supports all other justified or known empirical propositions for a person. [Epistemic independence means that its positive epistemic status doesn’t derive from some other proposition or epistemic state.] This idea explains why certainty is not an essential trait of the given. What is essential is its alleged capacity to justify without itself requiring justification.”

¹ Thus I’m skeptical of Sellars’ “psychological nominalism,” according to which “*all* awareness of *sorts*, *resemblances*, *facts*, etc., in short all awareness of abstract entities—indeed, all awareness even of particulars—is a linguistic affair.” As John McDowell elaborates in “Sellars and the Space of Reasons,” “We tend to picture a child, learning its first language, as already at home in ‘a logical space of particulars, universals, facts, etc.’ On this picture learning a language can be a matter of simply associating words and phrases with these already available objects of awareness. Against this, Sellars’s psychological nominalism denies ‘that there is any awareness of logical space prior to, or independent of, the acquisition of a language.’ So knowledge, in a sense that implies awareness of ‘logical space,’ can be enjoyed only by subjects who are competent in a language.” When I read such *a priori* armchair speculations on substantive issues of psychology I hear Chomsky’s rebukes of philosophers for their “methodological dualism”: respecting the scientific method only with regard to finding things out about the *body* (about how sight works, digestion, etc.), ignoring it when it comes to the *mind* (which of course is really just an affair of the body, specifically of the brain). You have to conduct a lot of subtle experiments before you can affirm or deny something like psychological nominalism. Intuitively, though, I’m inclined to be skeptical of it. I’m encouraged in my skepticism by Chomsky’s remark in *New Horizons in the Study of Language and Mind* (and elsewhere) that “at peak periods of language acquisition, children are acquiring (‘learning’) many words a day, perhaps a dozen or more, meaning that they are acquiring words on very few exposures, even just one. This would appear to indicate that the concepts are already available, with much or all of their intricacy and structure predetermined, and that the child’s task is to assign labels to concepts, as might be done with limited evidence given sufficiently rich innate structure” (p. 61). It’s significant in this connection that the meaning of even simple concepts like house or book comprises a puzzling and paradoxical hodgepodge of abstract and concrete properties that no one is ever explicitly *taught*, if only because no one is even consciously aware of all these properties (all the hidden shades of meaning of a given concept). We must be born equipped in some unconscious way with a vast fund of conceptual knowledge, knowledge that is drawn out and filled out as experience proceeds.

“...One of Sellars’s major points about the origin of the doctrine of the given is that it is precisely because classical empiricists have *confused* sensing with conceptual states that they have failed to see the incoherence in the doctrine of the given.” For Sellars, sensing is not conceptual. A sensory experience is an object or event, like an apple or a thunderbolt, not a judgment. And so “sensory experiences cannot serve as premises or reasons in an argument, any more than an apple or a thunderbolt could. They are the wrong sorts of things.” They can’t transmit positive epistemic status (justification), so they can’t play the role that givenists require them to. So the given is a myth. (His argument, though, can be generalized so it’s not only limited to sensory experiences.)

To which I reply: first, it’s certainly true that you can’t get the conceptual framework of (or for) experience *from experience*. You have to bring it *to* experience, as rationalists understood. In this sense, mere sensing is not conceiving. Kant was right about that. So on this level, Sellars’s argument tells against only empiricism, not rationalism. I’d argue, though, that after infants reach the age of, say, five months (or maybe less), their sensory experiences do start to be, in a sense, conceptually structured, in that they begin to perceive *kinds* of things. But anyway, Sellars’s conclusion still follows: even conceptualized sensory experiences aren’t just “given,” since they aren’t “epistemically independent.” They belong (or slowly begin to belong) to a rich conceptual and epistemic framework, and in any case, in order for them to justify further propositions, one has to add the premise that they’re *reliable*—a premise that can be argued about in a skeptical fashion, and that brings in other considerations. So a strict foundationalism is false. Thus, at least with regard to a theory of *justification*, it’s necessary to bring in elements of coherentism—as Sellars said.

Well, I was going to go into more depth on Sellars, but this book and his classic essay both bore me and confuse me, so forget it. I think there’s also a bit of confusion in both Sellars and his interpreters, and of course too much *a priori* philosophizing about things that are at least partially within the domain of cognitive psychology. (Sellars’s “Myth of Jones” discussion isn’t without interest, though.)

Reading a bunch of articles on cognitive development. A fascinating field.

Interesting: “Human infants who receive little touching grow more slowly [and] release less growth hormone... Throughout life, they show larger reactions to stress, are more prone to depression, and are vulnerable to deficits in cognitive functions commonly seen in depression or during stress. Touch plays a powerful role for human infants in promoting optimal development and in counteracting stressors. Massaging babies lowers their cortisol levels and helps them gain weight... Thus, besides ‘simple touch’ being able to calm our jitters and lift our spirits, the right kind of touch regularly enough early in life can improve cognitive development, brain development, bodily health throughout life, and gene expression.” (From “Contributions of Neuroscience to Our Understanding of Cognitive Development” (2008).)

From Jean Mandler’s article “A New Perspective on Cognitive Development in Infancy” (1990) it seems my guess about when concepts, in some primitive sense, *start* to develop in the infant (I said five months or so) was just about right. Piaget was wrong that there’s a prolonged stage of exclusively sensorimotor processing, in which thinking, or conceptualizing, is absent. (In fact, he was wrong about the whole stage theory itself (except in the truistic sense that cognition progressively grows more sophisticated and abstract), as well as about the purported sensorimotor foundation of thought. This idea has *some* merit, but as a general explanation of all thought it’s too empiricist (notwithstanding Piaget’s criticism of empiricism).) Experiments have shown that the rudiments of conceptual thinking and perceiving exist by, at the latest, six months. (I’d say earlier, actually. In all likelihood.) One possible origin of concepts is that they develop out of the young infant’s perceptual schemas,¹ perhaps from “a process by which one perception is actively compared to another and similarities or differences between them are noted.” More specifically,

¹ As Jerome Kagan defines it in his paper “In Defense of Qualitative Changes in Development” (2008), a schema is “a representation of the patterned perceptual features of an event... The young infant’s representation of a caretaker’s face is an obvious example. The primary features of schemata for visual events are spatial extent, shape, color, contrast, motion, symmetry, angularity, circularity, and density of contour.”

image schemas— notions derived from spatial structure, such as trajectory, up-down, container, part-whole, end-of-path, and link— form the foundation of the conceptualizing capacity. [Lakoff and Johnson] suggest that image schemas are derived from preconceptual perceptual structures, forming the core of many of our concepts of objects and events and of their metaphorical extensions to abstract realms. They demonstrate in great detail how many of our most complex concepts are grounded in such primitive notions. I would characterize image schemas as simplified redescrptions of sensorimotor schemas, noting that they seem to be reasonably within the capacity of infant conceptualization.

Eric Margolis and Stephen Laurence’s article “In Defense of Nativism” (2013) makes you seriously wonder how anyone could be perverse enough to oppose nativism (i.e., a kind of rationalism, all the Chomskian stuff about innateness, poverty of the stimulus, the modularity of the mind, etc.). Here’s an interesting piece of evidence:

One especially vivid type of poverty of the stimulus argument draws upon the results of isolation experiments. These are empirical studies in which, by design, the experimental subjects are removed from all stimuli that are related to a normally acquired trait. For example, Irenäus Eibl-Eibesfeldt showed that squirrels raised in isolation from other squirrels, and without any solid objects to handle, spontaneously engage in the stereotypical squirrel digging and burying behavior when eventually given nuts. Eibl-Eibesfeldt notes that, “the stereotypy of the movement becomes particularly obvious in captivity, where inexperienced animals will try to dig a hole in the solid floor of a room, where no hole can be dug. They perform all the movements already described, covering and patting the nut, even though there is no earth available.” Since the squirrels were kept apart from their conspecifics, they had no exposure to this stereotypical behavior prior to exhibiting it themselves—the stimulus was about as impoverished as can be. Reliable acquisition of such a complex and idiosyncratic behavior under these circumstances provides extremely good evidence against [the empiricist hypothesis of] a general-purpose learning mechanism [that’s supposed to explain the acquisition of all psychological traits, as opposed to the nativist hypothesis of specialized acquisition systems each operative in a different domain, whether that of language, numbers, music, object representation, facial recognition, etc.].

Are humans supposed to be *the only species* that isn’t “programmed” to exhibit specific types of behavior and acquire specific types of knowledge??

Apparently the name of that argument is “the argument from animals”: “The argument from animals is grounded in the firmly established fact that animals have a plethora of specialized learning systems... But *human beings are animals too*.” What’s true of other animals should be true of us. And, indeed, it is: just as other animals tend to be pretty stupid in many ways, human beings tend to be pretty stupid too, as shown by the fact that large numbers of them are empiricists.

Being sensible, the authors argue that some *concepts*, too, are, loosely speaking, innate. “Likely contenders include concepts associated with objects, causality, space, time, and number, concepts associated with goals, functions, agency, and meta-cognitive thinking, basic logical concepts, concepts associated with movement, direction, events, and manner of change, and concepts associated with predators, prey, food, danger, sex, kinship, status, dominance, norms, and morality.” Yes! I love bold statements like this, especially when they’re highly plausible.

From Alison Gopnik’s “The Post-Piaget Era” (1996): “Piaget’s thesis that there are broad-ranging, general stages of development seems increasingly implausible. Instead, cognitive development appears to be quite specific to particular domains of knowledge. Moreover, children consistently prove to have certain cognitive abilities at a much earlier age than Piaget proposed, at least in some domains. Also contra Piaget, even newborn infants have rich and abstract representations of some aspects of the world. Moreover, Piaget

underestimated the importance of social interaction and language in cognitive development. Finally, Piaget's account of assimilation and accommodation as the basic constructivist mechanisms now seems too vague." I'm skeptical of neo-Piagetian constructivism, such as "the theory theory," "the idea that cognitive development is the result of the same mechanisms that lead to theory change in science." Evidence, counterevidence, testing of the theory (or representation), the invention of auxiliary hypotheses, the construction of a new theory, etc. The child's brain is like a scientist revising theories in the light of evidence. In a sense, this must be true: children constantly ask questions, they interpret and try to understand the world, they learn to make inferences about what's going on in other people's heads, they revise their beliefs, and so on. In fact, humans continue to do this throughout life. Organized science is but a more sophisticated version of cognitive processes (of inquisitiveness, 'theory' formation, informal testing) we frequently engage in even without being reflectively aware of it. But there's at least one obvious difference between science, even folk science, and early cognitive maturation: the former is a highly conscious activity, while the latter takes place even before the young child is (self-)conscious at all or remotely capable of advanced conceptualizing. The infant's and toddler's brain *unconsciously* constructs representations of the world, not through conscious reflective processes but through utterly mysterious, natural, 'spontaneous' [to use a misleading word] perceptual-cognitive-neural processes that 'grow' unbelievably complex and ordered structures of vision, object perception, linguistic syntax and semantics, musical sensitivity, etc. Such processes of even *physical* brain-growth—neurons forming trillions of connections with one another so as eventually to build stable, coherent, and integrated representations of the world—appear to have virtually nothing in common with scientists' self-conscious construction of theories.¹

More plausible than the theory theory is Fodor's (nativist) modularity conception of the mind, or Chomsky's principles and parameters approach.

And then in Nora S. Newcombe's paper "The Nativist-Empiricist Controversy in the Context of Recent Research on Spatial and Quantitative Development" (2002), you have the claim that "the key question in the nativist-interactionist controversy is whether environmental interactions are or are not required to produce mature competence. Nativists believe that adaptation was ensured by highly specific built-in programs, whereas interactionists suggest that inborn abilities do not need to be highly specific because, for central areas of functioning, the environmental input required for adaptive development is overwhelmingly likely. Evidence favors the latter solution to the adaptational problem." Of course. You need *some* sort of interactions with the environment in order for capacities to mature in the way they're 'programmed' to do! I don't see how that contradicts nativism.

Reading articles on David Marr's theories of vision. Not very easy. But stimulating and plausible. (Three levels: computation, algorithm, implementation. I don't see how the whole computational-representational conception of the mind, at least on *some* interpretation, can fail to be true. In order for the human being to interact with the environment, the brain has to deal with various levels and types of representations, and it has to carry out complex computations on the raw data it receives, so as to work up the data into something usable. Mathematics is the language of nature; calculations (computations) are how

¹ In another paper, Gopnik observes that "to many philosophers the very idea that children could be employing the same learning mechanisms as scientists generates a reaction of shocked, even indignant, incredulity." She continues: "For some reason, I've found this initial reaction to be stronger in philosophers than in psychologists or, especially, practicing scientists, who seem to find the idea appealing and even complimentary." Hm. Maybe philosophers do, after all, tend to be relatively perceptive thinkers? Personally, I find it hard to fathom how someone could be so wrongheaded as to think that infants—whose brains are *forming!*—and scientists are using the very same learning mechanisms. [It's true that toddlers constantly form "hypotheses" about the structure of the language they're learning, for example, and have their hypotheses repeatedly corrected and developed further by experience, but this is all unconscious.] Incidentally, here's another example of stupidity: some of Chomsky's critics have objected that language is socially constructed, part of a rich social context, not an individual psychological phenomenon. Half a moment's reflection should have suggested to them that even if language does depend crucially on social interactions, it "nevertheless ultimately depends on individual cognitive processes in individual human minds," to quote Gopnik. The idea that Chomsky's "Cartesianism" forbids recognition of the central importance of *interactions with others* is, well, stunningly dumb.

the brain processes and interprets the nature it ‘receives’ through the senses. (E.g., in order for us to walk, the brain has to constantly calculate where external objects are in relation to the body.) Maybe I’m just irredeemably stupid, but I don’t see what real alternative there is to this picture. I have to admit I don’t have the foggiest idea of how neural activities could carry out calculations, or even what it means to say they do, but clearly they must. Actually, the whole thing is one big goddamn mess, and scientists/philosophers haven’t even got clear on the basics yet.)

Reading the Chomsky-recommended *Memory and the Computational Brain: Why Cognitive Science Will Transform Neuroscience* (2010), by C. R. Gallistel and Adam Philip King. A brilliant and illuminating book, though not light reading. “Our central claim...is that the function of the neurobiological memory mechanism is to carry information forward in time in a computationally accessible form.” They argue against the non-representational, associative theories of learning that go back centuries, and claim that contemporary neuroscience is handicapped by its fidelity to this tradition, particularly in its position that the physical basis of memory is synaptic plasticity (the ability of synapses to strengthen or weaken over time, in response to increases or decreases in their activity).

Another central claim: “There must be an addressable read/write memory mechanism in brains that encodes information received by the brain into symbols (write), locates the information received by the brain (addresses), and transports it to computational machinery that makes productive use of the information (reads).” An academic review of the book elaborates: “In short, living organisms are made in the image of a digital computer of the sort described by John von Neumann and envisioned by Alan Turing.” I’ve always been skeptical of the abundance of parallels that thinkers like to draw between brains and computers, but *some* of the parallels must be justified. (*Not*, however, the idea that computers are conscious. That’s just stupid.)

Wow, Claude Shannon, “the father of information theory,” was remarkably brilliant. In general, I’ve always been impressed by mathematicians, by the very idea of mathematicians; but Shannon was incredible. Finding a way to quantify *information!* It’s almost miraculous.

From the book:

This brings us to a brief consideration of how Shannon’s analysis applies to the brain. The essential point is that the brain is a receiver of signals that, under the proper conditions, convey to it information about the state of the world. The signals the brain receives are trains of action potentials propagating down sensory axons. Neurophysiologists call these action potentials spikes, because they look like spikes when viewed on an oscilloscope at relatively low temporal resolution. Spikes are analogous to electrical pulses that carry information within electronic systems. Sensory organs (eyes, ears, noses, tongues, and so on) and the sensory receptors embedded in them convert information-rich stimulus energy to spike trains. The stimuli that act directly on sensory receptors are called proximal stimuli. Examples are the photons absorbed by the rods and cones in the retina, the traveling waves in the basilar membrane of the cochlea, which bend the underlying hair cells, the molecules absorbed by the nasal mucosa, and so on. Proximal stimuli carry information about distal stimuli, sources out there in the world. The brain extracts this information from spike trains by processing them. This is to say that much of the signal contains data from which useful information must be determined. [But the signal also contains ‘noise’ that the brain somehow has to filter out.]

...The modern approach to a neurobiological understanding of sensory transduction and the streams of impulses thereby generated relies heavily on Shannon’s insights and their mathematical elaboration. In a few cases, it has been possible to get evidence regarding the code used by sensory neurons to transmit information to the brains of flies and frogs. The use of methods developed from Shannon’s foundations has made it possible to estimate how many bits are conveyed per spike and how many bits are conveyed by a single axon in one second. The answers have been truly revolutionary. A single spike

can convey as much as 7 bits of information and 300 bits per second can be transmitted on a single axon. [This is *fascinating*. And how were they able to estimate it at all?!]

Given our estimates above of how many bits on average are needed to convey English words when an efficient code is used (about 10 per word), a single axon could transmit 30 words per second to, for example, a speech center...

In short, “Understanding how the brain works requires an understanding of the rudiments of information theory, because what the brain deals with is information.”

“For decades, neuroscientists have debated the question whether neural communication is analog or digital or both, and whether it matters... Our hunch is that information transmission and processing in the brain is likewise ultimately digital. A guiding conviction of ours – by no means generally shared in the neuroscience community – is that brains do close to the best possible job with the problems they routinely solve, given the physical constraints on their operation. Doing the best possible job suggests doing it digitally, because that is the best solution to the ubiquitous problems of noise, efficiency of transmission, and precision control.” They make this observation because the modern theory of computation is cast entirely in digital terms (digital means information is carried by a set of discrete symbols, rather than something *continuously* variable), so in order for the theory to be relevant to the brain, the brain has to work digitally. Incidentally, the genetic coding of information is a digital, not an analog, system.

Sometimes I like to just sit in awe. The brain has to interpret the world in such a way that the organism can interact with its environment. So what it does, necessarily, is to give an *appearance* to something that in fact, in itself, has no appearance. What perceptual appearances are (of course) is just a vast amount of information about the world, information that enables us to survive. Information presented in the form of colors, sounds, tastes, smells, etc. There are structures in the world that correspond to what we perceive, while yet being so radically different as to lack the defining element of what we perceive, namely appearance. (Our complete incapacity to imagine something that (in itself) lacks an appearance only shows how inadequate our cognitive apparatus is to truly understand the world.) Anyway, I just find it mind-bending to contemplate that the brain, by carrying out computations on gigabytes of data it continuously receives, *gives an appearance* to the world. From billions of action potentials you get...a breathtaking sunset.

So far, most of the book I find mind-numbing and almost incomprehensible. All the details about information theory, functions, symbolization, all the mathematics...my brain doesn't ‘function’ in this way. Here's a refreshing and useful paragraph:

The anti-representational behaviorism of an earlier era finds an echo in contemporary connectionist and dynamic-systems work. Roughly speaking, the more committed theorists are to building psychological theory on neurobiological foundations, the more skeptical they are about the hypothesis that there are symbols and symbol-processing operations in the brain. We will explore the reasons for this in subsequent chapters, but the basic reason is simple: the language and conceptual framework for symbolic processing is alien to contemporary neuroscience. Neuroscientists cannot clearly identify the material basis for symbols – that is, there is no consensus about what the basis might be – nor can they specify the machinery that implements any of the information-processing operations that would plausibly act on those symbols (operations such as vector addition). Thus, there is a conceptual chasm between mainline cognitive science and neuroscience. Our book is devoted to exploring that chasm and building the foundations for bridging it.

Useful paper: “Doing Cognitive Neuroscience: A Third Way” (2006), by Frances Egan and Robert J. Matthews. Defends the dynamic-systems approach Gallistel criticizes, but has information on two other dominant paradigms as well. The first is what most neuroscientists do: study what neurons are doing, what goes on biologically at the lowest levels. This is what Gallistel, David Marr, Chomsky, and other cognitive scientists criticize on the following grounds: “The persistent complaints of computational theorists such as

Marr seem borne out, that merely mucking around with low-level detail is unlikely to eventuate in any understanding of complex cognitive processes, for the simple reason that bottom-up theorists don't know what they are looking for and thus are quite unlikely to find anything. Sometimes the problem here is presented as a search problem: How likely it is that one can find what one is looking for, given the complexity of the brain, unless one already knows, or at least has some idea, what one is looking for. At other times the problem is presented less as an epistemological problem than as a metaphysical problem: cognitive processes, it is claimed, are genuinely emergent out of the low level processes, such that no amount of understanding of the low-level processes will lead to an understanding of the complex cognitive processes." That seems plausible to me.

As Marr said, "trying to understand perception by studying only neurons is like trying to understand bird flight by studying only feathers. It simply cannot be done." The neural level only *implements* higher-level cognitive principles and operations. So the other approach, of course, is Marr and Gallistel's, the top-down one. The authors of the article criticize these "cognitivists," on the other hand, for assuming that their account of mental processes will be found someday to "smoothly reduce to neuroscience"—or rather that neural mechanisms of implementation will be discovered—which Egan and Matthews think is false.

If both paradigms are mistaken, there must be a third one, 'between' the two. "The neural dynamic systems approach is based on the idea that complex systems can only be understood by finding a mathematical characterization of how their behavior emerges from the interaction of their parts over time." One possible manifestation of the dynamic systems approach is dynamic causal modeling. "DCM undertakes to construct a realistic model of neural function, by modeling the causal interaction among anatomically defined cortical regions (such as various Brodmann's areas, the inferior temporal fusiform gyrus, Broca's area, etc.), based largely on fMRI data. The idea is to develop a time-dependent dynamic model of the activation of the cortical regions implicated in specific cognitive tasks. In effect, DCM views the brain as a dynamic system, consisting of a set of structures that interact causally with each other in a spatially and temporally specific fashion. [But that's obvious!] These structures undergo certain time-dependent dynamic changes in activation and connectivity in response to perturbation by sensory stimuli, where the precise character of these changes is sensitive not only to these sensory perturbations but also to specific non-stimulus contextual inputs such as attention. DCM describes the dynamics of these changes by means of a set of dynamical equations, analogous to the dynamical equations that describe the dynamic behavior of other physical systems such as fluids in response to perturbations of these systems."

And so on, in the same vein. Eventually: "Let us summarize, briefly, some implications of the neural dynamics systems approach, as illustrated by DCM, for the problem of explaining cognition. Notice first, and most importantly, it explains cognition in the sense that it gives an account of the phenomena in neural terms, emphasizing a break with the 'cognitivist' assumption that to be an *explanation of cognition* is necessarily to be a *cognitive explanation*, where by the latter one means an explanation that traffics in the usual semantic and intentional internals [internal states] dear to cognitivists. Second, the account leaves open the question of whether there is any interesting mapping between cognitive explanations and neural explanations of cognitive phenomena—maybe there is, but then again maybe not..." But if supposedly you can explain cognition without mentioning representations, computations, and all that cognitivist stuff...well then is cognitive science misguided and unnecessary? That hardly seems possible, given its successes. If there isn't a way to bridge the divide between neuroscience and cognitivism, I don't see how we'll ever really understand the cognitive. But I guess this is just another manifestation of the mind-body problem, and as such might be insuperable.

Here's something interesting from Gallistel's book: apparently it's plausible that the brain is able to store a trillion gigabytes of memory, "the equivalent of well over 100 billion DVDs." Gives you some idea of only *one* of the differences between human brains and the most powerful modern computers.

Nice: "We suspect that part of the motivation for the reiterated claim that the brain is not a computer or that it does not 'really' compute is that it allows behavioral and cognitive neuroscientists to stay in their comfort zone; it allows them to avoid mastering...confusion [about all things computational], to avoid coming to terms with what we believe to be the ineluctable logic of physically realized computation." I'm sure that's right. Computer science is damn difficult, and people who have chosen to spend their careers on

something different don't want to have to get into it. (I doubt Gallistel is popular among neuroscientists. "He's challenging the way we do things! Criticizing us! Interloper!")

Summing up chapter 10: "A mechanism for carrying information forward in time is indispensable in the fabrication of an effective computing machine. Contemporary neurobiology has yet to glimpse a mechanism at all well suited to the physical realization of this function." So neurobiology is *very* far from understanding memory. It doesn't even have an inkling of the *mechanisms* yet (much less a fleshed-out understanding from a macro perspective).

Chapter 11 is about the nature of learning. Currently (in cognitive science and its related disciplines) there are two different conceptual frameworks for thinking about learning. "In the first story about the nature of learning, which is by far the more popular one, particularly in neurobiologically oriented circles, learning is the rewiring by experience of a plastic brain so as to make the operation of that brain better suited to the environment in which it finds itself. In the second story, learning is the extraction from experience of information about the world that is carried forward in memory to inform subsequent behavior. In the first story, the brain has the functional architecture of a neural network. In the second story, it has the functional architecture of a Turing machine." Needless to say, the authors favor the second story.

They have a nice little summary of the philosophical/psychological doctrine of associationism, and later behaviorism, that provides the historical and theoretical context for the first story about the nature of learning:

[In Pavlov's classic experiments on dogs,] he was guided by the congruence between what he seemed to have observed and one of the oldest and most popular ideas in the philosophical literature on the theory of mind, the notion of an associative connection. In the seventeenth century, the English philosopher and political theorist John Locke argued that our thoughts were governed by learned associations between "ideas." Locke understood by "ideas" both what we might now call simple sense impressions, for example, the impression of red, and what we might now call concepts, such as the concept of motherhood. He called the first simple ideas and the second complex ideas. Whereas rationalists like Leibnitz believed that ideas were connected by some kind of preordained intrinsic logical system, Locke argued that the connections between our ideas were in essence accidents of experience. One idea followed the next in our mind because the stimulus (or environmental situation) that aroused the second idea had repeatedly been preceded by the stimulus (or situation) that aroused the preceding idea. The repeated occurrence of these two ideas in close temporal proximity had caused a connection to grow up between them. The connection conducted excitation from the one idea to the other. When the first idea was aroused, it aroused the second by way of the associative connection that experience had forged between the two ideas. Moreover, he argued, the associative process forged complex ideas out of simple ideas. Concepts like motherhood were clusters of simple ideas (sense impressions) that had become strongly associated with each other through repeated experience of their co-occurrence.

There is enormous intuitive appeal to this concept. It has endured for centuries. It is as popular today as it was in Locke's day, probably more popular...

The influence on Pavlov of this well-known line of philosophical thought was straightforward. He translated the doctrine of learning by association into a physiological hypothesis. He assumed that it was the temporal proximity between the sound of food being prepared and the delivery of food that caused the rewiring of the reflex system, the formation of new connections between neurons. These new connections between neurons are the physiological embodiment of the psychological and philosophical concept of an association between ideas or, as we would now say, concepts. He set out to vary systematically the conditions of this temporal pairing – how close in time the neutral (sound) stimulus [like a bell ringing] and the innately active food stimulus had to be, how often they had to co-occur, the effects of other stimuli present, and so on. In so doing, he

gave birth to the study of what is now called Pavlovian conditioning. The essence of this approach to learning is the arranging of a predictive relation between two or more stimuli and the study of the behavioral changes that follow the repeated experience of this relationship. These changes are imagined to be the consequence of some kind of rewiring...

The theory of rewiring isn't representational. There is no place for symbolic memory, which means no mechanism for carrying forward in time the information gleaned from past experience.

The authors argue, on the other hand, that "learning is the extraction from experience of symbolic representations, which are carried forward in time by a symbolic memory mechanism, until such time as they are needed in a behavior-determining computation." They argue for this by considering the phenomenon of dead reckoning, a simple computation that (from behavioral evidence) is almost certainly implemented in the brains of a wide variety of animals.

In a later chapter they also take issue with the popular, empiricist-inspired idea that there's a single basic learning mechanism—a "general-purpose learning process"—or at any rate a small number of such mechanisms. They prefer the modular hypothesis rooted in zoology and evolutionary biology, the hypothesis that there are *adaptive specializations*. "Each such mechanism constitutes a particular solution to a particular problem. The foliated structure of the lung reflects its role as the organ of gas exchange, and so does the specialized structure of the tissue that lines it. The structure of the hemoglobin molecule reflects its function as an oxygen carrier..." Adaptive specialization of mechanism is ubiquitous and obvious in biology, simply taken for granted. From this perspective, it's strange that most past and present theorizing about learning is opposed to the idea.

"A computational/representational approach to learning, which assumes that learning is the extraction and preservation of useful information from experience, leads to a more modular, hence more biological conception of learning. For computational reasons, learning mechanisms must have a problem-specific structure, because the structure of a learning mechanism must reflect the computational aspects of the problem of extracting a given kind of representation from a given kind of data. Learning mechanisms are problem-specific modules – organs of learning – because it takes different computations to extract different representations from different data."

Again, all this seems so obvious to me I'm puzzled (sort of) that it's a minority view. The details of the authors' reasoning are sometimes hard to follow, but intuitively their position seems extremely plausible.

Reading excerpts online from a book called *Biology at Work: Rethinking Sexual Equality* (2002), by Kingsley R. Browne. (Also articles.) Is yet another reminder of how ignorant—scientifically illiterate—most feminist "thinking" is on the subject of sex differences. (The typical level of feminist, and more generally politically-correct postmodernist, intellectual laziness is strikingly high. These people—in fact most people—reason on the level of *I like* and *I don't like*, not *The evidence suggests*. That's the cognitive original sin of humanity. To overcome such primitivism is to achieve cognitive maturity.)

Common sense: "Most studies of stereotype accuracy have shown them to be accurate generalizations... Indeed, stereotypes serve the essential function of allowing us to generalize from patterns of information."

Oh well, philosophy is more interesting than this sort of science. Tyler Burge's long essay "Philosophy of Language and Mind: 1950–1990" is very good.

David Montgomery's *Citizen Worker: The Experience of Workers in the United States with Democracy and the Free Market during the Nineteenth Century* (1993).

What Alexander Troup wrote in 1891 applies just as well to the present: "We prate religion... We indulge in morbid sentimentalism over 'happy homes,' we spread ourselves in eagle flights of oratory over our American institutions and the liberty and equality we enjoy under the law, while at the same time we are manufacturing paupers to an extent which places it among our leading industries."

Quite early in the nineteenth century, in fact, the courts were favoring the manufacture of paupers just as much as they do today. As far as they were concerned, Montgomery writes, “the basic principles of the republic required defense of individual initiative in economic life against both governmental and social interference.” He gives an example: “In 1837 the Massachusetts Supreme Court made this clear while reasserting that a farm laborer hired for six months who had quit at the end of five was entitled to no pay. The judges declared, ‘Laborers, and especially that most improvident part of them, sailors, may excite sympathy; but in a government of equal laws, they must be subject to the same rules and principles as the rest of the community; and a court of justice is almost the only place where sympathy should have no influence.’” Yes, that’s one conception of justice, a conception exquisitely suited to a capitalist society. In justice there is no place for sympathy; only impersonal law—in particular a law that upholds class hierarchies, by being grounded in *private property* and *individualism*—ought to be recognized.

“During the next fifteen years [after 1877] state and federal courts vied with each other to underwrite the legal claims of property owners in a market economy against the collective initiatives of working people.” Coal miners, being the most militant, were the most likely to face indictments and convictions for “conspiracy.”

Montgomery sums up his first chapter:

In conclusion, democracy hastened the destruction of onerous forms of personal subordination to masters, landlords, and creditors that American working people had historically faced. The voting rights extended to white male wage earners in the early nineteenth century [by significant portions of the gentry who “were prepared to advance their own political fortunes by soliciting the votes of humble farmers and artisans”¹] provided them with both liberty of action and political influence, which helped them eliminate master-and-servant laws, imprisonment for debt, and seizure of personal property for nonpayment of rent. During Reconstruction the same developments were repeated for southern black workers, though under much more fiercely contested circumstances. [Black workers, of course, had far less success than white workers had earlier. Because of the differences in the labor regimes, or the modes of production, between North and South.]

The new law that replaced the old, however, was defined not by the daily needs of wage earners, but by the emerging requirements of wage contracts for labor, rental of urban housing, expanded circulation of commodities, and the promotion of economic innovation. The legal status of employers and employees was basically defined through common law by the legal profession rather than by elected legislators. [That tradition has continued to the present. Extra-democratic means are necessary to fashion a legal framework for the accumulation of capital by the rich.] Court rulings translated the private initiatives celebrated by Jeffersonian Republicanism into the doctrine of the “free market.” That doctrine, in its turn, enshrined rules established by employers in the legal definition of the wage contract. It also justified severe restriction of the use working people could make of their democratic rights and powers through their own collective initiatives or through governmental action...

In his chapter entitled “Policing People for the Free Market,” Montgomery recounts a revealing incident in Cincinnati, Ohio in 1886. “The city’s employers refused to reduce the hours of labor to conform to a new state law, which made eight hours a legal day’s work. When thousands of workers paraded through the streets to demand obedience to the law, they found their city infested by almost two thousand guardsmen

¹ In other words, it wasn’t out of the generosity of their hearts that members of the elite allowed wage-earners the right to vote. It was because, to quote the always perceptive Tocqueville, “as it was impossible to wring the power from the hands of a people which they [the upper classes] did not detest sufficiently to brave, their only aim was to secure its good will at any price.” The consequence was that “the most democratic laws were...voted by the very men whose interests they impaired.” Another of history’s infinite ironies.

[National Guardsmen], eight Gatling guns, and a battery of heavy artillery—defending the manufacturers who defied the law!” A nice illustration of the real purpose of military and police authorities—not to defend the law but to defend the powerful.

As you know, late in the nineteenth century the courts had quite an array of tools to attack workers. Public exposure of working conditions by the labor press brought suits for libel; state laws that threatened to impinge on companies’ control of their own business affairs were invalidated; but the injunction, of course, was the favorite method to disrupt labor actions. Citywide boycotts of firms, which could be quite effective, were usually judged illegal—for revealing reasons. “While workers defended their hundreds of local boycotts as the sort of private arrangements to promote the common welfare that were favored by America’s Jeffersonian legacy, courts impugned them precisely because their motivation was not self-interested but ‘sympathetic.’ By introducing community moral standards into economic behavior, they charged, boycotts were ‘combinations of irresponsible cabals or cliques’ that threatened to bring ‘an end of government.’” Ha! Morality and sympathy have no place in the capitalist economy, you irresponsible idealists! Whatever isn’t inspired by greed is against the law!

Reading articles in history, to keep abreast of the discipline and have a stock of knowledge for courses I’ll teach. E.g., because I’m teaching a 300-level course on the Gilded Age and Progressive Era next semester, articles on that subject. Rebecca Edwards, “Politics, Social Movements, and the Periodization of U.S. History” (2009). Richard Schneirov, “Thoughts on Periodizing the Gilded Age: Capital Accumulation, Society, and Politics, 1873–1898” (2006). Ballard Campbell, “Comparative Perspectives on the Gilded Age and Progressive Era” (2002). Worth Robert Miller, “The Lost World of Gilded Age Politics” (2002). Elisabeth Israels Perry, “Men Are from the Gilded Age, Women Are from the Progressive Era” (2002). Richard R. John, “Elaborations, Revisions, Dissent: Alfred D. Chandler, Jr.’s *The Visible Hand* after Twenty Years” (1997). James Barrett, “Americanization from the Bottom Up: Immigration and the Remaking of the Working Class in the United States, 1880–1930” (1992). Etc. Also Rebecca Edwards’ *New Spirits: Americans in the “Gilded Age,” 1865–1905* (2015), which I’m using as one of the course’s textbooks.

Fruitful suggestion from Schneirov: “Much of national politics in American history has centered on accommodating the often-divergent interests generated from these modes of production [viz., household, chattel slave, crop-lien sharecropper, small producer or self-employed labor, capitalist, etc.] and stabilizing the succession of ‘mixes’—usually under the hegemony of a dominant mode of production—that constituted the socio-economic matrix of the country in any one period.” He’s quite sympathetic to Marxism.

But then he says this: “Historical research has cast grave doubt on the classical Marxist notion that class conflict—however important—can serve as the central explanation of social change. Whether historians are dealing with the American Revolution, the Republican Party coalition of the 1850s, Progressivism, or the New Deal, it appears that cross-class coalitions consisting of segments of classes and in conflict with other cross-class coalitions transacted fundamental social and economic change.” Duh. So? The idea that class conflict is the central explanation of social change doesn’t imply that different classes have never worked together to achieve common aims.

Typical shallow thinking.

More sensible (thoughts on the Gilded Age):

In the North...the Gilded Age can be defined at its start and conclusion by two important transitions: the first, from a self-employed or free labor mode of production to a capitalist one, and the second, a shift from a proprietary competitive capitalist order to a corporate administered one. While the completion of the first transition helps define the beginning of the Gilded Age, the beginning of the second helps define its close, that is, assuming that we keep the standard years for the Gilded Age, 1870s-1890s. Between these two transitions exists the dominant mode of production in the Gilded Age: competitive, proprietary capitalism, which itself was part of a larger mix including secondary or recessive strains of

self-employed labor, household production, and in the South, large- and small-scale commercial agriculture.

What caused the depression of the 1870s? Not surprisingly—if you’re a Marxist—it has to do with the too-great acceleration of capital accumulation after the Civil War, particularly too much investment in plant and equipment. “According to [Chicago banker Lyman] Gage, testifying before a House committee in 1879 as to the cause of the depression, it had been due to ‘the immense transfer of capital into fixed forms, such as ships, railroads, mines, manufactories, &c’ and was manifested in ‘a large surplus of loanable funds in the banks.’ In 1884, the economist Arthur Hadley directly challenged classical political economy’s dictum that general overproduction was impossible. He traced the 1873 panic and subsequent depression to the much greater investment of capital in fixed forms, mainly in railroad building. ‘[T]he continued existence of such masses of undisposable [sic] surplus may be regarded as the leading difference between the long crisis of 1873 and the shorter one of 1857.’” Bourgeois (and not only Marxist) awareness of the dangers of overproduction thus goes back at least to the 1870s. Economic observers noted that the high fixed costs of many firms forced them to resort to cutthroat competition to cover those costs (which entailed mechanization and attempts to deskill work), causing a series of crises of generalized overproduction between the 1870s and 1890s.

With the Progressive Era, of course, a more managed and more corporate capitalism was born. This is why Rebecca Edwards is wrong that we should get rid of the term ‘Gilded Age’ and call the whole period the Long Progressive Era. She’s right that there were important continuities—as always—but the differences are significant enough to warrant the two separate labels. (And yet, as always, we have to remember it *is* artificial and even obfuscatory to divide history into separate periods, especially if the periods are only a couple of decades long.)¹

Scholars date the decline of a state composed of “courts and parties” and the rise of the regulative state to the Progressive Era. It was then, at President Theodore Roosevelt’s request, that Congress created the model for strong commission government by increasing the powers of the Interstate Commerce Commission, established in 1887. Only after the turn of the century were politicians able to muster enough public support for the sort of administrative mechanisms needed to enforce legislatively enacted regulations. It is nonetheless important to recognize for periodization purposes that it was in the Gilded Age that Americans experimented on all levels of government with major regulatory and redistributive solutions to the problems created by the rise of capitalism.

Change and continuity.

Gabriel Kolko’s classic *The Triumph of Conservatism: A Reinterpretation of American History 1900–1916* (1963). A far more profound book than the vast majority of scholarship on the Progressive Era.

Except in the beginning he does the typical historian thing of arguing that the triumph of conservatism “was the result not of any impersonal, mechanistic necessity but of the conscious needs and decisions of specific men and institutions.” I.e., things could have turned out differently. But the mere fact that developments were the product of men and institutions doesn’t mean there were no impersonal pressures that *strongly constrained* what would happen.

Anyway, “progressivism was initially a movement for the political rationalization² of business and industrial concerns, a movement that operated on the assumption that the general welfare of the community could be best served by satisfying the concrete needs of business. But the regulation itself was invariably

¹ In any case, a better term would be the Long Gilded Age, not the Long Progressive Era. (But both ‘Gilded’ and ‘Progressive’ are flawed labels.) The Long Gilded Age could extend even into the late 1920s.

² By rationalization he means “the organization of the economy and the larger political and social spheres in a manner that will allow corporations to function in a predictable and secure environment permitting reasonable profits over the long run.”

controlled by leaders of the regulated industry, and directed toward ends they deemed acceptable or desirable.” Business control over politics (and not political regulation of the economy) is “the significant phenomenon of the Progressive Era”—and, he might have said, of every other era since before the Civil War.

So big business *desired* federal regulation, in large part to reduce destructive competition between firms. “Ironically, contrary to the consensus of historians, it was not the existence of monopoly that caused the federal government to intervene in the economy, but the lack of it.” Business by its own voluntary measures, such as mergers, hadn’t succeeded in rationalizing the economy. Its leaders realized that only the national government could accomplish that purpose.

Another reason for federal regulation was that, in its conservatism, it could be a “bulwark against state regulations that were either haphazard or, what is more important, far more responsible to more radical, genuinely progressive local communities. National progressivism, then, becomes the defense of business against the democratic ferment that was nascent in the states.” An ironic and original thesis, in light of the conventional wisdom that federal legislation usually has a more progressive thrust than state legislation.

Despite the merger movement between 1897 and 1901, “the first decades of the century were years of intense and growing competition.” Giant corporations often didn’t even do very well, making mediocre profits. A financial journal observed in 1900 that “the most serious problem that confronts trust combinations today is competition from independent sources... In iron and steel, in paper and in constructive processes of large magnitude the sources of production are being multiplied, with a resultant decrease in profits...” Kolko proceeds to show in a series of “case studies” (of particular industries) that competition in the early years of the new century was growing: in iron and steel, oil, automobiles, agricultural machinery, copper, meatpaking, and the telephone industry. (Also paper, textiles, glass, chemicals, insurance, etc.) The public outcry over “monopolies” wasn’t wholly without cause, but it was essentially confused.

Kolko’s discussion of meat inspection is revealing. Decades after the publication of his book, we’re still taught that Upton Sinclair’s *The Jungle* almost singlehandedly led to a great victory over the evil Beef Trust, when the Meat Inspection Act of 1906 was passed. It was the epitome of the Progressive struggle against big business, and a remarkable populist triumph. The reality is that the major meatpackers were the most ardent supporters of regulation, and had been agitating for better regulation for at least twenty years. “The most important catalyst in creating a demand for reform or innovation of meat inspection laws was the European export market [i.e., the business of exporting meat products to Europe] and not, as has usually been supposed, the moralistic urgings of reformers.” Throughout the 1880s the major European countries banned American meat because of diseases, and the cost to the large American packers was enormous. Finally Congress passed a major meat inspection law in 1891, which opened up the European market. But then European packers who didn’t appreciate the competition pressured their governments to impose new medical standards to keep excluding some of the meat. Another law in 1895 provided for even greater enforcement. But the government system still failed to reach smaller packers, and the big ones resented this competitive disadvantage. They wanted to deepen and extend regulation. So, in a sense, *The Jungle* only helped their cause. The American Meat Packers’ Association supported the bill that was eventually passed, in fact lobbied successfully to get one of the only provisions they didn’t like taken out of the original version, that the packers themselves would have to pay for the costs of inspection. Nor did the bill say anything about working conditions, which is what Sinclair had been most concerned with. So in every respect it represented a triumph for the meatpackers. (Actually, the American Meat Packers’ Association continued in later years to agitate for *more* regulation, but it was unsuccessful.)

It was similar with the Pure Food and Drug Act, passed the same year. Major food interests had lobbied for regulation “in order to set their own houses in order and protect themselves from more unscrupulous associates,” and they supported the bill.

As for Theodore Roosevelt, despite the myths, he wasn’t much of a reformer. He was far more conservative than even his cousin Franklin Roosevelt. Didn’t care much about the pure food and drug question, cared about regulating meatpacking largely because business supported it, cared less for the *conservation* of nature than for preserving it for utilitarian economic ends (at least according to Kolko),

and, despite his rhetoric, didn't even care deeply about the antitrust issue (except with regard to Standard Oil). "The antitrust activity of Roosevelt's administration was purely minimal, and substantially less, in terms of the number of cases initiated, than under Taft or Warren G. Harding." In addition, he had contempt for muckrakers, and was instinctively well-disposed toward nearly the whole of the business community. Kolko also gives convincing evidence that he was more anti-labor than such business groups as the National Civic Federation and the 'House of Morgan.'

Meanwhile, during Taft's presidency business continued to press for greater federal regulation of prices (to eliminate destructive price wars) and other matters, a stronger Interstate Commerce Commission, major banking reform, etc. The trade association movement heated up in order to facilitate price, market, and output agreements between businesses in competitive industries (agreements that were of questionable legality because of the Sherman Act, which most of the business community therefore wanted amended or repealed). Within a couple of decades the U.S. economy—like other Western economies—was riddled by many hundreds of trade associations.¹

In short, what was desired was ever greater fusion of business with government, in the formally fascist fashion that was already becoming the norm across the Western world (and would eventuate in Fascism and Nazism, and more generally in numerous varieties of state capitalism).

The banking reform movement that culminated in passage of the Federal Reserve Act was, of course, organized by bankers and served their interests. As Kolko says, it "was initiated and sustained by big bankers seeking to offset, through political means, the diffusion and decentralization within banking"—the competition of innumerable state banks and smaller banks around the country, and the relative decline of New York as the center of finance. There was also growing financial instability, which culminated in the panic of 1907. The Federal Reserve System was the solution. "The trend in the national banking system until 1913 was toward a reduction in the bankers' balances and individual deposits in New York, and in favor of the relatively more rapid growth in the Midwest and West... The Federal Reserve System, for the most part, stabilized the financial power of New York within the economy, reversing the longer term trend toward decentralization by the utilization of political means of control over the central money market." Thus, another quintessentially "Progressive" achievement was quite conservative in its aims and consequences.

So were the Clayton Antitrust Act and the Federal Trade Commission Act, both passed in 1914. "Big business as a whole was very pleased, to put it mildly, with the new state of affairs. The provisions of the new laws attacking unfair competitors and price discrimination meant that the government would now make it possible for many trade associations to stabilize, for the first time, prices within their industries, and to make effective oligopoly a new phase of the economy. In part the new mood of confidence was a result of the President's repeated assurances that he favored a conservative approach to business...and a realization that a Federal Trade Commission was to serve as a stabilizing factor in the economy and a protector against public attacks. The unions were no better off, despite Gompers' effusive support of the Clayton Act, and the last stone in the foundation of a comprehensive political capitalism involving the banks, railroads, and industry had been laid."

All the public outcry against corporations and monopolies had eventuated in laws that in their essentials were exactly what big business desired. As usual, the rich were able to channel popular unrest to their own ends, while yet declaring that the public's aims had been realized. "In its larger outlines it was [politically oriented big businessmen] who gave progressivism its essential character. By the end of 1914 they had triumphed, and to the extent that the new laws were vague and subject to administrative definitions by boards and commissions, they were to totally dominate the extensive reign of political capitalism that had been created in the United States by 1915."

¹ We see, once again, that, contrary to panegyrics penned by the public relations industry, what business really wants isn't a "free" market but a *controlled* market. That can be thought of as one of the central points of Kolko's book. The hatred of the market is so extreme that some businessmen, for instance Andrew Carnegie and Elbert H. Gary (head of U.S. Steel), actually advocated government price-fixing!

A useful statement in the concluding chapter: “National progressivism was able to short-circuit state progressivism, to hold nascent radicalism in check by feeding the illusions of its leaders—leaders who could not tell the difference between federal regulation *of* business and federal regulation *for* business.”

Another useful statement:

Historians have continually tried to explain the seemingly sudden collapse of progressivism after the First World War, and have offered reasons that varied from moral exhaustion to the repression of nonconformity. On the whole, all explanations suffer because they really fail to examine progressivism beyond the favorable conventional interpretation. Progressive goals, on the concrete, legislative level, were articulated by various business interests. These goals were, for the most part, achieved, and no one formulated others that big business was also interested in attaining. Yet a synthesis of business and politics on the federal level was created during the war, in various administrative and emergency agencies, that continued throughout following decade. Indeed, the war period represents the triumph of business in the most emphatic manner possible. With the exception of a brief interlude in the history of the Federal Trade Commission, big business gained total support from the various regulatory agencies and the Executive. It was during the war that effective, working oligopoly and price and market agreements became operational in the dominant sectors of the American economy. The rapid diffusion of power in the economy and relatively easy entry virtually ceased. Despite the cessation of important new legislative enactments, the unity of business and the federal government continued throughout the 1920's and thereafter, using the foundations laid in the Progressive Era to stabilize and consolidate conditions within various industries. And, on the same progressive foundations and exploiting the experience with the war agencies, Herbert Hoover and Franklin Roosevelt later formulated programs for saving American capitalism. The principle of utilizing the federal government to stabilize the economy, established in the context of modern industrialism during the Progressive Era, became the basis of political capitalism in its many later ramifications.

In this sense progressivism did not die in the 1920's, but became a part of the basic fabric of American society...

I like Thorstein Veblen's remark that the U.S. Congress is little more than a “Soviet of Business Men's Delegates.” Exactly!

Here's a random email about the Russian Revolution I sent in response to a few others, which I put here because it clarifies for you some of my attitudes:

Yes, Kerensky stood firm on certain issues and at certain times, but he was indecisive at crucial moments, which ultimately allowed for the success of the Bolsheviks. He was indecisive, for instance, in the weeks and days leading up to the coup. Christopher Read's book gives a lot of evidence.

Of course it's true that every event in history depends on contingencies. [I had said the Russian Revolution depended on a series of accidents, and my interlocutor had replied that's true of everything in history.] The point is that the transition from capitalism to socialism is supposed to happen virtually by necessity (as Marx argued in the Manifesto and other writings, and as the logic of his system entails), as developing productive forces burst the shackles (through the agency of the working class) of fettering production relations. This is why the transition was supposed to happen in an advanced capitalist state, not a backward semi-feudal one.

One can call the Russian Revolution a genuine revolution if one wants, but that's largely a terminological dispute. The point is that it wasn't and couldn't have been a revolution in any properly Marxist sense of the term, for a number of reasons. A Marxist "revolution"--which can take place over decades or generations, since it really just means a transition between different modes of production--would involve a transcending of the exploitative, authoritarian structures of capitalism and an unleashing of the productive potential shackled by capitalist property relations. Since most of Russia wasn't even capitalist or industrial in 1917, it's hard to see how the revolution could have been of this *post-capitalist* type. The Bolsheviks themselves puzzled over this, of course, concluding that the only way it could succeed would be if revolutions happened in more advanced states, so that the building of socialism in Russia could be coordinated with and assisted by the revolutions elsewhere. This hope faded after a few years.

More fundamentally, though, a transition to socialism--a necessarily *international* transition--could never have happened at that time. Conditions just weren't ripe. (They aren't even ripe yet, though some decades from now, in the era of capitalism's total decrepitude, they might be.) I've argued this point at length in the book. I have to say that in a sense I think I'm practically the only real Marxist around, since I share Marx's belief--which is very unpopular today--that there is a kind of logic and 'necessity' to historical evolution. A lot of leftists think "oh, if only things had gone a little differently, if we had had stronger leaders and so on, we could all be living in socialism or communism now!" That's not how history works. Events on the scale of a global transition between different modes of production don't depend on the will or abilities of a few leaders. They depend largely (though not exclusively) on the '*internal logic*' of *economic and political institutional change (given particular levels of technology, etc.)*. This is what "dialectics" is. This is why Marx thought it would be fruitful to investigate the logic of capitalist development, since he thought it would show why a transition to socialism would have to happen and *wouldn't* depend only on personalities, luck, etc. Of course the *way* it actually happened would; but *that it must happen* wouldn't. So the fact that a transition to socialism didn't happen a century ago itself shows it *couldn't* have; because if a transition ever does happen, it will be a result of something like historical *necessity*. The "necessity" of development through "dialectical contradictions" and so on. The only thing leaders can do is to speed up the process, make it more conscious and wholly *constructive*, reduce the amount of suffering during the long transition, etc.

This is why I critiqued Leninist "voluntarism" in the book. Voluntarism isn't Marxian. The principle of *individual will* (the will of a few leaders) and the principle of development through the systemic resolution of contradictions are opposed. The first is conscious and extra-systemic, the latter primarily unconscious and intra-systemic. I don't think Leninists really understand Marxism. In a sense even Marx didn't fully understand his theories, as I've argued in the book, since he had faith that a "proletarian dictatorship" would be able to *consciously direct* the long transition--despite his acute insight that historical actors never really understand the true significance of their acts! I think he suspends his whole dialectical method when it comes to his belief in a consciously willed, top-down, straightforward reconstruction of the economy from capitalist to socialist. Not only is such a belief unrealistic; it isn't even Marxian.

As I said in the excerpt, if a transition ever does occur, it won't involve only a few political parties that take over various states and direct everything from the commanding heights. It'll take place over many generations and will involve everything from national parties to local grassroots groups, from the proliferation of cooperatives to nationalization of major

industries, from the laborious interstitial expansion of the solidarity economy to "consciously willed"--carefully thought-out and directed--plans akin to those of Jeremy Corbyn's Labor Party in its manifestos. It'll have very little in common with the Bolshevik seizure of power in a late-feudal country. As I said, I think the main lessons of that experience are in how *not* to do things.

It's time we all stopped being dazzled and seduced by 1917. It was a historical accident that led to decades of horror. It wasn't and never could have been a truly socialist revolution. We should let the dead bury the dead and focus on the tasks at hand, in conditions radically different from those that confronted Lenin.

Nancy MacLean's bestseller *Democracy in Chains: The Deep History of the Radical Right's Stealth Plan for America* (2017) deserves the attention it's gotten. It's an excellent and wonderfully pugilistic book. MacLean is a bare-knuckle boxer—and she's right: in 2017-18 it's time we took the gloves off.

January–March, 2018

This semester teaching courses at three colleges. An online class on the Gilded Age and Progressive Era in the U.S.; a class on U.S. history after the Civil War; and classes on World History to 1500 and Western Civilization to 1500.

Reading Ellen Meiksins Wood's brilliant *The Origin of Capitalism: A Longer View* (2002). A Marxist account highly sympathetic to Robert Brenner's interpretation. Gives commentary on the old debates and elaborates a rather persuasive 'new' perspective, according to which the question isn't how market *opportunities* arose in early modern times—for there have been market opportunities throughout history, despite the absence of a truly capitalist dynamic—but how market *imperatives* arose. For it is the *imperative* that producers are subject to the market that distinguishes the capitalist economy from all previous systems and makes its growth *self-sustaining* (at a compound rate, as David Harvey would add). Other theorists have tended to focus on how feudal *obstacles* to capitalism were overcome in Western Europe—for instance, how urban trade undermined feudalism—but this makes it seem as though producers simply had to be liberated from shackles in order finally to be free to become capitalists. The point, though, is that the rise of capitalism had less to do with "freedom" or "opportunities" than with *subjection to market imperatives* (or *coercion*)—of a kind that had never really existed before. For the first time, producers, on a wide scale, couldn't acquire the means of living except through ruthless economic (*not political*) competition. (The economy became its own separate sphere sundered from politics, subject to a strictly market-based logic.) So how did a system of market imperatives come into being?
